With the swiftness and ferocity of a wild animal, Christian crossed the room towards Mr. Orchardson, who shrank back as if apprehending personal violence. But though his clenched hands were raised trembling in the air, he struck no blow.

"Your son hath betrayed my sister, and killed my mother, who lieth yonder. No matter where he is hiding, I shall find him. No matter how long I may have to wait, I shall kill him; and I should kill you this night, for the wrong you did my father, if I did not wish you to live to see my vengeance on your son—to see him lying dead before you—killed by my hand."

The old man shrank back in horror, less at the words than at the expression on the speaker's face.

"Wretch!" he gasped, "I will swear the peace against you. The law—"

"No law will save your son from me. It will be life for life, and may God's curse blind me if I do not as I have sworn! Now begone!"

Christian pointed to the door. With an exclamation, half-angry, half-fearful, Mr. Orchardson shrank away before the outstretched hand, and tottered out into the night, closing the hall door with a crash behind him.

After these events, Priscilla and her father start for America in the ship *Miles Standish*. Richard Orchardson goes with them as a passenger; Christian, under an assumed name, as a deck hand. Christian is very justly put in irons for a murderous attack on Orchardson, Priscilla intercedes for him with the kind-hearted captain (whose American talk says little for Mr. Buchanan's power of observation or research), and while Christian is still in irons Orchardson fires the ship. The boats are got out, and their occupants are picked up by a ship commanded by a Dutch skipper, who is about as Dutch as the other skipper is American; they get astray into the regions of ice, and are beset by flocks; and finally Christian and his enemy are left alone together on a desert shore. What happens then it would be hardly fair to the author to tell. His description of it seems to be meant for the capital part of the book, and is, it seems to us, more high-flown and less successful than what has gone before. It is here, too, apparently that "the heresy of instruction" is intended to have a special force, which to some readers it may or may not seem to have. To our thinking, this part of the work is even more frothy, more pretentious, and more unpleasant than the rest.

#### HINDU SOCIETY.\*

THE writer of this work would doubtless, if he had been born and lived in England, be termed by friends and foes an advanced Liberal. He is a Hindu gentleman, a native of Lower Bengal, and a member of one of the three great houses or clans which, by popular consent and unimpeachable tradition, are known as the Kulin Kayasts of Bengal. They are called Bose, Ghose, and Mitra. There is a story that when, some eight hundred or a thousand years ago, a monarch of Upper India sent down to Bengal five virtuous and learned Brahmins to revive the dying fires of a decaying Hindu faith, these reformers were accompanied by five excellent servants, who in their turn became the heads of the Kayast or writer caste. Inevitably, however, this caste split up into further ramifications, and the descendants of those ancient missionaries—for such in one sense they were—are now divided into three large groups, of which the first comprises three, the second eight, and the last seventy-two houses. Members of this caste, especially those of the first two divisions, are amongst the most useful and efficient of our public servants in India. They are to be found, ambitious and hardworking, in every department of civil life, as Inspectors of Police, as Assistant Surgeons, as clerks in the Secretariat, as accountants in the Treasury, and they are highly valued in mercantile establishments by reason of their neat penmanship, good habits of business, and knowledge of arithmetic. One of the most practical chemists of his generation is a Doh, one of the eight houses of the second group. Two native judges of the High Court at Calcutta have been selected from the *ghos* Mitra. Brahmins may easily surpass the Kayasts in erudition, and the former class has produced Oriental statesmen who for acuteness, tact, versatility, high breeding, and ability to discuss political problems with Englishmen on something like a footing of equality, may be termed the ablest of our Aryan kinsmen. But for readiness to adapt themselves to every phase of officialdom and general usefulness, we doubt much if any body of men can excel the Kayasts of Bengal.

We are not certain whether the writer of this volume has ever held any important public office; but it is clear that he has so mastered English thought and literature that he may fairly be termed, in the words of Dean Stanley in his *Jewish Church*, a link

between "the immovable repose of the Oriental and the endless activity and freedom of the Occidental World." He was brought up originally in the Institution of the General Assembly at Calcutta, when, before the secession of the Free Kirk in 1843, it was under the management of the first missionary of his age, the late Alexander Duff. He is old enough to have witnessed a Suttie in the person of his own aunt, and this fact alone must take him back to a period antecedent to 1829. As a witness to native customs and peculiarities his testimony is unimpeachable; and one valuable characteristic of his work is that he prefers to lecture his own countrymen on their shortcomings rather than to patronize condescendingly the Anglo-Indian administration to which he and many more owe everything that makes their life worth living. No one objects to know what Hindus and Mohammedans really think of a foreign rule. There is not an able statesman or administrator, from Chittagong to the Derajat, who would not be glad to know where exactly the Anglo-Indian shoe pinches the Oriental foot; what forms of taxation are most tolerable to the community; what evils may be best left to time and education, and what imperatively demand the interference of law. But very little is to be got at in this direction from the pert addresses of "Young Bengal," who, whether in the Town Hall at Calcutta or from a lofty platform in the Strand, condescends to criticize the inferior civilization of England and to inform his benighted rulers how much they have yet to learn. From this priggishness, fostered unhappily by English gentlemen and ladies, Shib Chunder Bose is happily free. Another gratifying feature of the work is a commendatory preface from the Scotch divine who is now at the head of the General Assembly's Institution. We do not apprehend that there is any chance of the author's conversion to Christianity, but the kindly feeling existing between him and a gentleman whose avowed object is the dethronement of Hindu superstition is noteworthy; and it is quite certain that the purpose of the writer is fearlessly to expose domestic immorality, ruthlessly to sweep away childish, antiquated, and degrading superstitions, and conclusively to show that the result of a sound English education ought really to be something beyond vague manifestoes about improvement and pompous talk of reform. On the other hand, no one must take up the book under the impression that he will thereby be initiated into the mysteries of Eleusis, and we have been amused by a criticism in the columns of a weekly contemporary, who complains that a perusal of this work yielded him nothing but disappointment. We must take these disclosures exactly as they are intended. Here is no material for any Oriental novel; nor must we expect luminous disquisitions on the "points of contact" between the East and the West. But, without ministering to pruriency or making shocking disclosures which a naughty society would rush to read, the veil is removed from the *Zenana*, and we have an enumeration of the ceremonies practised at the birth of a Hindu, at his assumption, if a Brahman, of the sacred thread, at his marriage, at his death, and at the *Shraddha*, or sacrificial supper to deceased relations. The details of each of these events, as well as the ceremonies of cherished national festivals, such as the Durga and the Kali Puja, are given with a fulness and a minuteness to which no Englishman can pretend. The female side of a respectable native house is, we need hardly say, sealed against all Englishmen. The writer of this review, like others of his countrymen on rare occasions where the law is invoked, has been admitted in the presence of the father and a family priest, to speak with a Bengali lady of the highest caste, through the intervention of a thin curtain, and has been allowed to satisfy himself that she was not, as alleged, under any sort of illegal restraint or compulsion. But to enter the precincts of the *Andar Muhāl* or *Zenana* is reserved for English ladies only, and such have been witnesses of the staid demeanour of the *Mu Thakoorani* or old lady at the head of the household, and the bright eyes and intelligent looks of the younger members. On such occasions Soudamani or Braja Sundari have been known to scream with delight when the wife of the Judge or Commissioner has taken off her dark-coloured glove, and have pestered her with questions about the exact value of her ornaments and the affection of her husband.

It would be almost presumptuous in any Englishman, whatever may have been his facilities for mixing with natives, to criticize the native phrases and expressions with which this volume overflows, or to pretend to set the author right where he says when sweetmeats are to be brought round, when betel must be chewed, or what part of the person is to be smeared with turmeric. No doubt the descriptions of public and private ceremonies have, as we are informed in the preface, been vouched for by natives of a younger and no less highly educated generation. The author's name and position, we are confident, are guarantees for the accuracy of every formula; and he could, if required, explain critically and grammatically the meaning of every Sanskrit phrase. But we are bound to say that some of his renderings in English are loose, vague, and inaccurate, and that it would be extremely risky for any person unacquainted with Sanskrit and its derivatives to take some of the expressions away from the context and employ them confidently elsewhere. For instance, we are told that "in the villages *Chanaka Sloka*, or elementary exercises, are still given as a sort of moral exercise." A *Chanakya Sloka* is really a couplet in pure Sanskrit, taught by the village dominie to little boys by word of mouth. Some of these couplets may be found in *Mann* or in the *Mahabharata*. The majority were never committed to writing at all, but have been handed down from father to son, and are repeated by ordinary natives ignorant

\* *The Hindoos as They Are: a Description of the Manners, Customs, and Inner Life of Hindu Society in Bengal.* By Shib Chunder Bose. With a Prefatory Note by the Rev. W. Hastie, B.D., Principal of the General Assembly's Institution, Calcutta. London: Edward Stanford. Calcutta: Newman & Co. 1881.

of the very rudiments of Sanskrit grammar, and only just able to write a decent Bengali petition or letter. Some years ago the late Dr. Haeserlin, an erudite German long resident in Bengal, printed a collection of these Chanakya couplets. Several were very pretty; some were original and quaint; and a few were positively indecent. *Debattar* land is by no means "inalienable" property. Originally it meant land dedicated to the service of a god or a temple, just as *Brahmattur* means a piece set apart for the livelihood of Brahmans. But hundreds of both kinds of these tenures pass from the holiest and highest castes and purposes to the lowest ranks and objects, and are enjoyed without any religious service and by all classes of Sudras. *Lajar bustur* is not exactly a silk cloth put over the heads of a betrothed couple. It means "a garment of modesty," and should be written *Lajjar batra*. *Kali maikay jay* should be *Kali ma ki jay*, "Victory to Mother Kali." It is the psalm of a regiment of Sepoys. *Britha*, applied to the flesh of a goat or sheep, means, no doubt, that it has not been properly "sanctified" by an oblation. But the correct signification is "idle" or "vain." Kishnagar, once the favourite retreat of Sir William Jones, is not a hundred miles from Calcutta, but sixty. Neither is Tribeni in the district of Hooghly, east of the metropolis, but west or north-west. *Nay bidhi*, or an offering made to an idol and then distributed to Brahmans, ought to be *Naivedyo*. Simla, a suburb of Calcutta, should be written *Simla*, to distinguish it from the well-known sanatorium, or Capua as some editors term it, in the Hills. *Bidhay* is not exactly "a gift," but the signal for taking leave, often, it is true, accompanied by a gift. Bridegroom and bride should be *Bar Kanya*, and not *Konay*. A yellow garment is worn at the Saraswati Puja; not *basanti*, the original adjective, means "of the spring," and not "yellow." Finally, while we note that the author correctly revives an epithet which was applied in India to the late Mr. George Thompson, M.P. for the Tower Hamlets, who was almost the first senator who went to India on the "stump" and in search of a "grievance," we are happy to inform him that the epithet "late," as applied to Dr. Jackson, is premature. That well-known Calcutta physician is still, he will be glad to learn, alive and well in England.

We must refer readers anxious for minute information about the Hindu ceremonials which are performed by man and wife—*inter utramque faciem*—to the book itself. It is impossible to give more than an idea of their contents. Very likely relatives permit themselves the use of expressions at the marriage rite which would better become the mouth of Squire Western at the nuptials of Sophia, or of His Majesty James I., as Scott tells us, at the union of Richie Monipplies with the usurer's daughter, Martha Trapbois. But a word or two on some of the festivals may not be out of place. The investiture of a young Brahman with the *poita*, or *janowr* (a contraction of the Sanskrit *yagnopavit*)—i.e. the sacrificial thread—is analogous to the assumption of the *toga virilis* of a Roman patrician. The almanac is consulted for an auspicious day. The lad is shaved, washed, and clothed in red. The staff of mendicancy is placed in his hand, and he assumes for a moment the dress and character of a *Brahmachari*, or religious student, at the service of a spiritual guide, as prescribed by Manu. He repeats a sacred text, goes through the form of alms-begging and pretending to renounce the world, and then, at the earnest request of his family, returns to his scholastic or secular pursuits. In this and all other ceremonies an enormous amount of sweetmeats is consumed. Nothing, in fact, is ever done without the addition of these delicacies, and some of them, it must be admitted, though cloying to the taste, are far superior in quality to the pink and white abominations sold by our own petty grocers. The festivals termed those of the "brother" and "the son-in-law" are described in short but pleasing terms, and it is surprising but satisfactory to learn that "the mother-in-law," so far from being looked on as a natural enemy, is an object of reverence and honour to the youth who has married into the family. A very large space is devoted to the festival of the goddess Durga, established in commemoration of the aid which she is said to have given to the hero Rama in his fight with Ravana. But this festival, though marked by prayers, offerings, much firing of guns, lavish sacrifices of goats, sheep, and buffaloes, and vast consumption of milk, curds, and the inevitable sweetmeats, is as much a time of social relaxation and enjoyment as of formal religious worship. The civil courts are shut for six or eight weeks. The Treasuries, criminal courts, and public offices are closed for eleven days. Every Hindu employed in a Government or mercantile office, from the judge of the Small Cause Court to the copyist earning a few rupees a month, has leave to go to his home. The Anglo-Indian community in the plains avails itself of this vacation to rush impetuously to the Hills, or to visit the Andamans, Rangoon, Ceylon, or the Straits Settlements. Occasionally it has been asked why this vacation could not be deferred to the cold season, coincident with Christmas and the New Year. The answer is simple and conclusive apart from any religious question. Everything in the cold season is in full swing; work, amusements, the enterprises of the commercial community, the tours of the official under canvas through the district or the division. Life is too full to admit then of long holidays or closing of the courts. The *Durga*, taking place in September or October, comes at the very best time to afford rest and relief to a hard-worked community. It enables thousands of persons—white, black, and parti-coloured—to have a complete change of scene at the most unobtainable part of the year. They can go away from banks, counting-houses, and offices, for a month or so during the stifling heats of autumn, returning refreshed for the first

whiff of a cooler breeze sent direct to the plains, through an unclouded atmosphere, from the summits of those hills on which Mr. Whymper is popularly believed to be meditating an attack.

This volume comes to us with a deeper signification than appears on the surface. The distance which separates the grey-haired reformer of 1881 from the lad who, half in curiosity and half in terror, accompanied a savage mob to see his relative burn on her husband's funeral pile, is not to be measured by a mere half-century. Bentinck would have been glad to recognize in this Bengali gentleman a native who justified his beneficent reforms; and Englishmen who remember the obstacles encountered forty-five years ago by Macaulay, Duff, and Trevelyan will admit that there is some hope for the Hindus of Bengal when their follies and extravagances are frankly and fairly criticized and held up to reprobation by one of themselves.

#### KOUMISS.\*

IT is said that if a calf, starting from the Great Wall of China, travels steadily westwards, feeding as it goes on the grass of the steppes, it will eventually arrive in Russia thriving, but no longer a calf—it will be a cow. The same journey might be reversed. The calf might go eastwards from the Volga, and find itself a cow in China. Over the immense space of ground which that Mongolian it would cross, there blow in summer the most exhilarating of breezes. There also grows profusely one of the most interesting of grasses, the covil grass, or *penna stipata*. During the month of June, the covil grass is in flower, and the whole immense plain is often a sheet of flower-bearing herbs, impregnating the atmosphere with an aromatic perfume. On this grass feed innumerable flocks of horses and mares, and its flower communicates to the milk of the mares a certain aromatic quality. Out of the milk is made what the wandering tribes of Tartars consider as their nectar or ambrosia, or *soma*. This Tartar nectar is known by the name of koumiss, and the koumiss which is drunk at this time of the year has, it seems, a peculiar virtue of which even koumiss at other times cannot boast; moreover, the drinkers of koumiss at this time of the year draw from their potations a power which, it is said, enables them to set at defiance—apparently, at least—most of the woes that distress mankind, whether mentally or physically. Up to the present time little has been known in the West of Europe of this Tartar ambrosia; but no one in England need now be ignorant of it, since it has been brought prominently before our notice by Dr. Carrick in his work recently published on the subject.

There are few more popular themes in folklore tales than the resuscitation of dead heroes, or at least the curing of apparently fatal wounds. Such cures as are mentioned in popular stories are stated by Dr. Carrick to have been worked in the circle of his own acquaintance. Persons whose lives were apparently threatened with immediate extinction, men whose constitutions had given way under hardship or distress, women whose frames appeared to be utterly shattered, have left St. Petersburg, or whatever other Russian city they might happen to inhabit, apparently doomed to die in the distant province to which they were sent. A few months later they have returned home sound, healthy, even robust. The cure has been worked by the koumiss in its native land at its fitting time. The Tartar drink has proved for these persons, who were apparently destined to death, a true water of life. Not very long has its extraordinary power been known, but gradually of late years its fame has been extending. In future it seems likely to play a more prominent part in therapeutics; and it may be that the time will come when excursion trains will run (with compartments reserved for consumption) to the steppes of Samara, bearing pale gaunt forms, which will return in the autumn rendered by robustness unrecognizable to their dearest friends. It may be well, therefore, to give English readers some idea of where they will have to go, how they will have to live, and in what manner they will spend their time while they are being cured.

To begin with the route. Every one knows how to go to St. Petersburg; it will be enough to say a word in favour of the journey through Sweden. From St. Petersburg to Moscow is very easy travelling; but the koumiss-bound traveller will stop half-way at a station where he will have to wait several hours in the middle of the night. Thence he will be conveyed comfortably to Rybinsk. From that town he will float tranquilly down the Volga without let or hindrance, until he reaches, after a considerable time, the neighbourhood of the spot in which his cure is to be effected. Not far from the town of Samara, on the edge of the wide-stretching steppe, where the wind blows fresh from its limitless journey, where the covil grass blossoms in June, several establishments have been founded for the treatment of patients by koumiss. A writer in the *Novos Premys*, who visited these establishments last year, gave an interesting account of what he saw, and had only a few faults to find with the management of the koumiss establishments. The rooms might be more comfortable, it seems; the beds might be softer, and sometimes cleaner. The food might decidedly be better; but this does not matter much, for the koumiss-drinker is endowed with a wonderful appetite. Comfort is a word which does not

\* *Koumiss*, or, *Fermented Mare's Milk, and its Use in the Treatment and Cure of Pulmonary Consumption and other Wasting Diseases*. By George L. Carrick, M.D., &c. Edinburgh and London: Blackwood & Sons, 1881.

come home to a Russian as it does to an English ear, and comfort at present can scarcely be looked for. But there are other attractions. All day long, what the Russians call "the dear red sun" blazes steadily in the heavens; all night long the wind of the steppes blows fresh and cool and somniferous. The views, if mountainless, are still grand from their extent, and soothing from their flatness. At night the stars shine as they shine only out of England. But the great charm of the spot is the beverage which the visitor to it consumes. There is koumiss everywhere. It is drunk all day long. It renders days happy and tranquil, producing a sense in the drinker's mind of its always being afternoon. At night the koumiss-drinkers sleep the sleep of the demi-semi-inebriated. Every morning when they rise they feel themselves better and fatter than they were yesterday. Every day their long-famished forms are gradually assuming the proportions of rude health. The establishments are at present filled almost exclusively with Russians. As yet but few foreigners have made their way to this enchanted land. One English traveller has, however, made his impressions public. The reader may be referred to the book on the Volga by Mr. Butler Johnstone, formerly member for Canterbury. Russians, it has often been remarked, have a good deal of the childish element in them, and when a hundred Russians are brought together to spend the day in drinking koumiss, they exhibit the best qualities of children. They are gregarious, lively, amusing, and always ready to talk and tell stories. The visitor who is acquainted with the Russian tongue will find ample opportunities for exercising his somewhat rare accomplishment. There is plenty to do, but the great thing to be done is to drink koumiss. When "koumissniks" meet after the day's work is done, the conversation (says Dr. Carrick) "almost always turns upon the quality of the fermented milk of that day, and the quantity each person has been able to consume." Their capacity for drinking varies with the temperature; but, on an average, each invalid consumes five bottles a day—"vigorous drinkers reach as high a figure as eighteen." The cost is about sixpence a bottle at Samara. When transported to St. Petersburg the price is trebled, and transported koumiss often disappoints the expectations which have been formed by persons who have performed a similar operation to quaffing "the pendent vintage where it grows."

As regards the effects of koumiss on its drinkers, Dr. Carrick's cases are numerous. We select one at random. "A young lady of 19, who had lost a brother and a sister of galloping consumption, became herself so ill that by the spring of 1874 she was unable to leave her bed, and at a consultation where several physicians were present it was decided, and quite rightly, too, that it would be better to pass the few remaining days of her life in the midst of her family." She insisted upon being conveyed to the steppes, "contrary to the advice of parents, friends, and the majority of her medical advisers." For the medical details of her cure the reader may be referred to page 258 of Dr. Carrick's book. Suffice it to say that he tells how, in the month of July 1875—i.e., after she had been fourteen months under treatment with koumiss milk—he "danced a quadrille, a waltz, and a polka with her during a single evening." It is true that she died in July 1876; but her life had been wonderfully prolonged by a treatment which, if taken earlier, might probably have saved it. Here is another case. A patient was so ill that the coachman who conveyed him to his destination breathed a sigh of relief at the end of the journey, and, piously crossing himself, observed, "Well, sir, I never thought I would get you this length alive." Dr. Carrick made this gentleman's acquaintance a year afterwards, "when he was energetically leading a country dance." He visited the steppes five summers in succession, and made a complete recovery. "He was never troubled with hæmoptysis after he commenced the koumiss cure." But we will give no more cases. Let every one who is interested in a consumptive patient read the book and judge for himself.

Instead of entering further into the medical details given by Dr. Carrick, we will now say a few words about koumiss itself. Koumiss has been prepared and employed by Central Asiatic nomads for very many centuries. But we will not be archaeological; we need only say that the early employers of koumiss made it in a vessel formed of smoked horse-hide, with the hair turned outward. Of late years wooden tubs have been substituted for the skin bags, and Dr. Carrick thinks that the koumiss churns of the future will be of glass. After the mares have been milked, their milk is whipped, and some fermenting substance is mixed with it. After a time the whole fluid begins to ferment, and in twelve hours "a not unpleasant koumiss is ready." When bottled, koumiss becomes effervescing to a very high degree; in fact, a bottle of koumiss, if uncorked, painfully reminds an inexperienced spectator of a mad animal foaming wildly at the mouth.

Dr. Carrick's book gives a full account both of the various methods of preparing koumiss and of the best means of preserving and employing it. We will therefore pass on to a consideration of its effects on the mind. We have already mentioned those which it produces on the body. As a general feeling of "coziness" affects the body, an analogous feeling pervades the mind. The "koumissniks" lie reclined upon the plains, regardless of mankind. No cares trouble them; at least so say the votaries of koumiss. Little do they reck of the tension of the Russian political atmosphere or the poverty of the present Russian poetical literature. Their condition is, in fact, very much the same as that of those lotus-eaters with whom we are so familiar. Far

away may be their former homes, a thousand leagues may separate them from all which used to be most dear to them; but they are in the flowery steppe, and all around them are hands ready to supply them with early koumiss. In peace and content their summer life passes tranquilly away. All that has been imagined of the happiness of consumers of opium, or bang, or hashish, or even gin, may, we are assured, be realized on the steppes of Samara by those adventurers who will go there in the summer and drink koumiss.

There is one point on which we would venture to differ from Dr. Carrick. We are inclined to think that he has been led into making an unnecessary attack upon one of the English substitutes for Russian koumiss. English koumiss, made from the milk of the cow and not of the mare, and therefore not possessing all the constituents which the Russian koumiss offers, can be procured at several places in London. We will not enter into a comparison between competing dairies. Dr. Carrick distinctly says that English koumiss made from the milk of the cow must not be compared for a moment with the Russian koumiss made from the milk of the mare; but he is of opinion that English koumiss is extremely valuable. He quarrels with the name koumiss, but it may surely pass muster. One of the Dairy Companies has rendered the name of koumiss familiar to many eyes by its perambulating carts, and it can be obtained from at least two other establishments. It is with Dr. Carrick's depreciatory remarks about the koumiss supplied by one of these establishments that we are inclined to disagree. So far as we are capable of judging, he seems to have found what we may perhaps be allowed to designate "a mares'-milk nest." But in every other respect we may cordially praise his book, which will perhaps in many cases prove as useful as it is certainly interesting.

#### THE TURN OF THE TIDE.\*

LADY MARGARET MAJENDIE, like Lady Georgiana Fullerton, whose *A Will and a Way* we lately noticed, goes to the first French Revolution for the scene of her story. In both tales the hero and the heroine belong to the class of nobles; but Lady Margaret Majendie is far more alive than her sister-novelist to the grievous wrongs under which the peasantry had so long suffered. Her sympathies are fairly distributed, and her wish clearly is to do justice to both parties. If she paints in strong colours the violence of the mob, no less does she set before her readers the insolence of the nobles, and the acts of oppression of men of the moneyed class. It is to be regretted that she, too, though not nearly so often as Lady Georgiana Fullerton, has fallen into errors which cannot readily be excused in the writer of an historical novel. Novelists are no more bound than the tellers of fairy-stories to confine themselves to any exact period. The old-fashioned and convenient beginning of "Once upon a time" is equally open to them. If, however, they venture on describing one of the most striking events in the world's history, it is not too much to ask that they shall first make a careful study of the times of which they treat, and next, shall spare no pains to keep clear of blunders. They must have their authorities at their elbow as they write, and must be willing to undertake a long search rather than let even a trifling mistake find its way into their narrative. It is often, indeed, some error in a matter of no very great importance in itself—a mere slip, as some would call it—that in a moment reveals an author's want of familiarity with the days which he describes with as much confidence as if he had himself lived in them. We are the more struck by the mistake, the more ambitious that the attempt has been to make the characters all in keeping with their age.

Thus Lady Margaret Majendie wishes to make her peasants speak like Breton peasants of the last century. She gets on pretty well for a time, but how great is the ignorance she displays when she makes a sailor in the year 1788 say that a fish "is at least three *kilos*," and a peasant-woman declare that it was worth "five francs fifty." Let her look to her books, and learn when it was that the new system of weights and money was introduced. The error into which she has fallen was one that could scarcely have been made by any one who had been in the habit of reading the literature of the eighteenth century. We can more easily forgive her when she makes the Assembly sentence the King to death, though to confuse that body with the Convention is a somewhat serious mistake. In a passage in the first volume where she describes the Constitution of Brittany, she is just a year out in her date, and writes 1789 for 1788. By Archbishop Loménie she means of course Archbishop Loménie de Brienne. The great storm that swept over so large a part of France in the summer of 1788 she places on June 13, instead of on July 13. To add to her blunder, she had made "the glorious harvest moon rise solemnly" a few days earlier. Our novelists are daring enough in their dealings with nature, but not many would venture, we believe, to place the harvest-moon early in June, even at a time of such general confusion as the French Revolution. A few days earlier, by the way, a fire of huge logs had been blazing in the open fireplace of a Breton farmer. We find in one passage an old woman crying out "For nights and days the cry, Bread! bread! rings in my ears. I have lived to see Fouquier die and Berthier." Has not our author here made a mistake and written Fouquier instead of Foulon? Foulon

\* *The Turn of the Tide*. A Novel. By Lady Margaret Majendie, Author of "Giannetto," "Fascination," &c. 2 vols. London: Richard Bentley & Son. 1881.

was Berthier's father-in-law, the man who said that the people might eat grass; while the only Fouquier whose name we call to mind was Fouquier-Tinville.

Many a novel, however, has made its way in spite of far more serious errors in history than any that we have mentioned. There are unfortunately errors in style in *The Turn of the Tide* which we should have thought would have almost overwhelmed it, did we not remember how little nice is the popular taste in such matters. The author has fallen into a mistake that is far too common in writers. She thinks that, because she lays the scene of her story in France, she must drag in scraps of bad French and bad English. She has no washerwomen in her narrative, but *laveuses*. The body of a woman who was drowned is "laid in the cimetière." A girl "arranges a large jardinière" (the error in the accent is scarce worthy of notice) "full of flowers." Some soldiers "charged the crowd with fixed baïonnettes." These French terms are in some parts very thickly strewn. Thus we read, "As they say that Mademoiselle Blanche is *vouée au blanc*, there will be much to do. The *buanderie* at Mont Marin is not so bad, but the *repasserie* is perfect." Six pages further on we come to such an absurd mixture of languages as the following:—"The hour was *passagère* to him, to Angèle it was supreme." That our author's study of French has not as yet carried her far into the niceties of grammar is shown by such phrases as "ma chéri," "eau sucré," "potage au choux," "aucunes lois contraire," "*vive* the States-General." To our taste, even these smatterings of bad French are not so offensive as the passages—far too frequent—in which she writes what no doubt she would look upon as a literal rendering of French idioms. Whatever merits the Hamiltonian system may have, for Heaven's sake let it be kept out of our stories! It is as far removed from light reading as a team of dray-horses is from light cavalry. On one page we come on such an odious piece of mongrel writing as "It goes without saying that we exact all our dues." Some rioters are spoken of as "these insolents"; while later on we read, "Would you believe it, Marquis, she has the pretension to rejoice in the approaching States-General, and to see in it the salvation of France?" We will do the author the justice to admit that she is, on the whole, fairly successful, when she deliberately sets herself to write English, in keeping clear of the extravagances of language which are at present the fashion. Nevertheless she has her fine passages. The following lines show what she can do when she tries. At the same time, as such descriptions do not abound in her story, they may also be taken as a proof of her self-restraint:—

The sky grew deep orange-yellow, over which lay long crimson clouds in straight level lines. Then anon it seemed as if a great body of clouds, black as night, rushed forward and ranged themselves round, forming what seemed a cave of liquid fire, overhung with black jagged edges, and from it a quivering river of gold poured over the restless sea.

Boom, boom fell the huge waves, making a fit rhythmic music to the grand scene that was being enacted before them.

The scene is soon brought to a close, for on the very next page "the fierce cavern of light" passes away, and "the dying sky-monarch" sets. If her language struts a little too much when she has to describe the clouds, she can paint the beauties of very humble objects indeed. She is writing of a night when a little garden was flooded with moonlight. "Every cabbage and onion," she says, "rejoiced in sparkling drops of dew." We greatly doubt whether cabbages have ever before found their way into the moonlight nights of poetical writers; but we feel sure that onions, at all events, are here for the first time thus honoured.

In spite, however, of the blemishes which we have pointed out, and of others which we pass over, the story, as a whole, is interesting. The plot is fairly well contrived, and some of the characters are well drawn. It is the earlier stage of the Revolution that is chiefly described, so that the horrors of the Reign of Terror happily fill but a very small space in the narrative. The hero and heroine go through a great many trials; but, so far as they are concerned, the conclusion is as happy as the times would allow. There is, to be sure, a second heroine, a girl of the peasant class, who makes but a sad end. But as she had taken, without any apparent cause, to have "strange unaccountable shivers," the reader is well prepared for her death. No less well prepared ought her relatives to have been, for they shivered also, and more than once, and not from cold. In fact, at the last but one of the shivers the old mother solemnly said "that moment a human soul left earth for Paradise." At the very time she said this her daughter was drowned. It is strange how our female novelists cling to all kinds of absurd superstitions. Let Lady Margaret Majendie study the bills of mortality, and see what a deal of shivering ought to go on in London alone for the human souls that every hour leave that one town. Man's life should be one unbroken ague-fit from the cradle to the grave. However, the story is kept pretty well clear of presentiments; and, as these chilly signs are not given till we are just upon the close, we have again reason to congratulate our author on her moderation. We shall hope to meet her again in a novel in which we shall find much more to praise than to blame. Her faults are, for the most part, such as can be easily avoided, and her merits, greatly as they are obscured in the volumes before us, are not inconsiderable. Let her not meddle with history, keep clear of superstition, avoid mongrel English, and not lard her sentences with French, whether good or bad, and she may give us a story that will win not only our attention, but our entire approbation.

#### GASCOIGNE'S LIBER VERITATUM.\*

THE reign of Henry VI. was until lately one of the darkest in the English annals. It lay between mediæval and modern history like the belt of forest that divided the townships of our earliest fathers—an impenetrable obscurity, accessible from neither side and only useful for the feeding of pigs. It was regarded, in fact, as a sty populous with the last ill-grown products of the middle ages, the social incurables who had lived beyond their time; and people were not eager to explore a territory at first view so uninviting. The student of the middle ages was unwilling to linger over their ignoble decay; and the student of the Renaissance did not care to look back into a time that seemed to give so little promise of the brilliant beginnings of modern history. Besides, the direct authorities for the study were few and meagre. It was not until means were discovered of supplementing these authorities—in other words, until it was seen that society was entering upon a stage in which the indirect evidence of contemporaries, such as that presented in their letters and journals, was to balance or even to outweigh the formal judgment of professed chroniclers—that attention was at length given to the period. The correspondence of the Paston family, edited long ago by Sir John Feun, served as an index to the scholars of the present generation, whose work, whether put forth magnificently "under the authority of the Master of the Rolls," or among the more convenient and not less scholarly productions of the Camden Society, or (let us add) by the private energy of Professor Arber, has thrown light in a peculiar degree on the age, which now takes its just prominence as immediately preceding and foreshadowing that which gave its mould to modern society. It is well to remember the extent and completeness of this laborious series of contributions to our historical knowledge of the period in question, in order to emphasize the distance at which it stands from the indolent performance now offered to us by Professor Thorold Rogers in the shape of a collection of all that is not directly theological in the *Liber Veritatum*, or Theological Dictionary, of Thomas Gascoigne. The custom has been for editors of such books to aim at combining the virtues of the textual critic with those of the historian. Mr. Rogers's ambition has been different; but it is to be regretted that the example of unscholarly editing should bear the sanction of the authorized press of the University of Oxford. It does not appear to whom we are indebted for the transcript of the book itself, but Mr. Rogers claims to "have regularly and carefully compared the copy with the original manuscript." He cannot therefore shift the responsibility of having produced one of the most ignorant editions of a mediæval work with which we have the misfortune to be acquainted. It is not merely careless (a word, for instance, is omitted in the very passage which he has given us as a means of correcting in the photographic facsimile prefixed to the book); it abounds in blunders of the most glaring kind, from which a rudimentary apprenticeship in reading manuscripts would have saved him. To those who are not skilled in this branch of palæography, or who have not an intuitive faculty of critical emendation, the book will present pitfalls and stumblingblocks at every step.

This is only part of our complaint against Mr. Rogers. If he has misconceived the duties of a textual editor, he has still more gravely mistaken the purpose of an introduction. In a lengthy essay of seventy-four pages he deludes the reader into imagining that every phase of English life, every side of English politics, will find some illustration in the book of Gascoigne:—

The reader [he says, p. lxxxix.] will find much more than I have commented on in these extracts. My object in writing this long introduction has been to give some account of the political and social condition of England in the first half of the fifteenth century, and particularly during the period which followed after the loss of the English possessions in France to the time of Gascoigne's death. The greater part of these notes were made, I believe, in the last eight years of Gascoigne's life. He lamented over the evils which had already come upon England, and he foresaw that greater evils were in store for her. To the modern student not the least of these was the wreck, for nearly two centuries, of public liberty in parliamentary institutions.

Such language comes very excellently from the mouth of the Liberal member for Southwark; but those who read his forty pages of strictly political, and in particular financial, history may lawfully expect to find something corresponding in the book itself. We have, however, only been able to discover four places which Gascoigne can by any possibility bring to justify Mr. Rogers's portentous display of economical knowledge; two are mere references to the Lombard merchants, and the other two are harmless stories of the manners and customs of the royal bailiffs. One of these is good enough for translation:—

In the time of Henry the Fifth, King of England, a certain king's bailiff, by name John Richworth, said to a fellow, "I have gained no profits to-day, but marry will I give a stoup of wine to thee or to another who will break the peace to-day in this town; because by that means I shall gain the profits." And the other, having taken oath that he would break the peace, received the wine from the bailiff, and, when he had drunken, immediately brake that bailiff's head with the sherd, saying, "I have done that for which thou didst engage me." And a great brawl arose among those in the town and in the castle; and in such wise did he who should have been guardian of the law engage a man to get the laws broken, in order that he might gain the profits from the breach of the law. This was done in the town of Pontefract in the county of York; and one who saw it bore witness to me in the year of the Lord 1448, in the manor of Hunslet, in the Diocese of York, in the which manor I was born" (p. 128).

\* *Loci a Libro Veritatum: Passages selected from Gascoigne's Theological Dictionary, illustrating the Condition of Church and State, 1403-1458. With an Introduction by James K. Thorold Rogers, M.P. Oxford: at the Clarendon Press. 1881.*

Little wider is the range of Gascoigne's political observation. Outside England and the Church, the sole event which seems to have impressed itself on his mind, besides the taking of Constantinople, was the check given to the Turkish advance by John Hunniades in 1456. Hunniades, Gibbon says, "shared the glory of the defence of Belgrade with Capistran, a Franciscan friar; and in their respective narratives, neither the saint nor the hero condescend to take notice of their rival's merit." It is interesting to notice that Gascoigne fairly apportioned the glory to both; but it is significant of his intense vanity that in the numerous references to the battle, "won," as old Fuller would say, "not by shooting but shouting," he seldom omits to add that he alone of the English Churchmen made it the motive of a solemn *Te Deum* and a sermon in the University Church.

To our knowledge of English history he contributes chiefly a few references to Henry VI.'s marriage, with its accompanying cession of Maine and Anjou, adding certain details which Mr. Rogers seems to consider valuable, but which are apparently mere gossip put together in a confused way. This marriage and its issues—among them the King's poverty, "so that he, the King of England, could scarce expend from his lands and holdings to the value of forty pounds"—are, in Gascoigne's mind, the prime causes of the secular troubles of the time. In connexion with them he touches upon the character and position of the Duke of Suffolk, of the Duke of York, and of Lord Say (who would allow no one to preach before the King unless he first saw the sermon, or else extracted an oath from the preacher not to attack the Government or the doings of the Privy Council, *prægi vel verius pravi concilii*). He discusses the insurrection of Jack Cade briefly, and gives an account of an agrarian outrage which would be more interesting if Mr. Rogers had been able to identify the case. Beyond these matters, most of them mentioned just incidentally, Gascoigne has only a few crimes and breaches or evasions of law to notice, and a few assaults on the fashions of the day.

We have been at the pains of searching through the book to find the basis of Mr. Rogers's introduction. The result is certainly very bare chaff in comparison with the Professor's grain. But, if we protest against the abuse of the position of editor to make his book a peg to hang whatever he may have to say on all subjects not more than half a century apart from it, we have nothing to say against the introduction considered as an essay by itself. It is not badly written, though obscure in parts, and a little discursive. It treats the fiscal history of the time in a manner worthy of Mr. Rogers's special knowledge and experience. But what we regret is that he should have thrown into the background what really makes the sole intrinsic interest of Gascoigne's book—namely, the corruptions of the English Church arising from non-residence of the clergy, the appropriation of benefices, the indolence of the bishops, and the aggressive interference of the Roman Court in the ecclesiastical affairs and finances of the country. On these matters Gascoigne is very energetic and eloquent. His testimony, if that of a partisan, is not the less independent and striking. He has also many portraits of prominent Churchmen of his time. One of these is used as a constant illustration, serving almost every separate development of wrongdoing on which Gascoigne comments. His typical miscreant is Reginald Pecock, Bishop of Chichester, one of whose works, the *Repressor of overmuch Blaming of the Clergy*, was printed by the Rev. Churchill Babington in 1860. Mr. Rogers would have done well to have looked into this edition more carefully than he has done. He might, for instance, have found in it, as well as in Mr. Davies's *Chronicle of England to 1471* (published in 1856 by the Camden Society), a correction of the lines which Gascoigne's manuscript gives as "Wyt hath wundur that reson kan not tel; how a moder is mayd and God is man"; but which obviously must read "Wyt hath wundur that reson not tel kan," &c. Mr. Babington has also made a thorough study of Bishop Pecock's theological position, which ought to have been used as a check upon the vehemence of Gascoigne's rancour. But Mr. Rogers does not appear to have consulted any special book on the questions which his author writes about.

Besides his views on Church matters, Gascoigne has a great deal to say with regard to the University in which he often held the post of Chancellor. Indeed, it is from the extracts from the *Liber Veritatum* in Anthony a Wood that Gascoigne's name has been chiefly known. We may observe in conclusion that it is especially desirable that an index (like an introduction) should have some relation to the book itself. This is a demand which, in at least one notable instance, the present table, which has several false references, and is generally chaotic, does not fulfil.

#### TWO MINOR NOVELS.\*

WHEN we say that *Uncle Z.* is a romance of the Black Forest it will be presumed that the fancy has free play in it. For the Black Forest has from time immemorial been the classic ground of legend and supernatural story; and if we remember aright, the meetings of mortals with beings of the spirit world in the dark ages are to be seen commemorated in the frescoes on the Trink-Halle of Baden-Baden. There is scarcely a stream or spring

of special loveliness but has its well-authenticated tradition; the restless spectres of former tenants haunt the roofless halls of each ruined Schloss; and there is hardly a picturesque defile but is shunned by the peasant when darkness is drawing on, at certain uncanny seasons. These ghostly apparitions used to be as generally accepted as any article of the peasant's creed, although it is possible, indeed, that they have lost their hold upon him of late years with the spread of education and Radical ideas. But the events detailed in *Uncle Z.* happened nearly sixty years ago, when the imagination still yielded implicit faith to the well-confirmed authority of tradition. The legend of St. Boniface's spring is a very natural and pretty one, and might have commended itself easily to a simple-minded people; the rather that, when once it had been received in the country, men were little likely to put its truthfulness to the test. But the art of Mr. Phillimore's clever story consists in his making a chance visitor and an Englishman a convert to the popular belief without shocking too severely the critical intelligence of sceptical readers. Truly it does not seem likely at first sight that in the early part of this nineteenth century a young traveller should find running water shrink from his lips because he cherished hatred and malice in the depths of his heart. He was startled at the phenomenon, and so are we; yet we are made to feel, taking into account the circumstances and surroundings, that there may be more things in heaven and earth than are dreamed of in our philosophy. We are inclined to admit, with the hero of the tale, that the intermittent flow of the sensitive spring is an undeniable fact, which we may explain as we will; for by his descriptions of the scenery and the natives of the Forest the author has been steadily working us up into a congenial frame of mind. And we trust the more to the impressions of the narrator, we are the more assured that he was the victim of no delusion, because the beginning of the tale is practical enough, and in healthy contrast with its mysterious development. Carried back, as we have said, for nearly sixty years, we have charming sketches in outline of the successive stages of the journey, with the various modes of conveyance he adopted. Changing from diligence to post-chaise, from post-chaise to saddle-horse, we have him joggling quietly forward, from the French shore of the Channel to the approach to the interior of the Schwarzwald, through the Höllethal. He describes the venerable Rhenish cities as they were, before they were awakened from a life in death by the rush of legions of tourists. Observing and moralizing from the past to the present, he wanders along the banks of the Rhine and under the shadow of the wooded Bergstrasse to Freiburg. Thence, on the way to the sylvan Schloss of the somewhat eccentric relative he goes to visit, there is a series of striking pictures of the scenery, the people, and their picturesque dwellings. Stranger as he is, these pictures are made to appear the more lifelike because he beguiles the slow stages of the road in friendly intercourse with the servants that his uncle has sent to escort him. Nor is the long ride without dramatic incident; as on one occasion when he passes the night of a violent thunderstorm under the roof of what is half a farmhouse and half an inn. While the lurid glare of the flashes is lighting up the dark forest, and the woods with the crashing of breaking boughs are echoing to the long peals of the thunder, he listens to the wild tales which are being circulated in an awe-struck company who are sheltering from the tempest. He listens with the greater interest because he is already in unfriendly relations with a singular character who takes a leading part in the conversation. Impulsive and romantically inclined, his prejudice against Ulric, the travelling clockmaker of Freiburg, had arisen out of what was really a trivial incident. And it must be granted that the clockmaker, who was morose and ill-conditioned enough, was in a great measure to blame for the misunderstanding. The Englishman had run up against him accidentally in the town of Düsseldorf, when the man was carrying an ingenious piece of mechanism. Thenceforward, the two detested each other; and it was unlucky that chance or fatality should be perpetually throwing them together. When the one takes his seat in a Rhine diligence, the other mounts on the roof. When the one is admiring a church, the other is at work in the clock-tower. Now the pair have met again in this lonely *Gasthaus* in the forest; and the next day, when the Englishman is threading the glades of the pine woods on horseback, the grand scenery is spoiled to him by the figure of his *bête noire*, who is clambering the hills in advance and cutting off corners by the footpaths. It seems something more than a coincidence when he discovers that this Ulric is the special protégé of his Uncle Z., and that he inhabits a cottage in a clearing in the immediate neighbourhood of the castle. The young man inwardly resents more and more this enforced contact with the object of his aversion. And it must be owing to that aversion that he has sought in vain to quench his thirst at the waters of the enchanted spring. The tacit reproach of his unchristian frame of mind does not tend to diminish his hatred. It seems likely that he is to leave these peaceful scenes a worse man than he was, and that he must carry away the reproach of an uneasy conscience. Nevertheless, his very uneasiness shows an inclination to a better state of things, and Providence sends him the opportunity of being reconciled to his enemy. By a generous impulse, and at the hazard of his life, he rescues the pet child of the clockmaker from a situation of extreme peril. Then the implacable Ulric, whose nature in many respects resembles his, goes at once to the opposite extreme, and overpowers the saviour of his child with his fervent gratitude. The brave stranger receives unstinted admiration and praise from the simple inhabitants of the forest-village, and we need not say that before leaving the district he makes a

\* *Uncle Z.* By Groville Phillimore, Rector of Henley-on-Thames. Edinburgh and London: William Blackwood & Sons. 1881.

† *Parity Unwin.* By Sydney Warrington. London: Remington & Co. 1882.

point of satisfying himself, by a visible sign, that the beatified Boniface has made peace with him like Ulric. As for Uncle Z, though naturally made prominent, he really plays a secondary part in the story. But the character of the benevolent aristocrat of the old school is depicted gracefully and vigorously. He lives simply, though hospitably, that he may have the more to spare for his works of charity. The Providence of his neighbourhood, though never forgetting his position, he is the friend and counsellor of his humble neighbours; though unaffected in his religion, it belongs to the custom of the country that he should kneel openly at his devotions before the wayside crosses; and we can easily understand the influence he establishes over the nephew, whose character has been elevated in our eyes by Uncle Z's reluctance to part from him.

The dénouement of *Purity Unwin* chances to be almost contemporaneous with the visit to the Black Forest which is described in *Uncle Z*. The story is a fanciful one; but it is possible, if not probable, and the interest is well sustained throughout. The improbability lies not so much in the plot and its leading incident as in the characters of the two ladies principally concerned, whose wishes or fancies prompt them to a misdeed of which we should have been loth to believe them capable. There is an hereditary connexion between the families inhabiting Summerwood Hall and Summerwood Farm. They are descended from the same stock, and so the noble Earl of Summerwood is of no better blood than the hard-working farmer his neighbour. Indeed the peer is the head of the junior branch, and is indebted for the possession of his ample estates to the generosity of the farmer's ancestors. So that the close connexion between the titled and the agricultural Unwins is not so unnatural as it might otherwise have been. In the beginning of the century each branch had a daughter, and each daughter bore the family name of Clara. Both girls were gifted with good looks; but Lady Clara Summerwood, who inherits the estates on the Earl's death, was brilliant and beautiful. She was impulsive, emotional, and wayward, too; while "Clary," as the daughter of the farm was styled by way of distinction, was far more self-contained. Yet, according to our presentiments, notwithstanding her better-regulated mind, Clary was decidedly less prepossessing. That is not the opinion of the cousin, who marries and loves her devotedly, though more than suspecting that he is not loved in return. As for Lady Clara, with all her exaggerated pride of birth, she had insisted on making a marriage of affection, much against the will of her parents. And her husband had given her his hand out of sheer delicacy of feeling, when she had betrayed to him an affection which he did not reciprocate. Once wedded, she is morbidly watchful of him. She believes, unreasonably as it proves, that she is losing hold on his heart, because she has not given him the son he desires. When she discovers herself to be *enceinte*, her anxiety only increases. Her morbid fancy has assured her beforehand that the child will be a girl, and in that assurance she addresses herself to her friend Clary, who chances to be in a similar condition. Clary yields partly to friendship, but more to ambition; and it is arranged that, should Lady Clara's presentiments prove true, the boy and girl shall be exchanged at their birth. The woman who attends her is taken into their confidence, and the exchange is supposed to be effected accordingly. Jeffrey grows up an attractive youth, taking after his mother in the ardour of his nature; while Purity at the age of seventeen is a simple and beautiful maiden. Meeting after a long separation, of course the youth and maiden fall in love. Probably, in the circumstances, they would have been permitted to marry, and so the affair would have arranged itself quietly. But Jeffrey insults the old village contidante, who revenges herself by unfolding to him the story of the exchange. Then we have a succession of thrilling scenes of anger, remorse, embarrassments, explanations with the injured husbands, tears, fainting fits, penitence, and forgiveness; when, at the culminating point, and to our surprise, as we confess, the author has compassion on the feelings of the fathers who have become bound up in children who were none of their own. The old contidante has lied maliciously; the exchange, in reality, had never taken place, since, in fact, there had been no occasion for it. The Lady Clara had given birth to a boy; but her friend Clary had encouraged a deceit, for reasons which certainly seem rather farfetched. She knew that, if Lady Clara "imagined Purity to be her daughter, there were no heights to which the girl could not aspire—probably to marry the heir." And as the girl does marry the rightful heir, with every prospect of a happy and prosperous future, her offence is far from having its appropriate punishment; nor do the innocent children pay the penalty of the faults of their mothers.

#### GERMAN LITERATURE.

THE alarming progress of Socialism in Germany would seem to be more and more directing the attention of German economists towards England as a country where Communism has never taken root, and where the relations of capital and labour, uneasy as they frequently may be, are as yet adjusted upon the basis of individual contract. The late Professor Held (1) had intended to be the historian of the influences which for the last hundred

years have been steadily elevating the status of the English working classes in such a manner as to impede the dissemination of Socialistic ideas among them. A lamentable accident terminated his life when the first volume only was ready for the press. Enough, nevertheless, remains to make a creditable beginning, and to show that the completion of the book would be a useful and honourable undertaking for a competent hand. The period embraced in this volume extends to 1832, when the Reform Bill had laid the foundation for subsequent legislation in the interests of labour. It is, therefore, to a great extent merely introductory. It is prefaced by a careful and exhaustive survey of the political and economical literature of the half-century preceding the Reform Bill. Bentham, Cobbett, and Owen are treated with especial fulness, and the writer concludes that it has been the salvation of England that the ideas represented by the last two names never coalesced; but that political agitation in this country has always been devoid of a Socialistic tinge, and *vice versa*. It may be inferred that Herr Held would have approved the principle of Prince Bismarck's recent efforts to detach Socialism from social democracy, inclined as he would probably have been to criticize the means employed. The remainder of the book is chiefly occupied with a sketch of the development of commerce and industry, of the decay of the old guilds and other restraints upon unlimited competition, and of that predominance of the manufacturing interest which has created the problems whose solution the author had intended to describe.

A summary of the history of Europe since the fall of Napoleon, by the late Arnold Ruge (2), is of course written from the point of view of extreme Liberalism, and in many respects rather resembles a pamphlet than a history. It is nevertheless spirited, fair in intention, and commendably brief.

Dr. Wieseler's investigation of the history and religion of the ancient Germans (3) displays much erudition, but hardly an equal amount of judgment. He will find it difficult to convince philologists that the Germans are to be identified with the Cymry, or even with the Parthians.

Dr. Dühring (4) occupies a position in some respects analogous to that of Schopenhauer, but much more disadvantageous. Schopenhauer possessed an independent fortune, and could abuse the *Zunft* or "ring" of professors who stood between him and the public to his heart's content without fear of disastrous consequences; but, if poor Dr. Dühring enjoys the same immunity, it is only because the *Zunft* has by this time left him nothing to lose. He has been deprived of his professorship, has been unable to bring himself to co-operate with any party, political or philosophical, and stands alone in Germany, an intellectual Ishmael. The story of his persecutions is recounted by himself in a volume of unusually terse and racy German, with an appendix serving as a kind of confession of faith. It seems clear on his own showing that he is much too pugnacious and angular a man to fit into any recognized hierarchy, and the more we admire his rugged independence, the less surprise we feel at the inability of his colleagues to work with him, and the less disposed to attribute their treatment of him to the mean motives to which he himself not unnaturally ascribes it. The official world and he are not made for each other, and the sooner he recognizes the fact and devotes himself to authorship pure and simple, eschewing all personal controversy, the better it will be for him and his country, which cannot afford to spare a man of his originality and integrity. Such a man should have something better to do than venting illiberal abuse of professors and Jews, and proving how thoroughly he is himself penetrated by Goethe's maxim, "Nur die Lumpen sind beschleiden."

It is generally known that the indefatigable Dr. Schliemann employed last winter in an exploration of the Boeotian Orchomenus (5), the capital of the wealthy King Minyas, the first of men, according to Pausanias, who built a treasure-house. A thin volume records the results of his exploration—interesting, but less fruitful than he probably hoped. The site of Minyas's treasury was well known, and had already been twice attacked—first by Lord Elgin, who began at the most impracticable point, and soon desisted; and more recently by a Vandalic magistrate, who wanted to make the ruins a quarry for a new church, but was stopped by the Minister of Public Instruction. Dr. Schliemann has succeeded in completely laying bare the ground-plan of the ancient building; but his only actual discovery of much archaeological importance is the elegant ceiling of the "thalamos," or recessed chamber opening out of the treasury, exhibiting a rosetted pattern otherwise unknown in ancient Hellenic art, and manifesting Assyrian affinities. It is figured in his work. Shortly after the completion of his Boeotian explorations Dr. Schliemann betook himself once more to the Troad (6), and ranged over it in quest of any traces of ancient remains other than those he had himself brought to light at Hisarlik. His conclusion is that no prehis-

toric remains can exist, except at a place called Kurschunlu Tepeli; and that the only prospect of any finds of the classical period is held out at Assos, Antandros, and the Alexandrian Trons, a city whose walls were six English miles in circuit. The thinness of the superincumbent stratum of rubbish at all these places is in striking contrast with its amazing depth at Hissarlik. Dr. Schliemann's tour is very agreeably described, and is in itself a sufficient proof of the genuineness of his Homeric enthusiasm.

Professor Kiene's essay upon the Iliad and Odyssey (7) is a rare, but welcome, phenomenon in German criticism, stoutly maintaining, not only the artistic unity of the epics, but their common authorship. Professor Kiene justly observes that mere philological attainments do not of themselves qualify a critic to dissect a poet, and that Goethe's dictum as to the advantage of studying a poet in his own country is as applicable to Homer as to other bards. The essay concludes with some pertinent remarks on the bad effect of merely negative criticism in education.

The Epistle to Diognetus, hitherto commonly attributed to Justin Martyr, is likely to afford a bone of critical contention for a long time to come. While declining to attribute it to Justin, Dr. Dräseke (8), the most recent inquirer, contends against the hypothesis of Donaldson and Overbeck, by which it is regarded as a fabrication later than the time of Constantine. There seems no adequate motive for such an aimless *supercherie* as a defence of Christianity after its definitive victory; while the inherent probability of Dr. Dräseke's view, that it actually is what it professes itself, can only be shaken by strong internal evidence, which is apparently not forthcoming. Dr. Dräseke ascribes it to nearly the same period as the apology of Athenagoras, about 177 A.D., and strengthens his position by the remarkable verbal analogies he discovers between the epistle and the writings of Tertullian, which certainly seem too decided to be the result of accident. An excursus on the life and writings of Gregory of Neocæsarea is appended, which contributes some interesting data for the biography of Origen.

"The Social Policy of the Church," by J. Albertus (9), puts forward pretensions to be a philosophical history, but resolves itself into a dull and tedious polemic against Protestantism and the arrangements of modern society, including religious toleration and constitutional government.

Dr. T. Kolde's sketch of Frederick the Wise, Elector of Saxony (10), Luther's patron, is slight but interesting, and enriched with several unpublished documents.

Rubens (11) is not only a great artist, but one of the few great artists who have mingled on equal terms with the great world, and performed in it a part not unworthy of their eminence in their own peculiar province. Alike as court-painter and diplomatist, he was brought into frequent connexion with illustrious personages, and his letters to them—courtesy without insincerity, and deferential without servility—seem, brief as they generally are, to reflect the stately and liberal spirit manifested in his paintings. They thus possess a considerable interest independent of their actual contents, and this interest is enhanced by the seasonable, though sparing, annotations of their latest editor, Herr Rosenberg, who has succeeded in adding about a fifth to the collection already accessible to the public. Some of those, indeed, only exist in translations, while of a few, written in a difficult cipher, abstracts only have as yet been made. The language is most commonly Italian. Herr Rosenberg is under great obligations to our countryman Mr. Sainsbury; but one special feature of his collection is the publication for the first time of Rubens's letters preserved in the Mantuan archives in the original text, they having hitherto been printed merely in extracts, or in the French version of M. Baschet.

Dr. F. Landmann (12) has made a really important contribution to the critical study of Elizabethan literature by an essay on Euphuism, which he has defined with more precision than heretofore, and traced to its source in a foreign literature. The essence of Euphuism does not, as often assumed, consist in the affectation of phraseology; many of its coryphæi, Lyly's predecessors, were worse offenders in this respect than Lyly himself. Nor is its distinctive characteristic hyperbolic conceit and obscurity, as subsequently with Gongora and Marini; but, on the contrary, definite antithesis, wrought out with elaborate monotony. Lyly was, nevertheless, no contemptible writer, and professedly adapted his compositions to the taste of the Court. His model, as Dr. Landmann seems almost to demonstrate, was "The Dial of Princes," by Bishop Antonio de Guevara, of which "Euphuus" is frequently a mere imitation, and sometimes a mere copy. Some of the Spanish ecclesiastic stories had already been translated in Pettio's "Palace of Pleasure," published two years before "Euphuus," and these, in their English dress, might almost pass for the production of Lyly himself.

Herr Adolf Palm's sketch of the history of the Stuttgart Theatre (13) is both a valuable and an entertaining contribution to the history of the stage in Germany. The annals of the theatres at the minor capitals of Germany are more eventful than those of the principal theatres of most other countries, on account of the Court patronage they enjoy, and the emulation which has led German princes to vie with each other in the ostentatious encouragement of the stage. The Stuttgart Theatre has had its fair share of patronage, and many interesting episodes of its history are brought together by Herr Palm, whose work assumes the form of a series of letters to a lady friend. The chief laurels of the Stuttgart Theatre seem to have been earned in connexion with the lyrical drama; nevertheless, Herr Palm complains that its repertory is singularly limited; and his agreeable little book concludes with the inquiry why, after all, Stuttgart should still be an unmusical city?

The *Shakespeare-Museum* appears to have been a periodical, edited by Herr Max Moltke in 1870, which is now reissued in a volume (14). The contents are partly original communications respecting Shakespeare, partly a selection of remarks from various authors, especially German, on the inexhaustible subject of his works. They are, for the most part, very well chosen; and it may fairly be said that the collection will, in general, interest readers in proportion to their interest in Shakespeare. The best of all the contributions is a lecture, delivered at Weimar in 1847, in the German language, but evidently by an Englishman, in which the notion that the Germans discovered Shakespeare is effectively disposed of, and the defects of Schlegel and Tieck's translation are smartly, but good-naturedly, exposed.

Herr Moltke has also performed a useful service to Shakespearean students (15) by bringing together the materials out of which Shakespeare constructed *Hamlet*—Saxo Grammaticus in Latin and German, Belleforest's story of "Amleth" in his *Histoires Tragiques*, and the old English version which Shakespeare probably read—together with an introduction and notes by the late Dr. Geierke.

*Amtmann's Magd* (16) is less interesting than most of E. Marlitt's novels. It is pretty and well written, but rather feeble.

The selection of tales from the Danish, Swedish, and Norwegian, translated by W. Lange (17), comprises nine novelettes by Kielland, with other stories by Jonas Lie and other writers of repute, and forms altogether as pleasing an introduction to popular Scandinavian fiction as those unacquainted with the language could desire. Hermann Lingg's "Byzantine Novels" (18) leave something to be desired as stories, but are pervaded by a poetical sympathy with the barbaric magnificence and gorgeous decay of the Byzantine period which endows them with genuine vitality.

The most interesting contribution to a not very interesting number of the *Rundschau* (19) is a story, "Bridget of Trogen," by C. F. Moyer, the scene of which is laid at the Council of Constance, and which is supposed to be narrated to Cosmo de' Medici by Poggio Bracciolini. It is worthy of the time and place, vividly reflecting the spirit of the Renaissance. Karl Hillebrand's summary of the recently published biography and correspondence of Sir Anthony Panizzi is neatly executed, but contains nothing new; nor is there much originality in a well-written essay on the Laocoon group. A "communicated" article on "Kulturkampf," if really proceeding, as stated, from an exalted Catholic personage, displays more moderation than one usually expects from such quarters.

There is a decided tendency in our day for men of letters to become editors of magazines. The eminent novelist Sacher-Masoch, hitherto regarded somewhat in the light of a literary guerilla or free lance, now appears as a regular captain at the head of a very respectable body of recruits. The principal claim of his magazine, *Auf der Höhe* (20), to especial attention consists in its cosmopolitan character, and particularly in the strength of the Austro-Slavonic and Magyar elements, hitherto but imperfectly represented in the periodical literature of Western Europe. Its weak point, in the first number at least, is oblivion of Faust's dictum, "Name ist Schall und Rauch," the substantial importance of the contributions of Vogt, Bluntchli, and Mme. Adolphe Adam scarcely corresponding to the celebrity of the writers. Ample amends, however, are made by the editor's own novelette, *Der Judenraphael*, open to the charge of improbability as respects some of the incidents, but sparkling in style, and full of pungent humour.

## GERMANY.

THE German Parliament has at length been finally constituted, and its composition can now be definitely ascertained. The total number of Conservatives and Clericals is 187, and that of the Liberals is 153. The remaining 57 members belong to small separate groups, of which the Social Democrats with 13 representatives, the Poles with 17, and the Alsace-Lorrainers with 13, are the chief. The chief losers in the contest have been those Conservatives who belong to the more Liberal section of their party, while the chief gainers have been the Progressists who belong to the more advanced section of the Liberal party. If the National Liberals who retain the old party shade, and those who are called Secessionists because they have split off from the National Liberals, chiefly on the question of Free-trade, are reckoned together, the total number in this Parliament is almost exactly the same as in the former Parliament. But, as more than forty National Liberals have thought it worth while to proclaim themselves Secessionists, the shade of Liberalism in the party generally is decidedly more pronounced than it was. And it may be said generally that the whole character of the new Parliament is that of a Parliament in which every shade of opinion has become accentuated. The Conservatives who have survived are those who are most devoted to Prince BISMARCK. The Liberals are not only more numerous, but more decidedly Liberal. The Social Democrats are reinforced by five new representatives. Those who are Poles before everything have gained an accession of strength. All the Alsace-Lorrainers are returned either as Ultramontanes or as Protestants; and there is now a little band of Guelphs, as they are called, who have faith in the special doctrine that the harsh treatment of Hanover by Prussia ought to be stopped. It may be remarked that exactly the same thing is happening at the same time in Austria. There the various groups of the German party in the Parliament have agreed to forget their differences, and to form a United Left; while the Clericals have parted from the Ministerialists, and refuse to help the Ministry until they can get something substantial out of it. The very useful map of German representation published in the *Times* shows what is the local distribution of opinion in the Empire, and the results, if not unexpected, are well deserving of attention. The strength of the Conservatives lies in the old provinces of Prussia, that of the Clericals in the Rhine provinces and the South, that of the Liberals in the large towns and in the small Protestant States. Every member for Berlin is a Progressist; Hamburg returns two Liberals and a Democrat, and Bremen and Lübeck both return a Liberal. Of the Liberals, far the greater number are members of the learned professions, and naturally most of the Conservatives and many of the Clericals belong to the landed gentry. This is inevitable in a country like Germany. There are no other classes whom the electors, if they wish to return men not utterly unknown, can elect. The present Parliament may not be all that could be wished; but there is no reason to suppose it is not as good a Parliament as Germany in its present stage of political history could produce.

The EMPEROR was not well enough to read his Address to the Parliament on its assembling, and it was therefore read for him by Prince BISMARCK. The most remarkable

feature of the speech was the prominence given in it to the feelings and wishes of the EMPEROR himself. All the favourite measures of Prince BISMARCK appeared as the favourite measures of the Sovereign. It was the aged WILLIAM who longed before he died to see the great work of his life completely carried out. It was he who had a last sacred duty to discharge, and who appealed to members of all parties to help him to carry it out. His grey hairs could not go down to the grave in peace until he could take with him to the tomb the soothing knowledge that arrangements had been made for the Imperial and provincial Parliaments not sitting at the same time, that there was to be a system of State insurance, that provision was to be made for the sick and aged, and that a tobacco monopoly and increased duties on beer and spirits were to replace direct taxation. There is something at once comic and pathetic in this mournful declaration of a Sovereign very old and very much revered that he cannot die happy unless he lives to see the introduction of a new machinery for selling the humble cigars in which his subjects take such an innocent and inexplicable delight. There can be no doubt, however, that the EMPEROR, whether unassisted or under the persuasion of Prince BISMARCK, has worked himself into the belief that all the measures to which he referred are very precious to him, and ought to seem very precious to Germany. He knows the loyalty and affection which the mass of his subjects bear to him, and he may have honestly thought that, if he touched the right chord, all resistance would disappear. But it is very doubtful whether his intervention will have any effect. The Parliament knows perfectly well that the measures proposed are really the measures of Prince BISMARCK, and the Opposition at once set down the appeal of the EMPEROR as a new manoeuvre of Prince BISMARCK. And then, as each measure comes to be discussed, it must be discussed on its merits. There are plausible arguments for a tobacco monopoly and plausible arguments against it; and, when they come to be set one against another, it must seem to the disputants somewhat irrelevant to be reminded that a man, old in years and honour, but whom the monopoly cannot possibly affect, fancies he should like to see this monopoly established before he dies. An appeal by the EMPEROR to the country on any question affecting the honour or European interests of Germany would have had a very great effect; but the periods at which Parliament should sit and the mode in which tobacco should be sold are matters too prosaic and too minute for any appeal to their tenderer and nobler emotions to guide members in their practical decision.

The notion that Prince BISMARCK ought not to have announced his intention of proposing measures which it was doubtful whether he could carry may be English, but it is certainly not German. Prince BISMARCK is a servant of the Crown, not a Parliamentary leader; and he submits to the legislative body the measures which the Crown permits him to submit, and then the legislative body chooses whether it will accept them or not. He is as sure as he ever was that all his favourite measures are good, and he places them before the new Parliament as he placed them before the old. If he does not carry all, he may carry some; and those that he does not carry one Session he may carry another. It is not by any means improbable that he may carry some of his measures in the next few months. When the first vote of the Session was taken, the Government carried its nominees for the Presidency

and for both the Vice-Presidencies of the Parliament. So long as the Clericals work with him he has a majority against the Liberals, and he can only be beaten by a coalition of Liberals and outsiders; but the outsiders are more likely to go with him than against him. When he is trying to please the Socialists, he will have the Socialists with him, and most of the Clerical outsiders; and all the Poles, and many of the Alsace-Lorrainers, are Catholics. Then it must be borne in mind that most of the objections to Prince BISMARCK'S measures are not objections to the measures themselves, but to something that is supposed to be involved in the proposals. No one can possibly deny that it is most inconvenient that the German Parliament should sit at the same time as the Prussian; but those who take pride in the German Parliament fear lest, if it did not insist on sitting every year, it might be eclipsed by the equal prominence given to the Prussian Parliament. The last Parliament did not object to the principle of State insurance; but it wished that each State should undertake the business for itself, and not that one central body should do the whole of the work. In the same way, the reluctance felt to allow the introduction of a tobacco monopoly is not an objection to the particular mode of raising a revenue so much as an objection to a vast extension of the central bureaucracy. Prince BISMARCK has come to think, whether rightly or wrongly, that the true secret of keeping the Empire together is to centralize as much as possible, and his great difficulty is to get a Parliament, the majority of which is opposed to centralization, to pass his measures. He can only obtain a majority by manœuvring; but he has good reason for thinking that his power of manœuvring is considerable. He knows that most of the Clericals are opposed to centralization; but he calculates that they will let things pass that they do not much like if they get concessions made to them on religious matters as to which they feel a burning and immediate interest, and they are supposed to look with great favour on the proposal for restoring Guilds over which the Church might exercise a secret, but very powerful, influence. If he can get the Clericals with him, he can also probably get many of the outsiders; and thus, even in the present Parliament, he may win successes that will go some way to compensate him for his electoral defeats. The gain to Germany of the recent elections is, not that Prince BISMARCK will be prevented entirely from getting his way, but that he will be exposed to a greater amount of independent criticism than he has hitherto received, and that the country is now conscious of possessing a considerable number of men who have had the courage to resent the bullying and the arrogance of the Ministerial party.

#### THE STAFFORD ELECTION.

THE importance of the Stafford election is not inconsiderable, though it may have been exaggerated by the organs of the winning party. The result may be set off against the Ministerial triumph at Berwick, leaving the Opposition a large balance of recent elections in their favour. It is true that some of the successes of Conservative candidates were attended by unsatisfactory circumstances. One or two of them had imitated the conduct of their adversaries at the general election by tampering with the Irish vote; and it seems possible that in some places they may have profited by the passing delusion of the form of Protection which was called Fair-trade. On the other hand, a counter-deduction ought to be made from the alleged drawbacks on account of the uncertainty of the Irish vote, and the doubt which exists whether the farmers of North Lincolnshire and Cambridgeshire really thought a revival of the Corn-laws either possible or desirable. The excuses by which a losing party consoles itself for defeat would be more effective if they were not always forthcoming. When by-elections one after another turn against the Government, it may be probably inferred that its policy is becoming unpopular. The return of Mr. SALT for Stafford is so far satisfactory that it cannot be explained away. It is possible, though not certain, that the Irish voters obeyed the orders of the Land League as faithfully as when, a year and a half ago, Mr. PARNELL was the active supporter of Mr. GLADSTONE; but it seems that there are in Stafford only a few Irish voters, and the contest was decided by the genuine constituency. Mr. SALT, who is

an intelligent and well-informed politician with some official experience, talked no nonsense about Fair-trade. His position and character undoubtedly gave him local influence; but modern Liberalism incurs a check as often as constituents take personal claims into consideration. The managers of the party are best satisfied when their nominee relies exclusively on the recommendation of some club or committee, backed by an inevitable certificate from Mr. GLADSTONE.

The losers are estopped from the pretext that their defeat was caused by the unpopularity or other demerits of their candidate. They had the choice of several applicants for the vacant seat, and the majority of the managers thought that their best chance lay in the choice of an extreme partisan belonging to the variety which is known as a working-man. Mr. GEORGE HOWELL is, in fact, a journalist; but he judiciously continues to describe himself by the employment which he formerly pursued. The late member, Mr. MACDONALD, had recommended himself to the choice of the Stafford electors by a similar career, except that he had accumulated a property which is said to have been considerable. As a Trades-Union delegate he was accused of causing enormous mischief, both to his clients and to their employers, by promoting unnecessary strikes; but operatives seem always to prefer the leaders who represent their passions rather than their interests. The Stafford Liberals had plausible grounds for thinking that their cause would be served by the choice of a candidate who had once been an outsider. They had some hesitation in re-electing their nominee; but, having made up their minds, they supported Mr. HOWELL with laudable zeal and unanimity. One of the Government Whips was detailed to assist in the canvass; and Mr. GLADSTONE, as a matter of course, wrote to approve their choice, and to stimulate their exertions. He wanted, as he declared, more working-class members in the House of Commons, and he considered Mr. HOWELL an excellent representative of the class. It is probable that comparative humility of social status may tend to insure that implicit obedience to the PRIME MINISTER which has become the most indispensable quality of his supporters; but any other Liberal candidate might have counted on receiving a testimonial from Mr. GLADSTONE. It is not clear that these familiar documents have any effect on electoral contests; but, in case of failure, they involve the disadvantage of involving the great chief of the party in a provincial defeat.

There is perhaps a certain absurdity in the importance which is attached to the opinions and votes of the small tradesmen and workmen who form the bulk of the constituency in a third-rate borough; but, if the electors of Stafford really disapprove the policy of the Government, they perhaps represent the present tendency of popular judgment. It seems improbable that the artisans of Stafford should sympathize strongly with the plundered Irish landlords, and yet they may share the natural disgust of Englishmen at a shameless perversion of justice. It is at least certain that they are not now inspired with the enthusiasm which Mr. GLADSTONE had contrived to elicit by his unscrupulous declamations on the eve of the general election. Some of them may perhaps have resented the sacrifice of national honour in the Transvaal; but, on the whole, it seems probable that, in the absence of strong political excitement, they preferred a respected and capable neighbour to a professional agitator from London. The credit of the borough for purity seems of late years to have been re-established. Lord CAMPBELL, who more than once contested it, with the result of becoming its representative, candidly avows his disgust at the open purchase of votes in which he found himself compelled to engage. In those happy times some of the electors came to the polling-booths with five-pound notes stuck in their hats. In the course of forty or fifty years fashions change, sometimes for the better. The Stafford election may not improbably serve as a precedent for additional Conservative victories. Constituencies, like single persons, incline to the winning side. It is highly desirable to diminish the great majority which has not yet been seriously impaired. A despotic and reckless Minister becomes more cautious when it is doubtful whether he continues to represent popular opinion. Mr. GLADSTONE will not make the mistake, as in 1874, of precipitating a dissolution because he may have lost a few occasional elections; though it is not improbable that a series of local defeats may accelerate the production of the

threatened Reform Bill. It will be an obvious remedy for remedying to enfranchise new voters that they may redress the balance of the old. The counties, under a system of household suffrage, may perhaps supply the deficiencies of the boroughs.

No idler taunt has at any time been uttered than the question addressed to the leaders of the Opposition whether they would, if opportunity offered, be ready to take up the reins of government. If it were necessary to return an answer, they might fairly insist that the present Ministers should abate the anarchy and misgovernment for which they are responsible. It is true that a Conservative Government would find still greater difficulty in repressing Irish disorder. There can be little doubt that, if they had arrested the chief demagogues of the Land League, some members of the present Cabinet would be rousing the Irish to fury by denouncing the breach of the Constitution. The present Opposition, as represented by its regular leaders, has, like the Irish gentry, supported the Government from the time when it first began to discharge its primary duty. They may well complain of their inability to rely on the loyalty of some of their opponents. None of the scandals which have been denounced in the conduct of recent elections has been so outrageous as the issue, on behalf of the Irish SOLICITOR-GENERAL, of a placard in which the authors of the document advertise, in recommendation of the official candidate, some of the most iniquitous decisions of the Sub-Commissioners. A list of the rents of several farms, with the extravagant reductions to which they have been subjected, is published as an inducement to the farmers to vote for a member of the Government which promised justice to the landlords. The bid for the Irish vote in North Durham sinks into insignificance in comparison with the appeal of Mr. PORTER's friends to the cupidity of Ulster tenants. Unless the placard is disavowed, it will seem as if a Law Officer of the Crown had not only sanctioned the proceedings of the Sub-Commissioners, but taken credit to his colleagues and superiors for a gross perversion of the law. Even if the decrees had been strictly consistent with justice, it would have been unbecoming to represent an ostensibly judicial decision as a benefit conferred on a certain portion of the community by a political party. The ruin inflicted on Irish landowners, the spoliation with which English landowners are threatened, may probably have produced a general distrust of the Government in the minds of constituencies which are not themselves immediately affected. There is no doubt of the feeling with which Mr. GLADSTONE and some of his colleagues are regarded by moderate politicians and by those who have much to lose. On the other side, they may count on the enthusiastic co-operation of all the Radical Clubs in England.

#### SPEECHES OF THE WEEK.

THE chief speeches of the week have not been political. Sir RICHARD CROSS has been making the tour of his constituency, and has offered what it was expected from him that he would offer, the views of a very fair and moderate Conservative on the questions of the day. But otherwise the principal speakers have dealt with questions which are only political in the sense that, while there is a general agreement as to principles, parties vary somewhat as to the mode in which these principles are to be applied. Sir THOMAS ACLAND spoke on agricultural depression; Mr. CHAMBERLAIN on the difficulty of getting Bills through Parliament which are not pushed on by the fervour of party; Mr. COURTNEY on the proper management of political associations. These are all subjects of importance to the whole community, and the differences they provoke are not, properly speaking, party differences. Sir THOMAS ACLAND wishes to see the owners of life estates invested with the power of selling, either to get rid of incumbrances, or to obtain capital for the improvement of the land they retain. These were precisely the objects which Lord CAIRNS sought to attain in his Bill of last Session. Further, Sir THOMAS ACLAND wishes to see the cultivator secured in his unexhausted improvements, and no one has come forward more prominently to give the tenant this security than so vigorous a Conservative as Mr. CHAPLIN. There will be no difficulty in getting Parliament to give every reasonable aid to agriculture that legislation can give. But the further inquiry is pushed the more clearly will it appear that agricultural depression is

very little connected with defective legislation. The depression is greatest in the heavy lands of Nottinghamshire and the adjacent counties. There a custom rigidly upheld gives the tenants everything they can possibly wish for in the way of compensation. They never think of leases, hold on as long as they like, and go when they like, sure of being repaid for any outlay by the incoming tenant. But now large tracts of land are left unoccupied, because one set of tenants has lost its capital, and no other set of tenants likes to face the chance of losses in wet seasons. Legislation cannot help agriculture when it is not a question of the amount of rent or of the terms of tenure, but of a business into which men of business will not go. In order, however, that agricultural legislation may seem to have some grand aim, one set of speakers clings to the notion that a system of peasant-proprietorship should somehow be established in England. Legislation might foster such a system if the State chose to lend money to the poor to enable them to buy land. There is no more reason why the State should lend money to enable a poor man to grow corn than why it should lend him money to make bread or to carry loaves about in carts. Unless the State makes all taxpayers pay to give a bonus to one set of adventurers, legislation cannot help or hinder peasant-proprietorship. The simple fact is that peasant-proprietorship in England is a bad business. It already exists. There are thousands of peasant-proprietors at this moment in Lincolnshire and Yorkshire, and of all sufferers from agricultural depression they have been the greatest. It does not extend, because it would not pay to extend it. There is any amount of land to be bought now by peasants if they had the money and chose to purchase. The poor do not purchase because they have not got the money, or, if they have, they know that the worst possible investment they could select would be the purchase of a tiny plot of land on which they would have to work like slaves, and which would ruin them in the first bad season.

Mr. CHAMBERLAIN was entertained by the Carpenters' Company; and, after paying a tribute to the merits of his hosts as affording an excellent specimen of local self-government, he went on to say that it pained him deeply to think how very imperfect the system of local self-government is in London, outside the City. But he explained that it was of no use that he personally should see the evil, and be desirous, or even ready, to provide a remedy. He is only President of the Board of Trade; and the President of the Board of Trade cannot even get Bills such as the Bankruptcy Bill, in which all traders are deeply interested, through a Parliament which does not for a moment deny that the present bankruptcy system is full of the most scandalous abuses. Parliament cannot pass Bills which it knows it ought to pass because it is hampered by the obsolete rules of its own procedure. The correction of the rules of Parliamentary procedure is not in itself a party question. It was quite as unsatisfactory to Lord CAIRNS as it can have been to Mr. CHAMBERLAIN that he could not get his Bankruptcy Bill through an overworked House of Commons. Every sensible Conservative would be glad to see the House made more efficient as a legislative body, provided efficiency was understood to mean, not merely rapidity in passing Bills, but adequate deliberation in discussing them, and an adequate power of improving them. But directly any one of any party sets himself to consider how the procedure of the House of Commons can be profitably altered, he finds that he is plunging into a very large question. Mr. CHAMBERLAIN and other Ministers who have Bills in which they take a lively interest, but which they cannot get passed, very naturally think and speak of the House of Commons as if it was only a legislative body. But it is not only a legislative body. It is also the administrator of the national money, and it is a court of inquiry before which the Executive is daily called to defend itself. Then, as a legislative body, it works in a double capacity. It sits to consider the Bills which the Government presents to it, and which the Government has a more or less definite wish to see passed. It also sits to consider the tentative schemes of legislation which any member may present to it, not so much with the hope of getting his Bill passed as with the object of awakening public attention to a project which he personally thinks of great importance. If from the total time during which the House sits we deduct the time given to the Budget and the Esti-

mates, the time consumed in examining the conduct of the Executive, and the time assigned to private legislators, it will be found that the period remaining for the discussion of Government measures is not at all large. That this comparatively short period should be turned to better account than it is at present is the object, not only of Mr. CHAMBERLAIN, but of the majority of members of both parties. But the Opposition naturally wants to know how the Ministry proposes to effect its purpose. Passing more Bills in the same time may mean doing good work more quickly, but it may also mean doing bad work quickly; and to do its work well the House of Commons must take time not only to see that a Government Bill is made as perfect as it can be, but also that it shall be sufficiently discussed to convince the country that it is wanted, and to let the country know what is being done.

Mr. COURTNEY presided on Thursday at a first meeting of a Liberal Working-Men's Association. There was hardly a word that he uttered which might not have come equally well from the lips of a sound and intelligent Conservative. He drew a comparison between the richer and the poorer classes of voters, and while he complimented working-men on their superior readiness to take the moral or emotional side on any question which permits a summary decision in obedience to the nobler feelings, he honestly told his working friends that they were sadly deficient in every question which demanded knowledge or patient investigation. On financial questions he had noticed that working-men thought the world had an inherent tendency to go wrong. Protectionists may be fools, but they count the mass of working-men in the civilized world among their members. Mr. COURTNEY implored his listeners to go to work in a new way. If they wished to vote rightly, they must learn to weigh every side of every question, to suspend their judgment, to seek knowledge from every quarter. But those whom he addressed were not only working-men, they were also members of a Liberal Association, and Mr. COURTNEY was urgent in pressing on them the dangers to which all political associations are liable. The chief danger is that the machinery comes to be thought of as infinitely more important than the objects to which the machinery is nominally directed. The intelligent working-men of Liskeard are to take proper precautions against this danger. They are not to be the tools of wire-pullers. They are to think for themselves, to decide what are the objects for which their machinery is to be used, to convince themselves by long painful thought that these objects are good, and then to use their machinery. Above all, Mr. COURTNEY warned his hearers against concentrating their thoughts on some one man and making him their hero and idol. He thought it a bad sign for France that it had got into the way of thinking that M. GAMBETTA is everything, and that Republicanism has no meaning until M. GAMBETTA expounds what it means. In the same way, while paying a hearty tribute to the great qualities of Mr. GLADSTONE, he had the courage to own that he thought it a misfortune for the Liberal party that it pinned its faith so entirely on one man, and did not study its own principles and work for their triumph apart from any man or men who might temporarily happen to be their chief representatives. This is all excellent in its way. It would be a great gain to every party, and to the whole country, if voters of the humbler class—that is, the great majority of those who have votes—would begin by recognizing their complete ignorance, would earnestly seek to be instructed, would resent wire-pulling, and would bring the utterances of popular favourites to the test of abiding principles. In itself Mr. COURTNEY's philosophical lecture was unexceptionable, and, if it seems something like a satire on the party to which Mr. COURTNEY belongs, that was not, perhaps, the fault or the intention of the lecturer.

#### M. GAMBETTA AND THE SENATE.

THE French Senate has not lost the courage which it showed in the rejection of the *Scrutin de liste*. It satisfied itself at that time that there were bounds to M. GAMBETTA's power, and it now seems disposed to make further experiments in the same direction. There is but one opinion among moderate Frenchmen as to M. GAMBETTA's unwisdom in appointing M. PAUL BART to the united Ministries of Education and Public Worship, and on Saturday the Senate had an opportunity of giving

indirect expression to this opinion in the election of a Life Senator. M. HEROLD, the Prefect of the Seine, is already a Senator; but he is prevented by the fact that he is a Prefect from offering himself for re-election. Consequently the Government had either to submit, to see him excluded from the Senate or to bring him forward as the candidate of the Left for the vacant Life Senatorship. Unluckily for M. GAMBETTA, M. HEROLD stands in an exceptional position towards the Senate. He has been the object of a vote of censure, and he has not pushed his respect for his colleagues to the point of resigning in consequence of that vote. Even a Second Chamber does not like to see its blameworthy treated as of no importance by one of its own members, and the Senate has not forgotten its grudge against M. HEROLD. Either by accident or design, the candidate put forward in opposition to him was the very Senator who had moved and carried the vote of censure. M. DE VOISINS-LAVERNIÈRE is said by the supporters of the Government to be an utterly unknown man. But this one achievement was sufficient, in the eyes of a grateful Senate, to give him all the distinction required to secure his election. The section of the Left which follows the lead of M. JULES SIMON supported M. DE VOISINS-LAVERNIÈRE as a matter of course, and a few additional recruits from the Moderate Republicans assured him the victory. No doubt the particular act which had called down on M. HEROLD the censure of the Senate had its share in bringing about this result. M. HEROLD had allowed zeal to outrun discretion about the time of the secularization of the elementary schools of Paris. His confidence that the Bill would pass led him to regard it as passed already; and in this conviction he had the crucifixes torn down from the walls of the school-rooms, and carried off in cabs, in a more or less broken state. The precipitation and indecency with which this was done offended a large number of persons who would have borne with much equanimity the removal of the crucifixes at a proper time and in a proper way, and M. HEROLD has found to his cost that feelings of this kind are not invariably impotent, even in France.

The judgment of the Senate upon the policy of the new Government cannot be without its weight, even in the eyes of so omnipotent a Minister as M. GAMBETTA. The one announcement in his programme which is decided and unmistakable is the need of a revision of the Constitution in reference to the method of electing the Senate. This revision, however, he cannot obtain—"speaking legally," as his organ puts it—without the consent of the Senate. He hopes, of course, to make this consent sure by the elections which are to be held in January. A third of the elective Senators will then be renewed, and it is believed that the Republican majority in the Senate will thus be assured. Probably, however, there is just enough uncertainty about these elections to make M. GAMBETTA feel happier if the proposed constitutional reform could be obtained from the existing Senate. Sometimes the effect of election into an assembly of Conservative tendencies is to impart a share in these tendencies to the new member. To become a defender of the independence of the Senate may conceivably, therefore, have attractions even for Senators who passed for good Ministerialists at the time when they offered themselves to the electors. Even the necessity of admitting that, until the Senate has undergone its first complete renewal, it is useless to look for its support may be annoying to a Government which loves to think itself irresistible. At all events, it would be a gain to the prospects of revision if it were known to find favour with the Senate as at present constituted. Unfortunately the argument against revision is from every point of view immensely strong. A Constitution can only lose by being pulled to pieces within seven years of its first creation. No institutions, however deeply rooted they may be in the popular affection, can afford to dispense with prescription. Each year that has passed since 1875 has made the existing French system better known, and on the whole better liked, by those who have to live under it. If it is now to be revised because in one particular it displeases the leader of the Left, the public belief in its stability will be greatly weakened. Constitutions, like laws, should be "made for every degree," and the discovery that they are not made for M. GAMBETTA will not be calculated to increase the respect in which they are held. It is particularly dangerous to amend a Constitution which is still very young when there is no real agreement among those who will have to

revise it as to the extent to which the process ought to be carried. The Ministerial theory on the subject is extremely simple. The Government will announce to both Chambers what the change effected should be, and the Chambers will thereupon form themselves into a congress to accept or reject the proposal. In this way the whole affair becomes a plebiscite in miniature. M. GAMBETTA determines that he would like the Constitution modified, satisfies himself that a majority in the Congress is of the same way of thinking, and straightway asks them to say Aye or No to a point-blank inquiry. This, however, is not the view taken by the Extreme Left, or by the Legitimists, or even by all moderate Republicans. The Extreme Left are clamorous for a revision which shall abolish the Senate. The Legitimists, always anxious to embarrass the Government, can only justify the momentary coalition they wish to effect with the Extreme Left by the plea that, as a revision of the Constitution may one day or other be the means by which France will cease to be a Republic and become a Monarchy, it is not their business to set limits to the powers of the revising Assembly. The moderate Republicans, who do not wish to see the Constitution revised at all, support the wider theory of the powers of Congress, because it strengthens the argument by which they hope to show that revision in any shape is a very dangerous tool to play with.

It seems not unlikely, taking all these considerations into account, that the proposal for revision will meet with considerable opposition in the Senate—an opposition which may not be removed by the January elections. These elections will be held with the existing constituency, and the motives which govern the electors who choose the Senators have not always been identical with those which govern the electors who choose the Deputies. The Conservatives indeed may even be benefited by the circumstance that this is the only question upon which the contest turns. If no mention had been made of revision, they would have had to speak their minds on the general policy of the new Cabinet, and upon this there might have been great difficulty in arriving at any common formula which could be adopted alike by Legitimists, Orleanists, Bonapartists, and Conservative Republicans. It is different when the issue concerns the method of election to the Senate and nothing else. Upon this point Conservatives of every shade may be in complete agreement, and there is at least a chance that they may find the present electors indisposed to lessen their own importance by admitting others to share their dignity. The chief feature of the reform which M. GAMBETTA is anxious to see introduced is the abolition of the present equality among the communes as regards the choosing of the electors. He wishes each commune to be represented in the Electoral College in at least an approximate proportion to its population. However agreeable this change may be to the larger towns, it remains to be seen whether it is equally so to the many towns and villages which now enjoy a degree of importance in the Electoral College to which, in M. GAMBETTA's estimation, they have no just title. Nor will he have the advantage of being able to point to any deadly sin on the part of the Senate as a justification for provoking the excitement and risks of a constitutional revision. What has the Senate done that makes it necessary to change the mode of election? In answering this question M. GAMBETTA can go no further back than his own speech last May, in which he praised the Senate as being a most valuable element in the Constitution. He must find reasons for what he wants to do that have arisen within the last six months. The only acts of the Senate to which he can point are the rejection of the *Scrutin de liste* and the insertion in the measure for secularizing the communal schools of a direction to schoolmasters to teach the children their duty to God. The votes given in January will show whether either of these measures are as distasteful to the various bodies who have to nominate the Electoral College as M. GAMBETTA appears to believe. The Conservatives could not wish for an issue better fitted to give effect to any influence they may still have with their countrymen.

#### SCOTCH DISESTABLISHMENT.

A SECTION of the Scotch Free Church has determined to begin an active agitation against the Establishment. Although the proposal was only resisted by a small minority, it was observed that the attendance at the meet-

ing was scanty. Twice as many zealous ministers and elders habitually take part in the proceedings when from time to time an alleged heretic deviates to the right hand or to the left from the strict lines of the Westminster Confession. Although there seems to be much difference of opinion as to the reasons for assailing the Established Church at the present moment, the agitators, and perhaps those who stand apart from the movement, are entirely unanimous in theological, or rather ecclesiastical, hatred. English critics, though they earnestly disclaim any comprehension of the delicate shades of Scotch dissent, are generally aware that Presbyterian sects differ on points of discipline, while they apparently agree in doctrine. The Free Church secession was caused by the inability of even Scotch statesmen to understand the earnestness of the objection which was entertained to secular interference and lay patronage. The founders of the Free Church, like the Reformers of the sixteenth century, held that establishment was not only allowable, but indispensable; and they and their successors have always since contended that the body which retained its connexion with the State was guilty of usurpation or intrusion. In full accordance with its principles, the Free Church has accumulated large endowments; and probably for some time it may have hoped to resume in more favourable circumstances the rights which, according both to the possessors and to the claimants, belonged to the National Church. It would seem that the expectation, if it were ever seriously entertained, has now been abandoned. Like the Irish Roman Catholic clergy in 1869, the Free Church ministers have resolved that the prospect of accession to the privileges of the Establishment is too remote to justify the further postponement of triumph and revenge.

The grounds of the animosity which is to be gratified by disestablishment, as far as they are not of a spiritual kind, are simple and intelligible. The ministers of the Scotch Church are better endowed than their rivals, and they enjoy the support and good will of the upper classes. The majority of the Scotch gentry probably belong to the Anglican Church, and a few of them adhere to the Free Church; but the Presbyterian landowners for the most part remain in the Establishment, which is also to some extent recognized and favoured on grounds of public policy and social expediency by the Episcopalians. The Free Church ministers have often complained with apparent justice of the impediments which have on some estates been placed in the way of the provision of sites for their churches and mansees. Economical and social jealousy is stimulated by approximate equality of condition, and by apparent identity of religious belief. Many Englishmen and a few Scotchmen hoped that the vehemence of antagonism would be mitigated by the removal of the ostensible cause of secession when the late Government passed a Bill for the abolition of lay patronage; but the ministers of the Free Church, perhaps not unnaturally, resent the legislation which has deprived them of their most plausible grievance. Only one Englishman professes to understand the connexion of the Patronage Abolition Act with the agitation for disestablishment; and Mr. GLADSTONE has never taken the trouble to explain a paradox which to the Free Church perhaps appears as a truism. The Duke of ARGYLL, who published a pamphlet on disruption before he was of age, and who has since followed the Free Church controversy with unabated interest, was the chief supporter of the Patronage Bill; but the tortuous ingenuity of an over-subtle intellect apparently enables Mr. GLADSTONE to comprehend Scotch ecclesiastical puzzles better than the ablest of born Presbyterians. A slight reason will serve the purpose of a revolutionary politician in search of a pretext for a second measure of disestablishment. Another bond of union between Mr. GLADSTONE and the Free Church agitators is to be found in the nickname which is bestowed on the opponents whom they respectively most dislike. For many generations hostile Presbyterian sects have denounced each other as Erastians. Mr. GLADSTONE, in one of his essays, enumerating religious parties and their different degrees of error, placed Erastians at the bottom of his list, immediately after Atheists. If, therefore, the Free Church can persuade Mr. GLADSTONE that the objects of their enmity are Erastians, their cause will be won.

One of the criminal characteristics of the Scotch Established Church is of recent origin. When a large number of the most orthodox zealots seceded on conscientious grounds it was found that the residue was comparatively inclined to tolerance, or, in sectarian language, to latitudi-

nationalism. Of late years almost all the prosecutions for heresy which have been instituted in Scotland have been promoted in the Free Church Ecclesiastical Courts. Erastians belonging to Established Churches are less exacting as to the opinions of a minister who causes no scandal and who discharges his practical duties. There is undoubtedly much to be said in favour of strict enforcement of unity of doctrine; nor is this the place or occasion for discussing the comparative evils of excessive rigidity and of tempting elasticity. It is possible that the susceptibility of Free Church divines may succeed better in the maintenance of traditional Presbyterian orthodoxy than the careless acquiescence which is attributed to the Established Church; but in the impending contest the stern champions of Northern Puritanism will find themselves strangely allied with the opponents of all articles and creeds. Liberal politicians, though they will cordially welcome the alliance of the Free Church Holy Office, will not be deeply impressed with the mischievous tendencies of the wider Biblical criticism which is permitted in an easy-going Establishment.

Even a slight and fragmentary report of the discussion at the Free Church meeting for disestablishment shows that the agitators, notwithstanding their sectarian enthusiasm, are not unconscious of the anomalies of their present position. A few of them remember how CHALMERS and some of the other leaders of the secession considered the maintenance of a National Church to be the most sacred duty of the State. It was only because the Government of the day recognized a Church which had become heretical or schismatic that the dissentient ministers abandoned their benefices and their legal position. Accordingly there were several disclaimers of complicity with the Liberation Society, and with other opponents of the principle of Establishment. Others protested against any connexion with political parties, though it is evident that their sole chance of defeating their antagonists will be furnished by their employment of political machinery. For the present the Free Church even stands aloof from the United Presbyterians and from the other dissenting sects which will join in the attack on the Established Church. The bond of union which is, in the proverbial phrase, constituted by common enmities is in this case partially weakened by the cross feuds which separate Free Churchmen from professed Nonconformists. As the agitation proceeds, all the sects and factions will find it necessary to suspend their reciprocal animosities in the prosecution of a joint enterprise. That the political and economical results of disestablishment will be wholly evil is a consideration which will have little weight either with ecclesiastical zealots or with subversive democrats. Eager Presbyterians will find too late that their organization will be disturbed and their influence fatally weakened by the victory which they will assist Secularists in winning. Even the endowments of the Free Church, amounting to some millions, will be less secure when the property of the Established Church has been alienated. Some time will elapse before ecclesiastical interests are confided to the care of an English or Scotch Minister of the type of M. PAUL BERT; but the tendency of modern revolution is illustrated by the present condition in France of a Church which not long since was supposed to be national and dominant. The Free Church, with the aid of its natural opponents, will perhaps succeed in its present enterprise. Mr. GLADSTONE shares its mysterious objection to the Bill for the abolition of patronage; and Lord HARTINGTON was persuaded by the late Mr. ADAM to bid for party support by making disestablishment an open question. It is a not improbable conjecture that the expected triumph may be fatal to the Presbyterian system and to the doctrines which it preserves.

#### PROGRESS OF CONFISCATION AND ANARCHY.

ONCE more the winter is closing in, and once more life and property are becoming absolutely unsafe in large districts of Ireland. Last year excuse was made by the Government and its partisans for the permission of this state of things. Force was no remedy; redress of wrongs must precede punishment of crime; the House of Lords and its treatment of the Compensation for Disturbance Bill were to blame for the anarchy of Ireland. This

year no such excuse is possible. The remedy and the redress have been provided as simply as the heart of Mr. BRIGHT himself could desire; the Government have been furnished by the joint effort of their political friends and their political enemies with engines of coercion carefully selected and adjusted by themselves, and, so far from any obstacle having been put in the way of their plans for Ireland, they have been allowed *carte blanche* to loose and to bind exactly as they please. Their Sub-Commissioners are cutting away the rents of those landlords whose interests they are charged to respect, by thirds and halves; every point is being strained to give the tenants the full advantages, and more than the full advantages, of the Act; and the other courts of justice in Ireland are looking on in blank astonishment at the rapid and irresponsible manufacture of a new code of precedent, procedure, equity, and law. Meanwhile, murder and outrage of every kind are once more becoming the order of the day. It was simply owing to the bad marksmanship of the would-be assassins that murders more audacious than those of Lord MOUNTMORRIS and Mr. BOYD were not in two cases committed last week in the West and centre of Ireland. Other selected victims have been less fortunate. Nor does it mend the matter that, in at least one case, that of Miss GIFFORD, where actual murder has been committed, plunder rather than revenge seems to have been the motive. For this shows that the boasted immunity of Ireland from crimes other than agrarian is disappearing under the general temptation to lawlessness which prevails. It was, indeed, impossible that such doctrines as have been preached in Ireland with impunity, and even with profit, should fail of a more general effect than the preachers intended.

In such a state of things it is with some impatience that sensible men will receive the platitudes uttered by the less decided supporters of the Government, among whom it would appear that the *Times*, after considerable vacillation, must now be ranked. It is excusable enough for a Lord Lieutenant placed in the awkward circumstances which surround Lord COWPER to talk as he talked at Belfast on Wednesday. Although Irish Viceroy exercise a very variable influence on Irish policy, no one in the present instance dreams of attributing any initiative to the actual incumbent of the office. To oblige Mr. GLADSTONE, Lord COWPER holds a very uncomfortable, and not over-dignified, position; and, when he pledges himself not to retire from it, there is a certain gallantry, not to say heroism, about the pledge which atones for the indecision and triteness of his other utterances. English critics, however, are in no such difficult position. Lord COWPER can probably go no further with safety than the admirable, but scarcely practical, remark, "I think that this is a time when everybody, whatever his politics, should join together in the defence of civilization and authority." But when these vague copybook headings are echoed and repeated by persons on whom no official responsibility rests, the proceeding approaches imbecility. To say that "the paramount necessity of the moment is that of restoring order and of vindicating the authority of the law" might be an excellent saying if the same necessity had not been paramount and neglected for every moment of some twenty months. To admit that "what has been done for the restoration of order in Ireland is likely to be more effective in the end by reason of the delay in beginning" is simply to acknowledge misunderstanding of the present and ignorance of the past. Nor does it mend the matter to decorate platitudes of this kind with scraps of the mischievous jargon about national consciences, moral forces, and so forth, which Mr. GLADSTONE has made fashionable. The plain truth is that the Government has as yet shown neither the will nor the ability to deal with the anarchy of Ireland. A more astonishing and deplorable spectacle has seldom been presented in history than that of Mr. FORSTER sitting at the gate of Kilmainham alternately ushering prisoners in and letting them out, and imagining that by this process he will pacify Ireland. The only explanation of the trifling is either that the Government is simply disabled, and knows that it is disabled, by its past from adopting more forcible measures, or else that the clamour already raised by its own extreme supporters against the earthquake-pill of arresting suspects has daunted it. In either case, it is equally evident that the most pressing duty of the present time is in hands which are unequal to it.

How deeply compromised the Government is may be seen at a glance by looking at the proceedings of the Land Commission. There may be thought to be some signs of consternation in Mr. GLADSTONE's guarded answer to the letter which brought before his notice Professor BALDWIN's famous dictum of spoliation. It would not be surprising if even Mr. GLADSTONE's heart, though it be of the stoutest, quailed at the prospect. We are told that "No Rent" is "hateful to the people of England and Scotland"; that they "will give no countenance to a flagitious repudiation of solemn engagements." A national conscience swallowing confiscation up to fifty per cent., but choking at anything more; a national conscience refusing to see a repudiation of solemn engagements in such decisions as that in the CRAWFORD case, and that in which, the other day, a Sub-Commissioner cut off some twenty per cent. of the value of an estate bought by the holder on the security of the nation, and undisturbed by him in its rental since the purchase—this is a very singular kind of moral sense. It is not difficult to do more justice to Ministers than their half-hearted advocates dare to do. Mr. GLADSTONE and his colleagues no doubt perceive the fatal position into which they have half knowingly and half unconsciously glided. They have set a premium on refusal to pay rents; how can they hang and shoot those whose only fault is that they mistake or decline the recent invitation "thus far and no further"? They have introduced a state of things in which, as no less a person than the CHIEF JUSTICE of the Irish Common Pleas said the other day in open court, "The action of justice is suspended, and "Magna Charta in a manner defeated." How are they to act with vigour against ignorant and misguided men who do not understand the exact articles of Magna Charta and the exact varieties of justice which are for the time in abeyance? The lesson of their perplexity, it is true, is one which seems hardly to have been needed. But, as a matter of fact, there is no doubt that it exists. It is possible, of course, that they may take heart of grace at last, and, throwing consistency to the winds, may act with rigour against those who, by Mr. CHAMBERLAIN's own admission, have been their greatest friends and most efficient assistants in the past? But even then the Land Commission, unless the superior Court acts in a very different way from the subordinate and itinerant divisions, is a standing and perpetual incitement to the people to continue the very course which the Government are endeavouring to check. The contradiction is fatal, but unavoidable; while the still worse difficulty of having to face the exasperation of tenants who find their reductions of rents unconfirmed is at least possibly in store for them. It is idle, then, to talk of the question of the previous conduct of the Government being a "barren" question. It is not barren; it is only too fertile in disastrous results which are evident every day. The reckless conduct of the Sub-Commissioners is, in the peculiar condition of Irish thought and society, a positive and direct incitement to violence and rent-withholding. These two things, the Irish tenant-farmer may say to himself, have already wiped off half our rents; let us continue them, and we shall wipe off the other half. Confiscation and anarchy are thus connected inevitably from the point of view of the people, while from the point of view of the Government their encouragement of confiscation weakens, if it does not actually paralyse, their hands in putting down anarchy. It is indeed much to be hoped that the national conscience so often talked of will insist on measures being taken to prevent the annals of England from being blotted with a second disgrace like that of the winter of 1880-81. But it will hardly do this without a clear comprehension of the facts of the case, and that clear comprehension will show that, if it is specially the duty of the present Ministers to apply the remedy, it is because they are specially to blame for their encouragement of the disease.

#### THE LATE MR. GREG.

THE death of Mr. W. B. GREG justifies some notice of a writer and politician who, though he never attained popular notoriety, exercised considerable influence in his time. Mr. GREG's attention was probably first directed to political economy by his interests as a manufacturer; but even before he retired from business he pursued the study on his own account. Many of COBDEN's earlier allies and followers became and remained politicians, because demo-

cratic agitation was the most effective instrument which could be used for the removal of their special grievance. Mr. GREG naturally became a Liberal, because he desired certain definite changes which could only be accomplished by the aid of the party of movement; but in his later years he doubted whether the forces on which he had relied were not becoming irresistible and dangerous. His apprehensions would have become more acute if he had retained his vigour long enough to take part in the controversies which have thus far resulted in the Land Act, and in the iniquitous decisions of partisan judges. An economist of the last generation never thought it possible that the first postulate of the science would be disputed either in theory or in practice. The whole value of political economy rests on the assumption that property belongs to the owner, to be used according to his estimate of his own interest. The managers of the Corn-Law League contended with conclusive force that Protection was unjust, because it prevented them and their workmen from using their capital and labour to the best advantage. That the rent of land was a legitimate form of income it never occurred to them to dispute, though they objected to the artificial increase of rents at the expense of the community by vicious legislation. Mr. GREG, or indeed Mr. COBDEN, would have been startled by the proposition that rent was a tribute improperly levied on the property of the tenant.

During a long life Mr. GREG was a voluminous writer both on general and on occasional topics. He was associated with Mr. JAMES WILSON and with Mr. BAUEHOT as a contributor to the *Economist*. He wrote anonymously or under his own name in more than one other periodical; and he published several volumes on different subjects. His knowledge and his habits of business recommended him to Sir GEORGE LEWIS for an official appointment which he held with credit for several years. He had by nature both an active curiosity to ascertain the truth and a zeal to convert others to his opinion, which is of more doubtful advantage. There is something attractive and human in a sociable intellect which is never content with its own conclusions unless others can be persuaded to accept them; but a certain reserve is also not without its advantages. Young men of active minds are always making discoveries and courting proselytes; but maturer age generally hesitates to propagate novelties unless they tend to practical utility. In this respect Mr. GREG always remained young; and there is no reason to believe that he regretted the candour with which he had expressed opinions on many subjects. On questions of economy and currency he was entitled to trust to his sound grasp of principles and to his practical skill in applying theories to practical cases. Although his writings are not distinguishable from those of his colleagues or associates, it may be taken for granted that a constant contributor to the *Economist* must have done much to extend knowledge and to dispel popular illusions. In philosophical and theological controversies Mr. GREG exhibited the same earnestness and good faith; but in these departments his authority was less, and the benefit to be conferred by the publication of disputable opinions was more than doubtful. The duty of preaching the truth in or out of season, if it has any existence, must be contingent on the certainty that the doctrine is true. Mr. GREG had not attained to the fanatical zeal of a later writer who asserted that reticence on serious subjects indicated want of faith in humanity. It is difficult to understand why indiscriminate iconoclasm should be limited by an arbitrary belief in a newfangled and imaginary idol. In dealing with transcendental subjects, which he might perhaps have advantageously avoided, Mr. GREG had at least the merit of not being either a partisan or a devotee of extremes. One of his latest essays was written in answer to a whimsical contention that a future life would consist, not in the prolongation of personal identity, but in the probable continuity of the human race. Perhaps few anxious inquirers were satisfied by the assurance that, if they were not to live after death, somebody else would, with equal advantage to the world, take their place for a season. When HOMER preached the same doctrine, he compared the generations of men to leaves which decay in autumn, to be followed by other leaves in spring. Mr. GREG had little sympathy with far-fetched, sentimental paradoxes.

A manufacturer and Free-trader belonging to the same generation with Mr. COBDEN and Mr. BRIGHT could scarcely

fail to sympathize with the extension of popular power; but, if Mr. GREG resented the undue influence of the aristocracy, he confined his political confidence to the educated portion of the middle classes. An economist of forty years ago, convinced of the irrefragable soundness of his own doctrines, would have by preference vested political power in any class which could be trusted to cultivate utility and logical adherence to principle in disregard both of prejudice and of interested selfishness. The gradual conversion of Sir ROBERT PEEL and of those who, in deference to his authority, followed his example may perhaps have seemed to Mr. GREG an ideal instance of the most desirable political process. Some of his associates in the Free-trade contest may perhaps have valued the means by which their victory was achieved even more highly than the object which was attained. The proof of the power of numbers and of the efficiency of agitation gratified the complacency of democratic enthusiasts, while the interest of men of business and of reasoners was concentrated on the benefits to be derived from economic freedom. The shallower reformers of the time, instead of appreciating either the triumph of argument or the increase of democratic forces, attributed the successful result of the Free-trade struggle to the supposed force of organization. In the years which followed the repeal of the Corn Laws many leagues were formed on the model of the great Lancashire Association; but, though some of them, such as the Financial Reform Association of Liverpool, were countenanced by Mr. CORDEN and Mr. BRIGHT, they all proved in time abortive. A partial exception may be noticed in the Reform League, which was created exclusively for purposes of intimidation, and which by the Hyde Park riot contributed to the success of the Reform agitation of 1867; but the success of the agitation was due rather to the energy of Mr. BRIGHT than to the obscure demagogues who managed the affairs of the League.

Mr. GREG, who had never approved of the supremacy of the multitude, drew back at an early stage from the democratic movement. That taxation and representation should be finally dissociated from one another, that the protection of property should be entrusted to the recipients of weekly wages, seemed unreasonable to a utilitarian economist who neither worshipped nor implicitly trusted collective humanity. The alarm with which he regarded the growing power of the working classes may perhaps have been excessive or premature; but his distrust of the spirit of modern Liberal legislation has been justified by recent experience. It was difficult or impossible to anticipate the quarter from which danger was to be first apprehended. That ownership of land would be disturbed before a systematic attack was made on capital might perhaps have seemed improbable to a student of Continental democracy and Socialism. The social fabric is endangered from the moment at which the right of property becomes a subject of controversy. It may be that another system is possible, or even that it is compatible with civilization; but the experiment could only be tried after the most organic of revolutions. Mr. GREG, who had no kind of faith in social Utopias, repeatedly warned his countrymen of the probable results of the democratic innovations which are so carelessly welcomed by nominally moderate politicians. He was not unaware of the inutility of warning a community that it is floating with the stream to the edge of a cataract. He accepted the reproach which might have been addressed to the utterer of evil forebodings by assuming the legendary part of CASSANDRA, though the name was not strictly applicable. The Trojan prophetess was doomed not to be believed when she foretold the fall of Troy or the murder of AGAMEMNON. Mr. GREG, on the contrary, may perhaps have convinced many disciples, but only of an impending destiny which he and they were powerless to avert. The title of "Rocks Ahead!" which he gave to one of his warnings seemed to imply a possible exercise of discretion and of skill by a pilot; but it is certain that Mr. GREG, especially as he advanced in life, entertained no sanguine confidence in the future. With his own career and fortunes he had no reason to be dissatisfied. If he was not famous, he obtained general recognition among his equals; and he cultivated and habitually exercised considerable intellectual faculties. It is impossible to measure the influence which a well-informed and thoughtful writer may have exercised during a long career. It is only certain that Mr. GREG contributed much more than his share to the instruction of his contemporaries.

## MR. GLADSTONE AND SIR BARTLE FRERE.

WHEN history comes to consider the remarkable influence which Mr. GLADSTONE has exercised over England there will be at least one charge which cannot be brought against the present PRIME MINISTER. It can never be asserted that, like not a few famous statesmen in the past, he has made a mystery of his peculiarities. For many years, whether in or out of office, Mr. GLADSTONE has taken care to bring his idiosyncrasy fully before the public at comparatively short intervals. With a fairness which cannot be too highly commended, he places the documents for estimating his moral and intellectual fitness for the great position he holds before the eyes of any one who has eyes and who chooses to read. Perhaps some of the readers are so touched by this mark of confidence that they do not care to seem not to reciprocate it, and therefore refuse to examine the documents too narrowly. Perhaps the indispensable condition of possessing eyes to see is often wanting. Otherwise it is not easy to understand how there can be so much difference in the results arrived at. There is, indeed, a third explanation of the difficulty. These successive revelations of Mr. GLADSTONE's personality never fail to reveal one thing—his own undoubted belief in the rectitude of his own conduct and the infallibility of his own judgment. To a certain class of mind the following syllogism therefore becomes possible. What Mr. GLADSTONE thinks is true; that Mr. GLADSTONE is always right is what Mr. GLADSTONE thinks; therefore, that Mr. GLADSTONE is always right is true. The formal perfection of the argument is indubitable, and it seems to be, though less universally than it was eighteen months or two years ago, still generally imposing.

The correspondence published last Tuesday between the PRIME MINISTER and Sir BARTLE FRERE is the latest and one of the most interesting of these *pièces justificatives*. It is unusually instructive, from the accidental fact that even the most excitable partisan can hardly manage to regard it as a party matter. Sir BARTLE FRERE, partly by his fault and partly by his misfortune, is a person whom neither Liberals nor Conservatives have much reason to love. He did a very bad turn to the latter, and the former have behaved as shabbily as possible to him; so that, according to the general laws of human nature, he ought to be obnoxious to both. There is, moreover, an almost universal opinion in England that in his South African policy he—doubtless with the best of motives—inflicted a great injury on his country. But Sir BARTLE FRERE, like everybody else, is entitled to be heard on a question of fact; and it is a question of fact which is discussed in the long and somewhat embroiled correspondence to which we are referring. It should be said (for without accurate knowledge of this the correspondence is difficult to appreciate) that in the Midlothian speeches Mr. GLADSTONE accused Sir BARTLE FRERE of being one of "the two great authorities [the "other being Sir HENRY RAWLINSON] who supported the "Indian policy of advance into Afghanistan." Mr. GLADSTONE then went on to draw inferences to the effect that Sir BARTLE was "not conversant with free government or responsible government," and to urge that Sir BARTLE's "mode of action at the Cape of Good Hope did "not tend to accredit his advice in Afghanistan." As soon as Sir BARTLE FRERE, having served Mr. GLADSTONE's convenience (a convenience which, as may be remembered, could afford to overlook for some considerable time Sir BARTLE's "mode of action at the Cape"), was free to speak, the ex-High Commissioner wrote and published a pamphlet letter to his accuser. After this point the correspondence begins. The first letter from Mr. GLADSTONE is what may be called a vague but general request to let bygones be bygones, disclaiming the imputation of "moral error or reproach," and professing willingness to apologize if he has been wrong in any statement. This is followed by a letter from Sir BARTLE, pointing out what he has to complain of in the reference to Afghanistan. The letters are complicated by cross references to South Africa on both sides. Some of these, however, have nothing to do with the main point at issue, which is the imputation of having advised or favoured the policy of advance into Afghanistan. Sir BARTLE argues elaborately that he had never favoured that policy. Mr. GLADSTONE replies that he had "never had any reason to "believe, nor does he believe, that he was so grossly mis- "understood by any one in the country as to be supposed "to connect Sir BARTLE with the deplorable measures "taken in Afghanistan during the Viceroyalty of Lord

"LYTTON." Mr. GLADSTONE, however, "did think that Sir BARTLE was in favour of the policy of advance"; and his only object in mentioning the fact was "to give his opponents the benefit of Sir BARTLE's high authority." If he was wrong in the opinion, he regrets it; but, as to South Africa, he is not aware of having sought without warrant to treat the policy adopted there as Sir BARTLE FRERE's. This qualified and entangled apology brings out another long letter from Sir BARTLE, and then comes the most remarkable piece of the series. Had Mr. GLADSTONE stopped at the one just quoted he would have left himself in an awkward position, but not in half so awkward a one as that in which he now is. For he now says, "I have never knowingly used any words which could convey to an uninfamed mind the idea that you had advised the measures taken by the late Government against SHERE ALI." All that he did was "to admit in justice to opponents that you had been friendly to a policy of advance." Receiving Sir BARTLE's assurance of the error, Mr. GLADSTONE is "much gratified," and if Sir BARTLE regards his "erroneous admission" as a wrong he is quite willing to "express his regret." With regard to South Africa his object was "to say as little as he could and let that little lean as much towards Sir BARTLE and his views as he could." Finally, Mr. GLADSTONE "has not anything to retract."

This is the marrow of two columns of small print, and a very curious marrow it is. Mr. GLADSTONE asserts that Sir BARTLE supported and advised the Indian policy of advance into Afghanistan, and that Sir BARTLE's mode of action at the Cape of Good Hope does not tend to accredit that advice. The first statement is proved to be inaccurate—at least Mr. GLADSTONE accepts the proof by making no attempt to upset Sir BARTLE's evidence on the subject. Yet, notwithstanding this statement and the argument built upon it, Mr. GLADSTONE has nothing to retract; but, if he has nothing to retract, he has much to bring forward. He did use the words, "Sir BARTLE FRERE advised the advance into Afghanistan"—this is admitted; but he never used any words that could be interpreted as meaning that Sir BARTLE had advised measures against SHERE ALI. The measure against SHERE ALI was the advance into Afghanistan, and the advance into Afghanistan was the measure against SHERE ALI. The terms are absolutely convertible; yet Mr. GLADSTONE admits the one statement and denies the other, even as an inference. Further, Mr. GLADSTONE expressly used Sir BARTLE's African "mode of action" as an argument to discredit his supposed advice in Afghanistan. This, again, is admitted. Yet Mr. GLADSTONE now says that he never sought at any time to treat the course of policy pursued in South Africa without warrant as Sir BARTLE's, and that "the little he said about it leaned as much as possible towards him and his views." It is, according to Mr. GLADSTONE, leaning towards a person's views to say that those views are so bad that they are sufficient to discredit other views on another subject. After this it is almost superfluous to notice the characteristic description of a groundless accusation as an "erroneous admission," or the peculiarly comforting and not less characteristic argument that what looked like an attack on Sir BARTLE was really only an act of justice to Lord BEACONSFIELD. All this makes the question of merit as between the correspondents entirely irrelevant, though it is not surprising to find that it has been put in the foreground by Mr. GLADSTONE's partisans. It really does not matter much whether Sir BARTLE was in favour of the Afghan policy of the late Government or not. It is a question very interesting to himself and to historians, but of no actual importance. Perhaps it is of rather more actual importance that the PRIME MINISTER of England should deny that any uninfamed mind can see in an assertion that Sir BARTLE advised an advance into Afghanistan the assertion that he advised measures against SHERE ALI, and supported the deplorable policy of Lord LYTTON. It may be somewhat remarkable that in the same breath with an acknowledgment of regret for an erroneous admission, Mr. GLADSTONE should declare that he has nothing to retract. It is curious, to say the least, that a man who has said that Sir BARTLE FRERE's mode of action in South Africa does not tend to accredit his advice in Afghanistan should describe this as leaning as much as he could towards Sir BARTLE FRERE and his views in South Africa. This is the really interesting thing about the correspondence, and it is quite independent of the case against

Sir BARTLE and his policy, whether in India or in Africa. There would be no difference of opinion in private life about the conduct of any one who played fast and loose with facts and words in the way in which Mr. GLADSTONE here plays with both; and there would not be much difference of opinion about the conduct to be observed towards him in return. The curious thing is that the very persons who are most innocently blind to the inferences naturally drawn from this correspondence are the very persons who are most indefatigable in asserting that the morality of public and of private life is one and indivisible, and that action in both must be guided and judged by identically the same rules.

#### THE HOME SECRETARY AND THE LONDON SCHOOL BOARD.

THE HOME SECRETARY has taken the only course that he could properly take in reference to the St. Paul's Industrial School, and has remitted the whole matter to the Public Prosecutor. The degree in which there exists matter on which to found a criminal charge will now be investigated by the one person to whom this kind of inquiry properly belongs, and the fact that it has been referred to him relieves us of the obligation of saying anything more on this part of the subject. Whether acts of cruelty were committed in the school, and, if so, by whom, and at whose instance they were committed, are questions of which the public generally will gladly wash their hands. So long as the SECRETARY of STATE had not called in the Public Prosecutor, it was necessary to insist upon the grave character of the charges brought, and the apparent force of the evidence alleged in support of them. Now that these facts have been admitted, and are about to be acted on by the officer whom they most nearly concern, the matter may be safely left in his hands.

Two other questions, however, still call for further consideration. The first is the responsibility of the London School Board for what has taken place. It has been angrily denied that this body has any responsibility whatever as regards industrial schools. The inspection of these schools, it is said, belongs to the Home Secretary, not to the School Board. If he, with the requisite staff at his command, was unable to discover what was going on in St. Paul's School, how can the London School Board, which has no such staff at its disposal, be chargeable with negligence for not detecting what escaped Sir WILLIAM HARCOURT? The London School Board, as not infrequently happens in these cases, entirely mistake the nature and occasion of the censure that has been passed upon them. In our judgment there can be no doubt that they have been very greatly to blame in this business; but we willingly concede that the responsibility for what went on in the school rests upon the HOME SECRETARY and not upon the London School Board. He, not they, was the person who ought to have been kept informed of the character of the school and of the condition of the boys who were kept there. It is not because they were not informed about the school that the London School Board deserve grave censure; it is because, when the need of making themselves informed was brought home to them by circumstances, they paid no regard to it. It was natural that in the first outburst of public indignation the distinction between these charges should have been obscured. It was seen that the Board was greatly in the wrong at that moment; it was not seen at what precise point in the matter the Board had become wrong. The controversy that followed, passionate as it has been, has at least done away with this confusion. The Board may fairly be acquitted on the charge of having allowed abuses to exist which they had the means of checking. The Industrial Schools Committee, which has earned such unenviable notoriety, was not an inspecting body; it was simply a body charged with the transfer of children to industrial schools under the authority of the Board, and with the provision of additional schools in the event of those in being proving inadequate to the demand for accommodation in them. As such, the Committee was no more bound to see that the schools chosen were properly managed than the magistrate who sends a child to a reformatory is bound to consider whether the discipline he will there undergo is likely to reform him. But, when all this has been acknowledged, there remains quite enough to charge the Board with. As has already been pointed out, they stood to the children

they had sent to these schools in the relation of guardian to ward. They were exempted from the duty of making inquiry as to the character of each particular school, and as to the treatment the children underwent there, by the fact that all the schools had the certificate of the Home Office, were inspected by its officers, and had presumably borne that inspection satisfactorily. But they were not exempted from the duty of making inquiry as to the truth of specific charges against a particular school when these charges were brought before them, and, indeed, eagerly pressed upon them. To repeat an illustration formerly used, no one would blame a guardian if, having to send his wards to school, he chose a public school of good repute, without himself investigating the foundation of the character it bore. But if specific charges of cruelty were brought against the school at which he had placed his wards, and he refused or delayed to satisfy himself as to the truth of them, he would be very properly blamed. The London School Board had had notice that all was possibly not right with the St. Paul's Industrial School. They had had that notice in the remarks of the magistrate in dealing with the boys accused of setting fire to the school, and later on they had had it in the statements laid before them by Mrs. SURR. Their plain duty, on becoming acquainted with these causes of suspicion, was at once, either by themselves or by appeal to the HOME SECRETARY, to institute the necessary investigation. Instead of this, they did their best to keep the matter from the notice of the HOME SECRETARY by rescinding the motion to submit it to him, and they were late and languid in taking the duty upon themselves. This is the real ground on which the London School Board merits censure. Its members were loth to recognize—many of them possibly have not yet recognized—that they owed any duty whatever to the possible victims of the cruelties alleged to be practised in St. Paul's School. This unwillingness is so extraordinary that it can only be explained by the hypothesis suggested last week. The need for inquiry was discovered, and the obligation to undertake it pressed upon the Board, by the wrong people. If Mrs. SURR had belonged to the majority, all would have gone well. She belonged to the minority, and all went ill. If the London School Board wish to regain the confidence of the public, they will show some appreciation of the duty they neglected, and some regret for having been led away into neglecting it.

A still wider issue is raised by the last two paragraphs of Sir WILLIAM HARCOURT's letter to the Board. He admits that sufficient defects have been discovered in the particular school which has been under consideration to throw doubt upon the management of other similar schools. If these defects could go on undetected in one industrial school, they may remain equally undetected in another. The possibility of this has been confirmed by the discovery that equally gross abuses are complained of in an industrial school at Glasgow. It is evident, indeed, that the peculiar conditions of an industrial school lend themselves very readily to cruel treatment. The children sent to these schools are usually of a specially unmanageable type. They need to be treated with a good deal of strictness, and at times with a good deal of severity; and strictness and severity, when they have to be shown by unwise or incompetent people, may very easily degenerate into cruelty. The safeguards which exist in ordinary elementary schools are wanting here. The schools are boarding schools, not day schools; so that the intercourse between parent and child, which in ordinary elementary schools is suspended only during the time when a child is actually at school, is in the industrial schools suspended altogether. The children have no one to whom to complain of ill-usage—no one who is likely to find out, even if no complaint is made, that ill-usage has been practised. The only persons who have any opportunity of making discoveries on this point are the Government Inspectors, and it is to them that up to this time the public has looked to see that these schools have been rightly managed. They now learn that the inspection in question is of an extremely imperfect kind, and that the large number of schools makes it impossible for the present staff to introduce any effectual improvement. It is not wonderful that this discovery has greatly disturbed a large number of people. The idea of an industrial school is an excellent one. It seems to meet a want which can be met equally well in no other way. Consequently, money has been freely spent by charit-

able persons in setting up such schools, and by the rate-payers in supporting them when set up. There are reasons which make it desirable that no radical change should be introduced into the system under which these schools are maintained. In a boarding school, for example, it is impossible to put aside the religious difficulty. The managers of the school have the entire charge of the children, and, if they do not make provision for religious instruction, no religious instruction will be given. Now, judging from the recent action of the London School Board, is there any ground to infer that, if School Boards were substituted for charitably disposed individuals as the managers of industrial schools, things would of necessity be any better. The two things that seem to be needed, if the present system is to be retained, are provision for the appointment of an adequate staff of managers and for the adequate inspection of the school as carried on by these managers. At St. Paul's School the first of these conditions did not exist, for the sole manager was Mr. SCRUTTON, while the second, as we are told by the SECRETARY OF STATE himself, does not exist at any industrial school. Sir WILLIAM HARCOURT need bring forward no further evidence to establish his position, that "the time has come when the whole matter should be submitted to the investigation of an important and independent authority."

#### ST. MARTIN'S SUMMER.

THERE is an English proverb to the effect that one swallow cannot make a summer, but what is beyond the capacities of a swallow may be possible to a Saint. There are at all events two of the saintly company who are credited in England, and we believe elsewhere also, with the pleasant prerogative of making, or restoring, a summer that is already fled, though they do not unfortunately deign to exercise this prerogative as often as might be desired, and still seldomer do they both combine during the same autumn to put forth their beneficent powers. This year, however, it may fairly be said that we have had a St. Luke's summer and a St. Martin's summer in quick succession, but with a sufficient interval between them—about All Saints' Day—to preclude any risk of those jealousies from which even "celestial minds" are alleged not to be always free as to who might claim the dispensation of the charmingly unseasonable warmth. But if no rivalry is possible in this case between St. Luke and St. Martin, there is a further question, which has much exercised and in fact hopelessly confused one of our evening contemporaries, as to which St. Martin has a rightful claim on our gratitude. For it so happens that in the Roman Calendar there is a St. Martin, Confessor, on the eleventh, and another St. Martin, Pope and Martyr, on the twelfth, of November. And our contemporary, not being perhaps very deeply versed in ecclesiastical history, and naturally supposing that a Pope and Martyr must be a greater personage than a Confessor, somewhat rashly concluded that the St. Martin of November 12 had sent us the genial weather we have all lately been enjoying. That, however, is not at all the case. We hope we entertain a proper respect for Popes and Martyrs, and Pope Martin I., as may be gathered from Milman's account of his persecution by the Monothelite Emperor Constantine, was a man well deserving respect and sympathy, though it is only by a little stretching the term that he can be called a martyr, as he died from the cruel treatment he had received in his exile at Cherson. Nevertheless, it is not St. Martin, Pope and Martyr, commemorated in the Roman Calendar on November 12, who confers its designation either on Martinmas or St. Martin's summer, but his far more celebrated namesake, St. Martin of Tours, who figures as well in the Anglican as in the Roman Calendar on November 11. Nor is much additional light thrown on the matter by elaborately confounding Martin I., who is the martyr honoured on November 12, with his successor of seven centuries later, Martin IV., the French Cardinal who was elected Pope at Viterbo in 1280. The death or martyrdom of Martin I. occurred in 655, not—as the evening journalist imagined—nine centuries, but two centuries and a half after St. Martin of Tours, who died in 597.

"Who has not heard of St. Martin, Bishop of Tours, and Confessor?" are the opening words of Cardinal Newman's sketch of his life, originally published forty years ago in the *Church of the Fathers*. Alban Butler begins in similar terms his life of "the great St. Martin, the glory of Gaul and the light of the Western Church." And indeed from the very first his name was widely honoured in the Church, and especially in England, where even in British times there was—as there still is—a church dedicated to him at Canterbury, in which Bertha, the Christian Queen of Ethelbert, had been accustomed to worship before the arrival of St. Augustine. The large number of churches dedicated in his honour both in England and throughout Europe generally, from the time when first a chapel and soon afterwards a Cathedral was built over his tomb at Tours, which lasted on as venerated by Clovis till the French Revolution, would alone sufficiently attest the prevalence and permanence of this sentiment. Moreover, he alone of Confessors had a service of his own in the more ancient

brevaries, and had his name inserted by Gregory the Great with those of certain Apostles and Martyrs, in the Canon of the Mass. Nor are there many, even of the most famous of the old Christian saints, whose life has come down to us on testimony so trustworthy and precise, as his biographer, Sulpicius Severus, was a disciple, eyewitness, and intimate friend. Milman indeed complains of his credulity in miraculous matters, which however he only shares with his contemporaries, but fully admits his "polished and classical style," on which Cardinal Newman also dwells. Martin was born in Pannonia of heathen parents in 316, and brought up at Pavia in Italy; his father was a soldier, and he himself served some years in the army, but became in early youth a convert to Christianity. At the age of about fifty, he came to Poitiers and established there what is said to have been the first monastic institution in France; and in 372 he was made Bishop of Tours, about the same time that St. Ambrose was elected to the see of Milan. His diocese appears to have been of wide, perhaps not very definitely limited extent, and Gaul was at that period still an almost pagan country; the cities indeed had been evangelized, but the country folk—the *pagani*—still adhered to their old idolatries. The heathen sacrifices were, however, about this time forbidden by law, and there does not seem to have been much resistance to the edict. Martin, at all events, was very successful in his missionary labours among the people, and persuaded them in many cases to join with him in the destruction of their temples and images. But he was to become yet more conspicuous for his courage in dealing with the usurping Emperor Maximus, and that too as the champion, not of heresy—for he was a zealous preacher of the orthodox faith—but of heretics against that persecuting policy of which Maximus set what Milman calls "a fatal precedent" disowned at the time by the general voice of the Christian Church. Martin had already on first coming to Trèves, where Maximus had established his court, refused to hold any intercourse with him till after his solemn assurance that he had only reluctantly assumed the imperial power imposed on him by the army, and had slain no enemy except on the battle-field. The Emperor seems to have thought that a zeal for orthodoxy, which certainly was not according to knowledge, might help to condone if not to conceal his more than doubtful antecedents, and he thereby gave occasion for the two most distinguished prelates of the day, both afterwards revered as saints, St. Martin himself and St. Ambrose, to pronounce by anticipation an emphatic censure on the evil system so portentously exemplified in the establishment of the Inquisition.

The facts, briefly stated, are these. The Priscillianists, a Spanish sect who had revived some form of Gnostic or Manichean heresy and had been condemned by a local Council under the presidency of Ithacius, contrived to get its sentence reversed by an edict of the Emperor Gratian, and Ithacius had to leave the country in consequence. But after the death of Gratian he promptly repaired to Trèves and appealed to the new Emperor, who summoned the heretics to appear before his tribunal, and in spite of Martin's energetic remonstrances, had them tried and executed after Martin's departure. A solemn protest against these proceedings was entered eventually by Sirenius, then Pope, as well as by St. Ambrose, and Ithacius was deposed and excommunicated. But our immediate concern here is with St. Martin. In the following year he returned to Trèves to intercede with Maximus for two of the officials of the late Emperor Gratian, Narses and Leucadius, who had been threatened with death. He found assembled there a Council of Ithacian bishops, who had already induced the Emperor to send a military commission into Spain charged to detect, arrest, pillage, and kill all heretics, the broad test of heresy adopted being paleness of face and peculiarity of dress. One cannot help being reminded of Louis XIV. and the dragonnades. Martin urgently pressed the Emperor to recall this infamous commission, and meanwhile refused to communicate with the bishops who had procured it. Maximus wavered and prevaricated, but at last, being offended at the pertinacity of his petitioners, ordered Narses and Leucadius to be at once executed. This was too much for Martin's kindness of heart; he hastened at once to the Emperor, and promised to communicate with the persecuting Ithacian faction on condition of the lives of the prisoners being spared and the military inquisitors recalled from Spain. The Emperor granted both requests, and Martin fulfilled his part of the bargain and communicated next day with Ithacius and his associates. For this weakness, as he regarded it, he never forgave himself, nor would he ever again attend any Council or meeting of bishops. But the error, if such it was, does credit to his heart, and we can hardly blame him for preferring the preservation of the lives of the hunted heretics to the logical consistency of maintaining a protest against their persecutors. He died at the age of 81 on November 9, 397, and was buried on the eleventh, the day still dedicated to his memory. His shrine was long a favourite pilgrimage in France, but it was afterwards rifled by the Huguenots, and the splendid cathedral of Tours, one of the finest in France, succumbed, as we have before mentioned, to the iconoclastic fury of the Revolution. The site of his tomb was however rediscovered about twenty years ago under some houses purchased by Cardinal Morlot, then Archbishop of Tours, and a temporary chapel was erected over it, which has become again a place of pilgrimage. In England there is scarcely a town of any size that has not a church dedicated to him, and this may help to explain the retention of his name in the Calendar at the Reformation. For Englishmen generally, however it is chiefly rescued from oblivion by the occasional recurrence of such years as the present, when the question

naturally suggests itself what is meant by St. Martin's summer. And as recent experience proves that even so simple a question may be answered quite wrongly, we have thought our readers might not unreasonably desire to know what is the right answer; the more so as, in spite of his monastic austerities and miraculous achievements, on which there can be no need to dilate here, there is a real human interest and significance in the life of this early saint, who is not inappropriately considered the patron of late summers, and who under a rough exterior concealed so generous and warm a heart.

#### LIFE IN NORTH CORNWALL.

ONE of the few remaining refuges from nineteenth-century bustle, from railroads and telegrams, from traction-engines and steam-ploughs, and from the widely spreading Cockney tongue, is to be found in the extreme West of England, on the other side of the boundary line which divides Cornishmen from Englishmen. Only one railway Company has as yet penetrated into King Arthur's dominion, and thus many places are still something like twenty miles from a station. It is nearly impossible for "up-country" people (as the rest of the world is somewhat contemptuously styled by all who have the good fortune to live west of Exeter) to realize such a state of things; but the results are evident enough in the tenacity with which old habits are clung to, and in the slowness to accept reforms, even of the most unrevolutionary type. Old words and idioms, too, linger in the mouths of the elder folk, though it may be feared that Board-School English will be the language of the next generation, to the exclusion of many a quaint and pithy turn of speech.

Belief in witchcraft is still common, principally in the milder form of "white" witches. There may even be found that traditional personage, the "seventh son of a seventh son," who touches for king's evil, stanches bleeding, and, in fact, is what a South African would call a "medicine-man." Very learned he is probably in woodcraft and bee-keeping, and most other country pursuits; on Sundays a "Methody" preacher, on week days a labourer at twelve shillings a week, living principally on "tatties," and seldom touching meat, save on the great winter festival of killing a pig. He is now a teetotaler after (it is rumoured) a not too sober youth, and his skill in trapping hares and rabbits suggests sundry breaches of the Game Laws in former days, of which, indeed, the old man makes no secret. His whole life has been spent out of doors, and it is not surprising that he should have acquired a certain knowledge of the useful properties of plants, upon which it may be suspected that much of the reputation of the "white witch" is founded, though in some cases the knowledge is of a vague order.

No heart can know, no tongue can tell,  
What virtue lies in the pimpernel,

may be an excellent excuse for not ridding the flower-borders of that pretty little weed the scarlet pimpernel, or "shepherd's clock," but one would like to know something of its positive merits, which the poet has not left on record.

There is a good deal of awe felt of the barrows or tumuli whose great green mounds rise solemn and mysterious in the fields. They are seldom levelled, though most of them have been despoiled of their contents long ago by ardent archaeologists, and their former tenants are popularly supposed to haunt the neighbourhood. Such traditions and superstitions are not confined to the labouring class; the tenant-farmers are equally imbued with them, and indeed can hardly be separated in thought from the labourers, being generally not removed by more than one generation from ploughmen or "horsemen" (i.e. tenders of horses) ancestors. The holdings are very small and the rents low, so that a hard-working man who has managed to put by a few pounds will often take and stock a small farm. If good seasons help him he may add enough to his capital to have something to fall back upon when the hay harvest is ruined by days of soaking rain, or "the fly" decimates the turnip crop, or, worst calamity of all, when the fatal "cawd" or liver disease strikes down his promising flock of sheep. But, on the other hand, should the small farmer be improvident, or, as is too often the case, should his mind be filled with exploded theories of agriculture, woe betide him in such seasons as the country has suffered from in late years. His landlord may overlook the fact that the man has brought a great part of the trouble on himself by his obstinate refusal to take advice, and he may, or rather he certainly will, remit ten or twenty per cent. of the rent; but this is not sufficient to set the poor fellow on his legs again. If he is an honest man he gives up his farm and very likely starts again as a day labourer; if he is dishonest he sells off everything surreptitiously—farm stock, implements, furniture, &c., and "goes scat" (*Anglice*, bolts). The neighbours, if he has any, keep his secret, and it may be several days before the unfortunate landlord becomes aware that the farm is empty. He finds the land probably bearing a plentiful crop of weeds, and the gates, which have been found useful as firewood, conspicuous by their absence; two or three lean hens and a cat representing the live stock. Acts of cruelty to or neglect of animals are exceptional, and, as a rule, the people are fond of their dumb companions, which in consequence are extremely tame, and occasionally even obtrusive in their attentions to timorous strangers. The pig, especially, is in Cornwall, almost as much as in Ireland, an *enfant de la maison*. Long-legged and gaunt, he appears at every farmhouse door, and

his grunt—suspicious, inquisitive, or friendly—greets the approaching visitor. The Cornish pig's intelligence and domesticity have been as much improved by generations of kindly treatment as those of the Arab horse, and he is a far more sociable companion than the mongrel sheep-dog who barks indiscriminately at all strangers. A pig of those parts has been known to follow the family sedately about the grounds, to watch at a gate for the master's coming, and to make a bold, but unsuccessful, attempt to follow the carriage. The wild birds, too, show something of the same fearless and confiding character. Small boys are so few in this thinly-peopled district that they fail to affect appreciably the number of nestlings hatched each year, and the birds, being free from molestation, cease to regard mankind as their natural enemies. Chaffinches boldly come to share the food of the poultry-yard, juncos hardly get out of the way as one walks along the road, and that shyest of woodland birds, the green woodpecker, has been observed for more than a quarter of an hour quietly feeding within a stone's throw of a house, while the domestic pigeons (themselves the tamest of the tame) walked round it at a safe distance, evidently wondering what sort of creature this strangely brilliant visitor could be.

A less pleasant trait of the Cornish character than kindness to animals is that of revenge for injuries, real or supposed. A not uncommon form of vengeance for dismissal from service is the slaughter of the late employer's pig. It is somewhat unpleasant for a "foreigner" (i.e. any one from beyond the border) to know that any offence he may give, however unwittingly, will very likely be revenged in this or some other equally mischievous manner. When a person from any other part of England settles in the West he must be prepared for an unlimited amount of cheating and petty theft, since he will certainly be regarded by some of his new neighbours as a lawful prey. It will take him some time, probably, to understand the dialect. When he hears of "mating" the pig, he may not at first grasp that the animal is to be fed. "Heave" for thaw; "spears," the hazel stakes used in thatching; "reed," straw selected for the same purpose—these and many other words are very puzzling to a stranger. Sometimes, indeed, the better-educated will translate as they go along:—"The weather is very plum (mild) to-day"; and, *à propos* of wasps, "appliedranes, but some folks calls 'em wasp-flies." Planting is always "tilling," and the ordinary square-shaped spade is never used, a long-handled shovel taking its place; but mattocks and an implement called a "flagay" (in Devon a "two-bill") are mostly used for breaking up the ground. The flagay has a very long handle and a double head, axe-edged at one end and mattock-edged at the other. Possibly the slight make of the men may account for the absence of the spade, the use of which requires greater strength than do the implements of the mattock class. A really well-built man is seldom to be seen in the district; though sometimes tall, they are usually narrow-chested, and they would look frail if set side by side with labourers from Yorkshire or Berks. The milder climate of the West may have something to do with the different physique of the inhabitants; unaccustomed as they are to severe winters, any exceptionally cold season tries them terribly. "Plum" weather is what suits them best; moist and warm and (as "up-country" people would say) relaxing; but the westerly winds are charged with the salt spray of the Atlantic, and are untainted by any poisonous vapours of manufactories or stifling fumes of coal smoke; and nothing can be more invigorating than to stand on some rocky headland looking towards the sunset, and there to inhale deep draughts of pure ozone. No harsh chill is in those sea breezes, which are as soft as they are strong, and the most sensitive lungs need not shrink from their contact. It is little wonder if those whose lives have been spent within hearing of the grand Atlantic swell cannot breathe in the bleak air of our Midland and Eastern counties.

Not only by its mild temperature is the winter of the West country robbed of half its proverbial harshness. The bare brown hedges of other counties are there clothed with evergreen ferns, and these, mingled with wreaths of ivy, keep green and fresh till the oak and thorn and beech are bursting into leaf. In the woods the undergrowth of holly and the bright carpet of moss serve the same purpose; and February is barely over before the soft shoots of the honeysuckle appear, and the vividly green wood-sorrel with its starry white flowers, to be soon followed by the "pale primrose" on the roadside bank, the wood anemone under the trees, and the daffodils thickly covering the grass of the orchards. Then we begin to watch for the first blue-bells, and perhaps we may chance to light on the rare white wild hyacinth. The fences are specially attractive in spring, though hardly calculated to fulfil the object of their existence. A low bank, covered with heath or ferns, then on the top some bushes of furze and "besom" (broom), and dog-rose, all overgrown by honeysuckle, a young ash, or oak, or hazel here and there, a few "motes" (stumps) of larger trees from which tufts of polypody or hard fern are springing—such defences as these do not prove very effectual against the inroads of vigorous Devon heifers or obstinate old sheep which never can find their way out of a forbidden field, however easy may have been the entrance and however large the gap. But there is nothing more fascinating than one of these hedges in April, when they are bright with pink campion and white stitchwort, and overflow with primroses; and then in June, when great purple spikes of foxglove rise singly or in clusters, and the dog-roses, white, pink, and crimson, mingle their blossoms with the honeysuckle, and the ox-eyed daisies and long grasses cover the banks, and many different ferns fill the moist and shady nooks—

then, indeed, we forget utility and agriculture, and everything that is ugly and practical, and revel in the luxuriance of colour and freshness that meets us at every turn. Each bit of marsh land bears its crop of yellow iris or white scented orobis or soft cotton grass, and we have not far to seek for the noble fronds of the royal fern which skirts rivers and canals and mill leads.

No one who has spent a spring and early summer in the extreme West of England can think of it with anything but affection; whatever may be the faults of the inhabitants, whatever the drawbacks which attend seclusion from the busy world, still the "West country," with its profusion of natural charms, and the added interest of an as yet unexhausted mine of folklore and folk-language, has a powerful attraction for all who have lived, for however short a time, within the range of that well-nigh magic influence.

#### LIVING AND THRIVING UNDER DEMOCRACY.

THERE is a not inconsiderable party in England, with Mr. Goldwin Smith and Mr. Thomas Hughes at their head, who vigorously defend by word and, where possible, by deed, what the first-named of the two calls a continental policy for North America. This policy appears to be directed to the strengthening of the United States and the weakening of Canada as far as may be. Mr. Hughes, indeed, with the eccentric simplicity which is his characteristic, maintains in effect that it is wicked of Englishmen to emigrate to Canada at all, though we do not know that he has ever put his contention quite so incisively. We cannot attempt here to enter into this quarrel or to decide between the practical agriculturists who say "Try Canada," and the engineers, politicians, professors on the stump, and such-like cattle who say "Try the United States." But it is as well to point out that recent advices from the United States themselves are not exactly favourable to the chances of the emigrant without capital or with only a very moderate supply. On the one hand, the Superintendent of the Employment Bureau at the Immigration Office fears, according to the New York Correspondent of the *Daily News*, that there may be "considerable privation among the immigrants this winter, owing to the inability to find employment for them." "The demand for labour has fallen off materially." "It is becoming difficult to find employment," &c. Now the superior advantages of the United States over Canada have always been considered to be twofold. In the first place, there are the intangible advantages arising from the consideration that in the one it is practically impossible for any given person to be Governor-General, and in the other, theoretically at least, possible for him to become President; while the divine right of "holding your head up" is supposed to be more fully enjoyed to the south of the chain of the lakes than to the north of it. In the second place, there is supposed to be a far larger demand for labour at wages in the States than in Canada. It is tolerably obvious that, if there is no demand for labour or a falling demand in the States, this advantage ceases. Besides, we are not considering so much the comparative advantages of the United States and Canada, as the comparative advantages of the wage-earner in the land of promise, and in this actual land of bondage. A steerage journey across the Atlantic in winter, to be followed only by a sojourn in the sheds of the Immigration Department, does not in itself offer a peculiarly inviting prospect to persons who are tired of what Mr. Gladstone calls this small little island. But there is more information come to hand as to the status of the labourer in America than this general warning of "no demand." The housekeeping expenses of a family in New York are, according to the *St. James's Gazette*, about twenty-five per cent. higher than they were a year ago. Potatoes and apples, the latter a staple food in America, have doubled in price; dairy produce has gone up from twenty-five to fifty per cent.; meat from ten to twenty, flour itself considerably. So that the actual person who is in receipt of wages, though he is certainly better off than the unlucky Johnny Kaw who is looking for employment, is not altogether in clobber. Recent travellers who have returned from the autumn trips to America now common with English members of Parliament have brought tales of numerous English working-men, who, without exactly speaking evil of the land of promise, confessed that the great nominal increase of their income did not seem to bring with it any corresponding increase of comfortable living. That these men themselves will not receive any higher wages this winter, we may be certain, unless the superintendent of the Employment Bureau is singularly wrong in his facts, and they will at the same time have to face either diminished comforts or a seriously increased expenditure.

It would, of course, be in the highest degree illogical to argue that the United States are not a land of promise because they have had seasons now and then. But it is not at all illogical, and may be of not inconsiderable service, to point out that the conditions of life in this unbridled democracy make such alternations of prosperity and adversity peculiarly hard on the Demos. There is hardship enough at home, Heaven knows; but the wind is tempered not a little to the shorn English lamb. In the first place, the working of Free-trade, the comparative absence of rings and corners in the most important articles of commerce, and the enormous number of steady moneyed purchasers, have a tendency to prevent violent fluctuations of price. We had, indeed, some years ago a taste of

American inflation in respect of coals and meat, but that was the consequence of the wild gambling in business to which the fallacious prosperity of Mr. Gladstone's last Administration led. Generally speaking, while things—at least, necessary things—are never suddenly cheap in England, they are also never suddenly dear. Again, as the goings-out are steadier, so are the comings-in. The apparatus for relieving workers who are out of work is multifarious. There are Trade-Unions and Benefit Clubs; there is the vast machinery of the Poor Law; there is the decaying, but still existing, feeling of employers that they must do their best for the employed; and, beyond all this, there is the exhaustless source of private charity, often abused and wrongly drawn on, no doubt, but always ready to stand the draft. In the United States things are different. In the first place, there is next to no machinery for the relief of destitution; and, in the second place, there is no great wish to use it if it existed. The Americans do not like unsuccessful people. Their feeling towards them may perhaps best be illustrated by one of the incredible, but rigidly authenticated, stories which M. Wallon's investigations of the iniquities of another democracy—the first French Republic—have brought to light. Among the persons brought before the Revolutionary Tribunal of Paris was, it is said, a luckless ex-soldier, who had exhibited himself in public places with one leg gone. In doing this, it was urged by his accusers, he had deterred recruits from joining the armies of the Republic by showing them what they might expect. We forget whether he was guillotined or not, though it is most likely that he was; but it does not matter. The point of view is the point of importance, and this point of view is that nobody has any business to be even a temporary failure. One consequence of this is sufficiently well known to all those who have studied recent domestic life in America. The labourer out of work becomes a tramp of the most vicious character, who puts in full practice the old Irish custom of "coohering." Not tolerated in the towns, which are too big for him to meddle with, he roams about the country a terror and a plague to society, occasionally committing frightful crimes, and occasionally receiving his reward at the hands of Judge Lynch. Of course all the failures do not take to the road in this way, but, if they do not, they have no alternative except utter misery and the chance of returning to Europe worse off than they left it. Unless great mistakes have been made, this choice of uncomfortable fates is likely to befall not a few unfortunate persons who have set out this autumn with high hopes for the country where they are to be the social equals of kings and princes, and the material possessors of endless messes of pottinge. The thoughts of such persons do not often get themselves written down, but it may be suspected that they will include not a little hankering after the land of bondage. One of the English phrases which are said to excite most loathing and reprobation in the minds of doctrinaire Yankees is the phrase "upper classes." It would be curious to know whether in the objection there is or is not a latent repudiation of the responsibility which at least all the better members of the English upper classes acknowledge—of the duty of giving a helping hand to those below them. Much has been heard of the public spirit of Americans, and it is certainly praiseworthy; but if all tales are true, it is seldom, if ever, shown in any attempt to help lame dogs over stiles.

There is another side to this question, the discussion of which is, of course, not novel, but which is of very great importance, especially in connexion with the problem interesting to all thoughtful Englishmen just now—the problem of American competition. Will it be possible for American producers to maintain their present immunity from taxation for eleemosynary purposes and for the redress of the sharp alternations of prosperity and adversity which their social and economical condition necessitates? The gloomiest pessimists on the subject of competition always argue as if the American producer was a rentless, rateless, taxless being, equipped by Providence with all necessary conditions for the ruin of Britons. One or two cooler-headed speakers have recently pointed out this error. For the present there is much virgin land still to break up; but the supply is not inexhaustible, as may readily be seen when it is remembered that (as Mr. Walter showed the other day) farmers in America are willing to pay on a kind of Metayer system rent equal to something like twenty shillings an English acre as it is. The comparative absence of anything answering to our direct Imperial taxation is more than made up by the heavy protective tariff and the high cost of labour. The absence of endowments necessitates a considerable expenditure in the form, more or less disguised, of rates—an expenditure fairly to be set against the much-grumbled-at tithe, which is, as every rational person knows, simply rent and nothing more. All this is actual, and we have Mr. Caird's conclusion on it. But the expenditure on Poor-rates which we have hinted at is not actual; it is only impending. For the time America is able to avoid the difficulty which England has long ago had to meet by her Poor-law system, and which Germany is trying to obviate by semi-socialist schemes of national insurance. But she will have to meet it sooner or later. The more she produces and the more she manufactures, the more will labour become master of the situation and the more strongly will it insist on being provided for. When it is provided for, the present hardships which weigh on the wage-earner who is out of luck will be alleviated, but only at the expense of the rest of the community, who, supposing their other burdens to continue as at present, will not be in a particularly enviable condition. For it must be remembered that in America there is no class like the English upper and upper middle class, which can be called upon to

bear the main burden. The famous boast that "every inch of Chicago is covered three inches deep with mortgages" expresses admirably the general character of individual American prosperity. It is emphatically phantasmagoric—a thing of bubbles and of "papor." No doubt there is gradually forming a class of proprietors whose wealth is not dependent on the turn of the tide in Wall Street. But then there is the interesting question whether democracy will let them alone. For the curious thing about this form of polity is that it cannot tolerate anything that is solid. No true democrat seems to have the least objection to a corner making two millions of dollars in an afternoon, probably because every one knows that it is exceedingly probable that the same set of speculators will lose four millions to-morrow. So every citizen has his turn, and it is all pleasant and proper. But a landed estate, let on rents, perhaps entailed and settled—this, whether it be in America or in England, no true democrat can away with. Yet nothing can be more certain than that such estates, and the other fixed and stable fortunes which follow on them, are in effect banks for the lower class to draw upon in time of need, and the only banks which rarely fail to honour the draft. Should Ireland pass through her present stage of convulsion and emerge into a settled condition of peasant proprietors, or low rents and ruined landlords, the misery which will ensue might to a sufficiently ruthless economist be compensated by the instructive state of things resulting. The United States are in a fair way to point a different, but a not less instructive, moral.

#### PENNY DREADFULS.

WE have several times called attention in these columns to certain salient points in the natural history of the modern British rough; we will now say a few words upon one of the principal causes which aid in developing his brutal and ferocious instincts—namely, the literary garbage which is so eagerly devoured by the species, especially in their younger and immature stages of existence. The direct connexion between "Penny Dreadfuls" and crime has been demonstrated over and over again by the annals of our own police courts. The mischievous lad who some time since presented a pistol at Her Majesty's head, and got well whipped for his pains, was found in possession of a collection of lives of celebrated highwaymen; and the various gangs of youthful burglars and would-be highwaymen who have lately appeared in the dock have one and all modelled their career upon the heroes of criminal novels. Only the other day a terrible illustration occurred of the actual effect of this gallow literature upon weak minds. A young man, nineteen years of age, named Westby, shot his father dead at Nottingham, having first murdered a little office boy at the office of the solicitor where he was employed, "merely to strengthen his nerve," and then took refuge in a fowl-house, where he was captured with a revolver in his possession, with which, as he frankly owned, he intended, when the police came, to shoot as many as possible. The key to this otherwise inexplicable outbreak of homicidal fury was afforded by the poor mother's words:—"My son was very fond of reading, and would sit for hours at his favourite amusement, studying periodicals and sensational literature." By this "sensational literature" his habits appear to have been formed, and they were eccentric enough. He would not, we are told, "allow any one to visit his bedroom, which was entered by an opening in the floor. To this opening he had attached a trapdoor, with bolts, and at night he always fastened himself in. He had also pulled down the bedstead, and had been in the habit of sleeping in a hammock slung up from the roof, while around the walls of the room were a number of pictures of the 'Life of Dick Turpin,' &c. A singular collection of cuttings from newspapers was also found in his desk at Mr. Fraser's office, including recipes for the manufacture of gun-cotton and other explosives, together with accounts of marvellous adventures." Here is a direct instance of the effect which the modern substitutes for the *Newgate Calendar* have upon weak intellects and crazy brains.

There has always been a tendency to throw a halo of romance around the outlaw, and many of our greatest writers have sinned in this respect. Sir Walter Scott's glorification of the turbulent marauder, Rob Roy, and Lord Lytton's rehabilitation of Claude Duval are cases in point of mischievous examples which the unscrupulous scribblers who pander to the worst tastes of the public have not been slow to imitate, without, of course, any of the delicacy with which the more eminent hands approach their subjects. Never, perhaps, was this kind of pernicious rubbish more abundant than at present; the facilities for printing, publishing, and advertising having given it a circulation to which the older *Mysteries of London*, *Dick Turpin*, and the like never attained. We need only take a single instance to prove our position, and convince the reader of the mischievous and demoralizing nature of the publications in question.

Australia was infested some little time ago by a gang of ruffians who, under the leadership of one Ned Kelly, took to the bush and committed a series of dastardly murders, impudent robberies, and other outrages which made them the terror of the colony. At last they were encountered by the police whilst attacking a lonely railway station; the ringleader was captured, and nearly all the rest of the band were killed in the fight which ensued. The prisoner was tried at Melbourne and hanged, like the cur he was, shortly afterwards. There was nothing to distinguish Ned Kelly

from hundreds of other bushrangers for which the antipodes are unfortunately famous, except that he and his fellow-criminals accoutred themselves in a rough kind of home-made iron armour, and so proved that they had not even the brute courage with which the ordinary rowdy must be credited. Yet this worthy is made the hero of a work now issuing in penny numbers, and which—although, we are happy to say, no respectable bookseller or newsagent will have anything to do with it—has attained an immense circulation. The motive of the work is sufficiently indicated by quotations from three of our contemporaries which are prefixed by way of motto or advertisement to the book. Every one knows how a single passage, taken apart from its context, can be made to convey an impression quite different from that which the writer intended; and we imagine that the editors of the journals mentioned will not be best pleased at finding their columns quoted in such a connexion. The passages are as follows:—

"It is well known that for many years Ned Kelly had made himself notorious by a series of crimes wholly incompatible with the civilization of the nineteenth century. Ned Kelly's celebrated steed, Maroo Polo, is as well known at the Antipodes as Dick Turpin's Black Bess in these islands."—*Telegraph*, 7th July, 1881.

"It is notorious that the robbery of Mr. Steward's corpse was mainly performed by the assistance of NED KELLY'S BROTHER, the Captain of what was neither more nor less than a pirate ship."—*Times*, July.

"The history of NED KELLY and his celebrated black horse, Maroo Polo, will ever live in the recollection of the Australian public. The deeds of Dick Turpin, and the performances of Black Bess, are tame beside those of 'NED AND HIS NAG'; in addition to which Ned's history is true, and Turpin's is pure fiction."—*Press*, July.

Around this amiable figure the writer has thrown together a disconnected narrative, the sole interest of which consists in the introduction of all the notorious crimes and unsavoury incidents which have disgraced the present generation, and in the exhibition of vice and brutality of the most loathsome and degrading kind. In the first chapter Kelly and his companion throw an unfortunate constable down a "deserted hole" ninety feet deep; but the victim turns up again unharmed a few pages later. It is only fair to say that an explanation is given of this resuscitation, but it is so unpleasant that we are unable to quote it. The unsavoury in all its branches is taught by the instructors of the modern rough, and the nastier the lesson is the more readily and easily is it learnt. A little further on we are introduced to Lola Montez, who happens to be in a coach which is stopped by the bushranger, and at once makes a conquest of him:—

"Lola Montez, Countess of Lansfeldt," said he, "your destiny is to become the wife of Ned Kelly, the King of the Australian bush. The parson shall marry us at once, and then I'll take you right away to your future home in the mountain ranges. What do you say to my plan, countess?"

"That I haven't so much as seen your face. How can I tell whether I shall like you? I have shown you mine; 'tis but fair that I should behold yours in return."

"Well, I don't know but what it is." And the bushranger dropped his reins on his horse's neck, and raised his ponderous iron head-dress.

Hardly had he done so, however, when the beautiful woman (we have her portrait before us whilst we write) pulled a small pistol from within her sleeve and fired it point-blank at the bushranger's face, accompanying the action with the contemptuous remark—

"Where seven men sit panic-stricken before a single villain, 'tis time for a woman to show what she can do."

Unfortunately, the beautiful specimen of the sex in question had not done nearly so much as she intended.

The little bullet from her almost toy weapon, instead of penetrating to the bushranger's brain, had only shorn off a portion of his left ear.

After a dreary list of brutal murders and robberies, which no doubt the literary rough finds very entertaining, we come across another old friend—namely, Mr. Slade, already made famous by Mark Twain, whose chief claim upon the admiration of the public is that he induced a coach-driver with whom he had a dispute to throw away his revolver, and then shot the unarmed man dead. The next hundred pages or so do not contain any passage which we could quote without outraging propriety; but in chapter six we meet with another familiar character, "the unfortunate nobleman who now languishes" in captivity, and who hails from Wapping and Waggia Wagga. Mr. Peace, the protean burglar, next comes upon the scene, and gives a most instructive account of his life and methods of business procedure. As this ingenious gentleman now reposes within the precincts of the gaol in which he was last confined, and files of newspapers are not, as a rule, accessible to the modern rough, the burglarious fraternity should owe the London Novelette Company much thanks for reproducing this piece of professional biography. We have no hesitation in saying that the life of *Ned Kelly, the Ironclad Bushranger*, is as disgraceful and disgusting a production as has ever been printed. Lord Campbell's Act recognized the moral mischief which might be done by publications which offend against common decency, and provided for the condign punishment of the scoundrels who write, print, and sell them. The immoral effect of these stories of bloodshed and crime is worse than that of works which appeal only to the senses. They are, as the annals of the police courts prove every day, direct incentives to murder and robbery; and if the law as it stands is not sufficient to reach those who provide this mischievous rubbish, it is high time that there should be some such amendment of the existing Acts for the suppression of vice as would make it penal to issue similar publications for the future.

We are not sure that the "Penny Dreadfuls" are the only offenders against good taste and public morality in this respect. Many of the penny periodicals which are published for the delectation of youth contain stories which, if not exactly sinning in the same way as those which we have mentioned, are yet too full

of the "marvellous adventures" which had no end and a result in the case of the Nottingham murderer, and too highly spiced with incidents of crime to be altogether wholesome reading for boys. The practice also of giving publicity in the columns of the daily newspapers to the fullest details of dreadful crimes, not only panders to a morbid taste, but actually leads to imitation. The more horrible a murder, or the more ingenious a robbery, the more sure is it to be repeated. We turn away with indignation from the coarsely realistic pictorial representations of murders and suicides in the *Police News* which occasionally catch our eye in passing by some small newspaper shop; but we forget, as a rule, that we have carefully studied the same details in the daily paper over our breakfast. There is room for much improvement in the method of reporting criminal trials; but we can scarcely hope for this until public taste has undergone a change for the better; and this, it may be hoped, will come with the spread of education and culture. The more flagrant abuses to which we have referred admit of more drastic remedies, and we trust that means may soon be found for applying them. Parliament has plenty of work before it; but we should imagine that there would be little difficulty in passing an Act for the suppression of "Penny Dreadfuls," if some member would only bring in a Bill. That such an enactment is urgently wanted, the slight sketch which we have given sufficiently shows; but a searching inquiry into the subject would prove it to demonstration.

#### SMALL-POX HOSPITALS.

THE appointment of a Royal Commission to consider the extent and nature of the hospital accommodation for infectious diseases which now exists, or ought to be provided, for London and the suburbs, ends for the present a highly inconvenient controversy. There are enough obstacles to the prompt and adequate treatment of this class of cases without the number being increased by disputes whether patients belonging to one parish can lawfully be sent for cure to another. The Hampstead and Fulham cases have so embittered the relations between the Managers of the Metropolitan Asylums Board and the district authorities that any profitable, or even peaceful, discussion of the question had become impossible. Consequently the President of the Local Government Board had to choose between deciding the issue for himself and obtaining fresh advice on the subject. Wisely, perhaps, his choice has fallen on the latter alternative. A Royal Commission is to inquire into the whole question, being guided therein by perhaps the very longest instructions ever provided for such bodies. There is nothing connected with hospitals of this particular class which is not mentioned in the instructions, and most of them are mentioned twice over. The gist of the inquiry lies in the second paragraph of the directions given to the Commissioners. They are to consider "the relative advantages and disadvantages of providing for small-pox and fever cases by a limited number of hospitals under one authority, or by parochial and district hospitals." The medical eminence of several of the Commissioners is a sufficient guarantee that their Report will put the Government and the public in possession of all that the latest and most accurate investigation has to say upon this question. We shall know whether cases of infectious disease can be best treated in small hospitals or in large; whether the proportion of recoveries to cases is greatest when the conditions in which the patient is placed are most near to or most removed from those with which he is familiar in his own home; and whether the spread of disease is averted or promoted by the aggregation of many patients into one building. Even when we know all that is to be known upon these points, the controversy may still rage upon the degree in which these considerations ought exclusively to determine the action of the Local Government Board. Let it be supposed, for example, that the Commissioners report that the system under which a few large hospitals are set up in the outskirts of London, to which patients are to be carried from all parts of the metropolitan district, is likely to yield a larger percentage of recoveries than the system under which each parish provides accommodation for its own sick—will that be a conclusive reason for preferring the former alternative? No doubt, if the balance was very greatly in favour of a few large hospitals, if it should be shown that patients recover more surely, and that infection is less likely to spread, when they are brought together than when they are scattered, the feeling in favour of aggregation would become very strong. Even then, however, it might not be irresistible. Those who have the charge of patients ordinarily prefer to send them somewhere else to be nursed. That is only another way of saying that it is pleasant to get troublesome obligations transferred from your own shoulders to those of other people. But then these other people have a voice in the matter; and, if they are unwilling to accept the obligations it is proposed to thrust upon them, the merits of the argument in favour of their doing so become of less moment. This is just how the case stands between the Metropolitan Asylums Board and the district authorities. The Board contends that small-pox and fever patients are more successfully treated; and that the risk of their communicating the disease to others is better guarded against, when the patients are brought together in a few large hospitals. The district authorities, on the least, those within whose jurisdiction

It is proposed to place the hospitals in question—reply that, whether the medical argument on which the Board relies holds water or not, they are not willing to sacrifice themselves for the good of all London. Hampstead or Fulham is willing to look after its own small-pox or fever cases; but it objects to having to look after the small-pox or fever cases of Marylebone or St. Pancras as well. When the Board urges that patients from Marylebone or St. Pancras will have a better chance of recovery if they are brought to Hampstead or Fulham, and that the spread of the disease in Marylebone or St. Pancras will be thereby prevented, Hampstead or Fulham answers that this may seem a very good reason to Marylebone or St. Pancras, but that as regards Hampstead or Fulham it has no force at all. If the Commissioners report in favour of the aggregation of patients, the acceptance of their report will mainly depend on the extent of the good which they attribute to aggregation. If the proportion between cases and cures is markedly greater when the patients are brought together in a few hospitals than when they are scattered over many, and if by this means London is in a great degree ensured against the return of such epidemics, it is not likely either that the inhabitants of Hampstead or Fulham would maintain their resistance any longer, or that, if they did maintain it, they would be supported either by the Government or by Parliament. If, on the other hand, the superiority of one method of treatment over the other is very slight, it is probable that the inhabitants of Hampstead or Fulham will continue to object to an advantage, so slight in itself, being realized at their cost, and there would be so much reason in this objection that it would probably be sustained by the Local Government Board.

It is difficult to see how any argument which proves that the public are better protected against infection when small-pox or fever cases are brought together in a few large hospitals can fail to prove at the same time that the neighbourhood in which they are brought together suffers by their presence. Why are small-pox or fever patients a source of danger to the parish in which they are living? Because they are so many centres from which disease may conceivably be communicated. But, then, will they not be so many additional centres from which disease may conceivably be communicated when they get to the district in which the hospital stands? If this is so, the loss to one part of London must be set against the gain to another, and the parishes which have to bear the loss may not unnaturally object to the vicarious suffering imposed on them by the Metropolitan Asylums Board. What the public at large will ask is, whether the gain to London generally decidedly outweighs the injury done to the parish in which the hospital stands. If it does, they will be inclined to argue that the case is one in which the few must give way to the many. The reason why there has been so little disposition on the part of the victims of the Metropolitan Asylums Board to put up with their fate is that the few have not been called upon to yield to the many, but to the fewer still. The real, as well as the nominal, plaintiffs in the Hampstead and Fulham cases have not been the small-pox patients of London, but the managers of the Asylums Board. It was their outraged dignity that needed vindication. It is probable, indeed, that, even if the managers of the Asylums Board had not magnified their office so unblushingly, the people of Hampstead and Fulham would have objected to receive small-pox patients from other parishes. But the contention between them would not have been so sharp, and there would not have been the same amount of ill-feeling evolved in the course of it. If the managers had been wise, they would have admitted that it is human to dislike having small-pox patients foisted upon you from a distance. They would have condescended to reason where, as it was, they only thought fit to bluster. The great advantage of the reference of the whole matter to a Royal Commission is that it lifts the issue out of the slough of personal and official irritation into which it had fallen, and promises to place it on the solid ground of medical science. After all, the one thing that Londoners as a body want to know is what, taking all the circumstances of London into account, is the best method of dealing with infectious disease—the most certain to cure it, the least likely to spread it.

#### THE TRIMOLET COLLECTION AT DIJON.

ONE great distinction between an average English town and a Continental one of the same pretensions is that, whereas in France or in Belgium, for example, nearly every place has its little museum of natural history and antiquities, and portraits of local celebrities, such a collection is very rarely to be found among ourselves. There are many good reasons to account for this. The destruction of our own abbeys and their churches, with their ornaments and fittings, was complete; and it happened so long ago that the artistic value of every fragment of mediæval art was not yet appreciated. But in France, in particular, the excesses of the great Revolution not only spared many an ancient church, which has done duty since—as at Langres—for a local museum, but provided from the spoil an ample supply of treasures for stocking it with a collection of specimens and relics. Then, again, the Gallo-Roman remains in many parts of France are so numerous that it is a rare thing to find a museum in a small country town without some interesting architectural or sculptural fragments of the Roman period. Our own provincial museums are, we fear, but seldom visited by strangers, though they no doubt are of

appreciable use in advancing the general culture, and perhaps in giving point to the aspirations of some few students in the towns in which they are placed. Sometimes, as in the Dover Museum, for example, there are really good collections of the birds, or insects, or geological specimens of the neighbourhood. And Dover, as a Roman station, actually boasts of a few specimens of Roman art, besides, as becomes a seaport, many shells, war clubs, and other curiosities brought home from distant climes by returning ships. We doubt whether the French local museums are now often visited by travellers, especially if they lie out of the reach of railways. Yet they will generally repay inspection. We have often wondered at the vast aggregate of works of mediæval art still preserved in the "Treasures" of the French cathedrals and in the local museums. The priceless collection of the Cluny Museum in Paris has its representative on a small scale in many a small French town. But our English country towns have nothing to remind their inhabitants of what is to be found on so large a scale in the great central storehouse of the South Kensington Museum. And this is the justification for the project of opening temporary loan museums of ancient or mediæval art in different parts of the country.

Dijon is a place at which so many travellers stop for at least a night when hurrying to or from the Riviera that its local Museum has never been quite forgotten by English tourists. There are few of our readers who do not know that the old Palace of the Dukes of Burgundy, itself a very interesting specimen of fifteenth-century architecture, is now used as the Hôtel de Ville, and contains, in a large suite of rooms, one of the most important museums in France. It boasts of a really large collection of paintings, though none are of very great value, besides many most beautiful and interesting fragments from the destroyed churches of the city and district. In particular will be remembered the magnificent tombs, carefully restored and gorgeously coloured, with the recumbent effigies of Philippe le Hardi and Jean Sans Peur, Dukes of Burgundy, and Margaret of Bavaria, the wife of the latter. Nor must the separate Musée des Antiquités de la Côte-d'Or, added some fifteen years ago, be forgotten.

This Museum has very lately received a further most valuable and important addition to its contents in the shape of the Trimolet Collection. M. Anthelme Trimolet, a painter by profession, a native and resident of Lyons, had spent his life and his fortune, which must have been considerable, in forming a miscellaneous collection of antiquities and works of art of every imaginable kind. Born early in the present century, he had singular facilities for picking up valuable relics of mediæval workmanship before the revival of the general fashion for such objects which has so vastly enhanced their price. And, being childless, he seems to have had ample means at his disposal for indulging his taste. Some quarrel with the municipality of Lyons caused him to remove his home and his treasures to Dijon. And when he died he left all his collections to his wife for her lifetime, with a reversion to the Dijon Museum. Mme. Trimolet herself died last year, and the whole of her husband's collection, amounting to some four thousand articles, has been now for about six months displayed to the public in five large apartments of the Museum. It is not yet provided with a catalogue, though we believe that the Curators are at work on one. Until this is completed, the collection is not of much practical usefulness to the world of students or connoisseurs. But it may be well to give some general account of its contents. There is, we believe, no single department of mediæval art which is not richly represented in M. Trimolet's Collection. The possession of such a treasure will be of great advantage to the old Burgundian capital; and many travellers will make a point of breaking their journey at Dijon in order to visit it.

We scarcely know where to begin in our description of the collection. In oil-paintings it is fairly rich, though few of the specimens are of a high order. Yet there are some of interest, both old and modern; in particular, an unnamed Dutch picture of the *Flagellation*. The whole furniture of M. Trimolet's house, including the portraits of himself and his wife, forms part of his munificent legacy. In addition to which two very interesting bas-reliefs of himself and Mme. Trimolet, dated respectively 1838 and 1833, will hand down their portraits as public benefactors. Sculpture, again, is not strongly represented. But there is one small head of the Blessed Virgin in low relief, of the Christian school of Florentine sculpture, which is particularly beautiful. It might be a work of Verrocchio or of one of his contemporaries. There are several cases of miniatures, and not a few exquisite illuminations from church service-books, some of them framed. And there are several specimens of coloured wax portraits, extremely lifelike and most delicately modelled. Next in order we will notice the ivories. These are very numerous, both secular and religious in design. Among the specimens of this department of art are some early diptychs and several triptychs of the best date, exquisitely sculptured. One of the latter, of considerable size, and square in shape, contains figures of the Blessed Virgin and Holy Child, with small groups of sacred subjects. The whole of this is parcel gilt and coloured with great delicacy. On the outside leaves is this legend:—"Ave maris stella: Dei mater alma: Atque semper virgo: Felix celi porta: Sumens illud Ave: Gabriella ore: Funda nos in pace: Mutans Eve nomen." Horns covered with carvings and toothed-combs must be mentioned in this group. Of stained glass there is but little; though there are a few fair specimens of enamelled painted subjects on a small scale.

The metal-work, on the other hand, is superb. There are all kinds of swords, lances, maces, halberds, spurs, suits of armour,

coats of chain mail, helmets, and shields; together with matchlocks, pistols, powder-flasks, and other details of military accoutrement. We are reminded by this brave show that the late Mr. William Burges, who, like M. Trimolet, was an enthusiastic collector, made arms and armour his specialty. His almost unrivalled collection was left by him, at his recent most lamented death, to the British Museum. Domestic ironwork is represented at Dijon by locks and keys, knives and spoons, mirrors and candlesticks. Lamps and inkstands of bronze may be mentioned next. One pair of altar-candlesticks in latten is of great antiquity. The collection is rich in ormolu and enamels. Limoges enamels abound, with rare Italian enamels, and splendid Italian nielli. Two beautiful plaques, in niello, representing the Triumph of Mars and Mutius Scaevola burning his right hand, ascribed to Peregrini of Cesena (of fifteenth-century date), deserve particular mention. One cloisonné enamel, of very early date, represents the Apostle of the Gentiles, and is inscribed "Sanctus Prædicator." Next, there are settings of jewels and of miniatures in metal. One coffer, in steel, most elaborately wrought, is beyond praise. Add to these innumerable rings, chains, lockets, ear-rings, necklaces, rosaries, crosses (pectoral and processional), morses of copes, croziers, pastoral staves, oagularies, monstrances, reliquaries, chalices, pyxes, and cups and vessels of all shapes and sizes. Then, again, there is a large assemblage of medallions and of coins, in gold and silver, of modern as well as of ancient mintage—especially of Greek and Roman art. Clocks and watches, caskets and cabinets, compasses, and a host of miscellaneous articles, complete the enumeration of the specimens of metallurgic art.

Precious stones may be taken next. M. Trimolet had acquired innumerable gems of all sorts—cameos, intaglios, and carved crystals. There are also cases of the most delicate Venetian glass; with specimens of iridescent glass from ancient tombs; and mirrors of all kinds. Ceramic art is even better represented. There are precious vases of real crackle, Oriental pots and jars, Japanese pottery, and some valuable specimens of Sèvres and Dresden. Faience of all kinds, majolica plates, and fine works of Palissy were must not be forgotten. Textile art, too, is well represented. There are tapestries, and numerous embroidered vestments, purses, and the like.

Finally, there are some very fine engravings; etchings by Albert Dürer, in finest condition, and others by Martin Schön and other masters. A fine engraving of St. Cecilia is described as the first work of Mark Antony Raymond. Wood-work is represented by delicate boxwood carvings, jewel caskets, collars, and cabinets of every shape and material, picture-frames, sideboards, chairs, and miscellaneous furniture. And there are other valuable articles, not easily to be classified, such as mosaics, cocoa-nuts in metal settings, specimens of Egyptian and Oriental personal ornaments, necklaces of Roman coins, and the like.

This enumeration, which is probably far from complete, will show how marvellous a collection is that with which M. Trimolet's legacy has enriched the Dijon Museum. We are not aware whether there is any stipulation that the collection should be kept undivided. One is tempted to grudge so splendid a gift to a small provincial capital. At any rate, the people of Dijon will be benefited indirectly as well as directly by the possession of a collection which, when it is better known and properly catalogued, will doubtless attract very many visitors to their town.

#### THE THEATRICAL LIBEL CASE.

THE history of the action of Scott v. Sampson has perhaps more interest, except, of course, to the parties concerned, in its side issues than in the main one. The character of the libel upon which the action was brought was such that, so soon as the line of the defence became apparent, there could be scarcely a doubt as to the way in which the verdict would go; and the only question which remained open was that of the amount which would be given in damages. The libel appeared in a paper of which the defendant was described in the statement of claim as being "proprietor, printer, and publisher." The gist of the libel, which appeared soon after the purport of the will of the late Miss Neilson, the actress, had been made known, was, as set forth in the statement of claim, this:—"It is just as generally known as that Miss Neilson lived and died that, when her will was opened, it was found that 1,000*l.* was left to Mr. Joseph Knight, a critic, who had in her early days been kind and useful to her, and that the bulk of her property was to go to another old friend, Admiral Carr Glyn. . . . Another theatrical critic [meaning the plaintiff] whose name had not been mentioned in the will, called upon Admiral Carr Glyn and hinted at a great many terrible things about Miss Neilson; that he felt very much hurt, after all he had done, that his name should have been omitted, and that of course he should not do anything objectionable, but, &c. &c. &c.—as any one who understands what such a creature would say can fill in for himself. The result was that Admiral Carr Glyn paid this representative of English journalism 500*l.* in kind or coin." Then followed a letter from the plaintiff's solicitors giving notice of action, in which it was said that "the libel is of a most serious character, and imputes conduct to Mr. Scott which, if true, would justify its terms. You have omitted his name, but it is too clear to him and to us that he is the person intended by the libel." This was, in fact, admitted by defendant's

counsel when the case came before the Court, and justification was pleaded. It is sufficiently obvious that, to support such a plea, it was necessary to prove the alleged facts up to the very hilt. This the defence was quite unable to do, and, in fact, the line adopted was rather that suggested by the interrogatories administered in the course of the action to the plaintiff, "which went into prior matters in his life." It is this, amongst other things, which in this case seems to us of some general importance; but, before we go into these matters, it may be convenient to give a sketch, as briefly as possible, of the general course and conduct of the case. Admiral Carr Glyn, called for the plaintiff, gave an account of a transaction between himself and the plaintiff, whom he had known for some years, the result of which was that he advanced to Mr. Scott 500*l.*, at 5 per cent., to help the fortunes of *The Theatre*, a dramatic magazine conducted by Mr. Scott. In cross-examination he denied that the transaction had any sort of reference to Miss Neilson and her will. At the end of the Admiral's evidence, "This," to quote the *Times* report, "said Mr. Russell, was the plaintiff's case; but he would call Mr. Scott to be cross-examined by Mr. Willis. Mr. Willis, however, said he would call Mr. Scott as his witness."

It is here desirable to point out that neither the plaintiff nor the Admiral was asked by the counsel for the defence whether it was true, as alleged in the libel, that the plaintiff "had thus extorted money from the Admiral"; and the plaintiff, when asked the question by his own counsel, replied that it was a scandalous falsehood. In fact, as we have hinted, the line taken was in great measure that of trying to throw discredit upon the plaintiff generally, without special reference to the libel complained of. This line, as Lord Coleridge most justly pointed out, is open to every conceivable objection. It is a line which in certain cases, and on a greater scale, has been too often attempted, and too often permitted. It may be well to quote what was said in this connexion, or rather specially in connexion with the interrogatories by the plaintiff's counsel in his opening speech. "The interrogatories which had been administered to the plaintiff were, he made bold to say, a positive abuse of the process of that Court. . . . Those interrogatories sought to rake up the story of Mr. Scott's life in all its relations. With what object? Why, to terrorize the plaintiff. To hold up a warning finger to Mr. Scott, the defendant saying, 'I may have libelled you, atrociously, malignantly, but there are chapters in your history to which you would rather keep closed from the world. . . . I tell you, if you come into a court of justice we shall torture you by cross-examination on these matters, raking up things which may have been forgotten—things which you yourself regret.' He ventured to say that he was only speaking the learned Judge's opinion when he said that nothing could be more atrocious than turning interrogatories to such purpose as that." With these remarks most people will cordially agree; but it is to be observed that, since the ruling in the *Orton* case as regards cross-examination to character, such license has been allowed to counsel that, had the plaintiff been put in the box as his own witness, Lord Coleridge might have found it more difficult than he did find it to put his foot down upon a system which is perhaps calculated rather to defeat than to advance the ends of justice. It is a significant fact that, in this case, the examination of the plaintiff by defendant's counsel has been spoken of in almost every report of the trial as cross-examination. The character of cross-examination, it should be further noted, was imparted to the examination without the formal declaration, usual in such cases, to the effect that the witness was to be treated as hostile. Indeed at one point Lord Coleridge very properly thought it necessary to reprove Mr. Willis for treating, or attempting to treat, the plaintiff, his own witness, as a hostile witness. The gist of the whole matter is, as it seems to us, that, according to recent decisions which have not yet been completely overruled, it is open to any person to libel any other person, and, if an action is brought, to endeavour to elicit in court facts which may or may not be thought discreditable to the plaintiff, but which have no real connexion with the libellous matter specially alleged. This is, in fact, a product of the superstition of *res gesta*, and Lord Coleridge may be heartily congratulated upon having done as much as he has done to put an end to so pernicious a practice. But for previous decisions, as we have hinted, he might have done even more. One may, however, hope that his example may have its effect in future, both upon judges and upon magistrates, and may tend to put a stop to the traffic in blackmail which, there is too much reason to believe, is rife.

It remains for us to add that the plaintiff, who has been more than sufficiently cleared of the vile imputation made against him, has perhaps been ill advised in trying to combine vocations which are really incompatible. He was, according to his own evidence, well known as the dramatic critic of the *Daily Telegraph*, and was also the editor of the dramatic magazine *The Theatre*. In undertaking to hold both these positions he obviously laid himself open to disagreeable attacks. In the particular case which has brought this fact into public notice he has defeated his adversary, but had that adversary been a little more cautious it might have been difficult to defeat him. Without for a moment casting a doubt upon the plaintiff's good faith, it may be said that a writer whose business it is to criticise theatrical performances in a daily paper, and who also conducts a theatrical magazine, exposes himself to misconstruction. It is probable that Mr. Scott has by this time seen the objections to a course which was tolerably certain

sooner or later to lead him into difficulties. It may, indeed, be not unfortunate for him in the end that these difficulties should have been forced upon his notice in a brutal and clumsy manner. It is hardly possible to take leave of the case without mentioning the unseemly attack, made "in the heat of advocacy," by the defendant's upon the plaintiff's counsel. The imputation of *mala fides* was as frankly withdrawn as it was rashly made; but the fact remains that it ought never to have been put forth.

#### THE EXCESS OF IMPORTS OVER EXPORTS.

THE excess of imports over exports is perplexing many people, not all of whom are Protectionists. Because a private person will ruin himself if he spends more than his income, it is assumed that the excess of imports over exports means an expenditure larger than the national income, and therefore an encroachment upon the national savings. But this view is based on an entire misconception of international trade. The imports cannot be strictly compared to the private expenditure of an individual, nor can the exports be compared to his income. A short explanation will make this clear to those who have not given special attention to the subject. When, for example, a merchant exports a cargo of steel rails from Liverpool to New York, the value of the cargo is stated by the exporter's shipping clerk to the officer of Customs at Liverpool. The statement is not necessarily exact, but it is near enough to the truth to pass muster. When the cargo reaches New York, however, the value given by the shipping clerk at Liverpool is increased by the freight, the insurance, and commissions. In other words, the value as stated by the shipping clerk in Liverpool is the price at the place of production, while the price in New York is the price in the ultimate market. Now let us look at the imports. A cargo of wheat or of cotton is exported from New York and imported into Liverpool. At the latter place the value consists of the value declared in New York, plus the freight, plus the commission, and plus the insurance. In other words, the value now is the value at the ultimate market; and it is evident that to compare it with the value at New York would be something like comparing the price of coal at the pit's mouth and in London. Under the circumstances the imports must exceed in value the exports. But, further, the mercantile marine of the United Kingdom greatly exceeds that of any other country—indeed it exceeds the merchant navies of all other countries put together. Not only is the merchant navy of the United Kingdom employed in the trade of the United Kingdom with other countries much larger than the foreign navies employed all added together, but it is largely employed also in trading between those foreign countries themselves. And this greatly predominant British merchant navy has to be paid for the services it performs for foreigners. The freight it earns is paid to a large extent in commodities which are imported into the United Kingdom. Moreover, British investments in all forms abroad yield a very large income, which, to some extent at least, is also sent home in the form of commodities. For generation after generation we have been lending money to other countries in large amounts. With the exception of the United States, France, and Germany, perhaps British investors hold a larger proportion of the debts of foreign countries than even the natives of any of those countries, certainly than any other foreign investors in the world; and all these investments in foreign and colonial bonds yield a large interest, which is, to a considerable extent at least, remitted to England in the form of commodities, and therefore appears amongst the imports. Again, British capital has largely contributed to the construction of railways all over the world. The whole of the railways of India, for instance, have practically been made by British capital. So have the greater part of the railways of all our colonies. So, again, has a large proportion of the railways of the United States; and, generally speaking, British investors have contributed considerably to the construction of the railways of the continent of Europe. All these immense investments in foreign railways likewise yield interest which, to a greater or less extent, is remitted home in the form of commodities, and appears amongst the imports. British investors also have contributed largely to the construction of waterworks and gasworks in foreign cities, and British private traders have invested largely all over the world. Amongst the workers of the nitrate deposits which caused the war between Chili and Peru, British traders are the most energetic and most prominent. British capital has also founded and worked the indigo plantations and tea gardens of India. British capital has largely built the cotton mills of Bombay and the jute mills of Bengal; and, in short, British capital is invested in almost every country in the world where it receives fair protection. This capital receives a return which is sent home more or less in the form of commodities. British officials, again, in India, in the colonies, and in other dependencies of the Crown, remit some part of their savings, either for the education and maintenance of their family or as a provision for the future; while British colonists, having made their fortune and returned home to enjoy it, also draw a large income from abroad. These sums are likewise remitted to some extent in the form of commodities, and appear among the imports. Thus, besides the imports proper—that is to say, the commodities directly imported for trade purposes—a large proportion of the imports is really repayment

for services rendered, or interest yielded upon investments made abroad.

It is objected, however, that, if this be true, the years in which the excess of imports is largest ought to be the most prosperous, but that, on the contrary, the excess of the imports over the exports has been greatest in the years of depression through which we have just passed. This, however, is exactly as it ought to be. In years of active trade there is always going on a large lending of British capital to foreign countries; but in the late depression this system of public loans completely ceased. The general discredit was so great that few countries were able to borrow, and most countries were so distressed that they had not enterprise to borrow, even if they could have done so. Accordingly, the exports from this country were not swelled by foreign loans. When, for example, during the inflation years which followed the Franco-German war, loans were made to all sorts of South American countries, a large proportion of these loans was intended for the construction of railways, and was actually spent in purchasing materials for that purpose. A large loan for the construction of a railway abroad almost necessarily implies an expansion of British exports. The whole of the railways of India have been made by capital raised in England, and by far the largest part of that capital has been expended in the purchase of materials here at home which have been sent out to India for the construction of the lines. Loans made to India, therefore, for the construction of railways have greatly contributed to the expansion of our exports to India, and the same is true of almost all the loans made for the construction of railways, gasworks, waterworks, and the like abroad. When the system of foreign loans came to an end, the exports necessarily fell off; but the previous loans that had been made still existed, and the interest upon them was still due. No doubt in many cases the interest was not paid; but upon the great majority of the loans which had been contracted in this country the interest was paid. And thus, while the imports were being swelled by the payment of interest on previous loans, and by the remittance of profits earned abroad, the exports were diminished by the cessation of foreign lending. Since the depression has come to an end, borrowing for public works abroad has set in again. For example, the various Companies brought out during the past twelve or eighteen months for the working of mines in India has led to the export of instruments for the working of those mines, and has therefore augmented the exports from this country to India. We have also had several American railway loans brought out in this country; and if the present speculative spirit continues, no doubt other loans will continue to appear, and will go to swell the exports from this country. It follows that in a period of depression the exports ought to fall off as a matter of theory, while the decrease in the imports ought to be by no means so great. It is possible, too, that during the late depression there was some calling home of British capital invested abroad. In the raw-material-producing countries, which are the countries in which British investment is usually most profitable, the depression was extreme, and for a while it is probable that the British capital so invested did not return a sufficient interest, and that a portion of it was brought home. If so, it naturally came back in the form of imports. But whether this be so or not, it is quite clear that the excess of the imports over the exports ought to be greatest in the years of the greatest depression.

That the view we are here putting forward is correct very clearly appears from some facts brought out in a letter addressed by Professor Leone Levi to the *Times* of Saturday last. In 1860, as he reminds us, the excess of imports over exports amounted to 40½ millions sterling, or about 23 per cent. In 1870 the excess was nearly 69½ millions, or about 60 per cent. And in 1880 the excess amounted to 122 millions, or over 75 per cent. Thus we have in each ten years a steady and large increase in the excess of the imports over the exports. In the same ten years we have also a large increase in the wealth of the country. In 1860 the gross amount of the property and income assessed to the Income-tax was 335,200,000*l.* In 1870 the same income was assessed at 444,900,000*l.*, being an increase of 109,700,000*l.*, or 32½ per cent. In 1880 the amount assessed to the Income-tax was 578 millions, being again an increase of 133 millions, or 29 per cent. Thus, while the excess of the imports over the exports has been so largely increasing, the wealth of the country has been quite as rapidly increasing. And it is to be remembered that in 1880 the income assessed to the Income-tax does not really represent the whole increase of wealth, for Sir Stafford Northcote during his Chancellorship of the Exchequer considerably extended the exemptions from Income-tax; so that the property now assessed, if assessed upon the old system, would be much larger than that stated by Professor Leone Levi. In those figures we have the clearest proof that it is a mistake to think that an excess of imports over exports implies trenching upon the capital of the country; in fact, an excess of imports over exports in a country like England, which for so long a time has been investing abroad in public funds and in industrial and commercial undertakings, is natural and necessary, unless the country had been unfortunate in its investments and had lost all the money it had lent or sunk abroad.

## CLOSE OF THE RACING SEASON.

SOME years ago the Newmarket Houghton Meeting was considered a chilly affair, to be endured on sufferance, but almost beyond the pale of the regular racing season. In these days, nine or ten later meetings have to be gone through before the flat racing of the year is concluded. During the week that followed the late Houghton Meeting there were two days' racing at Worcester, two at Brighton, two at Lewes, and two at Lincoln; in the following week there were four at Liverpool and two at Alexandra Park; and in the two succeeding weeks there were three days' racing at Shrewsbury, two at Derby, three at Warwick, and four at Manchester, besides some smaller meetings. The few events which formerly took place after the Houghton Meeting used scarcely to be regarded as legitimate racing; but they have a good claim to recognition as regular races in these days, since stakes approaching twenty thousand pounds in value are now run for between the last of the Newmarket meetings and the close of the racing season. It is not only at the end of the season that there is a glut of racing. There are now nearly one hundred and forty race meetings in Great Britain at which flat races are run during the year. Last year more than 240,000*l.* was given to be run for, and the total value of the stakes amounted to 387,909*l.* This sum was probably trifling compared to the amount of money which was lost and won during the season in bets; and there can be no reasonable doubt that several millions sterling change hands annually in Great Britain over races. Thousands of men live by racing. To start with, more than two thousand men and boys must be employed in attending the couple of thousand racehorses which are annually trained in the United Kingdom. Numbers of men, again, are employed in attending to the three thousand brood mares at stud farms exclusively devoted to the breeding of racehorses. In addition to those who are directly concerned with racehorses, there are many hundreds, if not thousands, of men who gain a livelihood from racing by working as officials on racecourses, grand stands, and on the staff or at the printing presses of sporting journals. Lastly, there is the immense crowd of betting men, who live by what is technically called bookmaking. It is not difficult to discover the sources from which the money which supports this large population is derived. The thousands of men directly employed with the horses themselves are paid by owners of racehorses, who hope to regain some portion of their expenditure by their winnings. A very large sum, again, is contributed by simple sightseers, who pay prices varying from five shillings to three guineas for the privilege of seeing a day's racing, exclusive of their railway and other incidental expenses. The bulk of this money is raced for in stakes, while some of it helps to keep racecourses and race-stands in order. But by far the largest amount of the money employed in finding food and other necessaries for those who live by racing comes out of the pockets of the countless horde of backers of horses. There is no need to notice the well-known fact that many men of property gamble away princely fortunes on the Turf, that clerks sometimes rob their masters' tills to pay their racing debts, or that forests of fine timber have to be felled and old family estates sold to clear off the gambling encumbrances of lads scarcely out of their teens; but it may be worth calling attention to the less familiar truth that a large percentage of the entire male population of this country makes a practice of getting rid of a portion of its income by backing racehorses. The bulk of these gamblers do not exactly ruin themselves, but rather throw away their pocket-money, on horse-racing. There are the subalterns in the army, the undergraduates at the Universities, and the "young City gentlemen," who deluge the bookmakers with their pounds, their "fivers," and their "ponies"; there are the merchants and tradesmen who enjoy their quiet but substantial bets, even when they lose their money; and there are the "gentlemen's gentlemen," who put many hundreds sterling into the bookmakers' pockets in pounds and crowns. It is said that there is no class of men fonder of betting on horse-races than servants, and that of these the arch-gamblers are waiters at hotels.

A valuable stud horse was sold to go abroad at the end of the racing season. This was Lord Falmouth's Silvio, which was purchased for 7,000*l.* by the Duke de Castries and the Marquis de St. Sauveur to go to France. Silvio is a very handsome horse, and he has won several important races besides the Derby. Many people may regret his purchase by foreigners; but, good as he is, there are other excellent sires left in this country, and it ought not to be entirely a matter for lamentation when good horses are bought by Continental breeders. Englishmen now spend so much of their time abroad that it is greatly to their own interest when anything happens to improve Continental race-meetings. The races at Paris are in many respects pleasanter than those in England, and the hosts of Englishmen that attend there must surely desire to see horses worth looking at. A day at Longchamps or Chantilly is a pleasant incident in a week's trip to Paris, and a little racing in any part of the Continent makes an agreeable variety after sight-seeing and theatre-going. Another sign that had won the Derby changed hands this month. This was Oremorne, who was sold for 5,400 guineas at the break-up of the stud belonging to the late Mr. Savile. It was generally understood that Mr. Savile had once refused 15,000*l.* for this horse. At the late Mr. Savile's sale, twenty-six thoroughbred mares were sold before Oremorne was brought out, at prices varying from 10 to 1,000 guineas. D'Estournel, whose stock in 1878 won nearly 2,000*l.*, was sold for only 120 guineas; while one of his foals, but

a few months old, went for 200. Last week Robert the Devil was sold for a stud horse. His price is said to have been 8,000*l.*

So much has already been said about the victories of Foxhall and Iroquois during the past season, that the subject is worn threadbare; but it is impossible to look back on the racing year without having a keen recollection of the American successes. It has often been said that among racing men, 1880 will be remembered as "the American year"; but we see no reason why the Americans should not be even more successful in years to come, for this season they only brought two thoroughly good horses to England. It is no disgrace to the British Turf when its races are won by horses of English blood, ridden by English jockeys, and trained in most cases by English trainers, even if those horses were born in a foreign country and belong to foreign owners. Certain people professed to be alarmed when Gladiateur won the Derby sixteen years ago, and prophesied that in future this race would often be won by Frenchmen; but no French horse has won it since 1865, and during a hundred years the Derby has only once been won by France, while during the eighteen years that the Grand Prix de Paris has been in existence, it has been won seven times by English horses. The Americans have had a couple of excellent racehorses in England this year. The question is, how many more are they going to bring over?

The Liverpool Autumn Cup produced a great deal of betting as soon as the weights were published. Prestonpans, the winner of this race last year, was made the first favourite; but after he had been very heavily backed by the public, his owner thought right to scratch him. Valour, the winner of the rich Manchester Cup, was then installed in his place. Valour was only to carry 3 lbs. more than he had carried at Manchester, and the distance was a quarter of a mile shorter. When the Liverpool meeting had fairly begun, he was dethroned in favour of Buchanan, the winner of the Lincolnshire Handicap. Buchanan was now handicapped 15 lbs. more heavily than he had been at Lincoln; but it was thought that he could win under the weight, as he had won the Lincolnshire Handicap in a canter by about ten lengths. When the field of eighteen horses had left the starting-post, the running was made at a great pace by Post Obit, who led for a mile, when Piræus, a 16 to 1 outsider, came to the front, and kept there until the winning-post was passed. A terrible scene presented itself at the distance. Buchanan, the first favourite, was much exhausted by the pace, and he blundered and fell heavily, throwing Macdonald, his jockey, very violently. Macdonald was just struggling up again when Erclidoune, who was immediately behind, dashed against him and struck him to the ground a second time with terrific force. Down came Erclidoune, and his jockey, White, was thrown some distance. When the two jockeys were picked up, it was found that White, though severely shaken, was not seriously injured; but with poor Macdonald it was otherwise. He was a ghastly object, and in less than two days he died. The poor lad had been a very promising jockey. Just a month before his death he had ridden Foxhall, when that horse won the Cesarewitch. This was the most serious accident of the racing season. The number of accidents in flat races is comparatively small, and they very seldom produce such sad results as those just mentioned. Considering that falls occasionally take place when horses are going at full speed, it is wonderful that more jockeys are not killed, especially when the additional danger of being run into by horses that may be following is taken into consideration; but, although there must necessarily be a certain amount of danger in flat racing, we should not have much to say against it if that were its only evil. On the day following that of the Liverpool Cup, half a dozen of the field that had run in that race, including the winner, met again in the Great Lancashire Handicap. They carried much the same weights as those they had carried the previous day, with the exception of Piræus, who had 18 lbs. more on his back than when he won the Liverpool Cup. Valour was the first favourite, Toastmaster and Post Obit were second and third favourites, and 8 to 1 was laid against Piræus; but, after making the running during the greater part of the race, Piræus won very easily by a length. Here was an example of judicious management. Piræus had been kept very quiet all the season, and was handicapped lightly in consequence, and then he won a couple of races together worth over 1,500*l.*, for one of which he started at 16 to 1 and for the other at 8 to 1. It might have been more satisfactory to the general public if horses that had been running regularly throughout the season had won both events. That good horse Petronel won the Queen's Plate very easily by two lengths, beating Victor Emmanuel, Poulet, Mistress of the Robes, and Prestonpans at even weights. With the exception of the sad accident already mentioned, the late Liverpool Meeting was unusually successful. At Shrewsbury Piræus was made a strong favourite for the Great Shropshire Handicap, although his Liverpool victories had earned for him a 10 lbs. penalty. Peter, who had to carry the heavy weight of 9 st. 7 lbs., was the second favourite. Piræus seemed to be winning until he came to the corner of the paddock, when Wallenstein rushed up, and won in a canter by a length. In the Liverpool Cup Piræus had beaten Wallenstein by a length; but at Shrewsbury Wallenstein was meeting Piræus at an advantage of a stone in weight, which effected a reversal in their relative positions. Peter behaved well, for once in his life, but his weight stopped him. The Shrewsbury Cup was won by Spitzbergen, who started first favourite. The weather at

Shrewsbury was not so wretched as it usually is at that meeting. It may be added that at most of the principal race-meetings this season the weather has been fine. We will now dismiss the subject of horse-racing until next spring.

## REVIEWS.

### LIFE AND SPEECHES OF MR. BRIGHT.\*

IF Mr. Smith's work had possessed greater historical interest and greater literary merit, he would have been unfortunate in repeating the story which has been much better told by Mr. John Morley in his *Life of Cobden*. Probably Mr. Smith has ascertained by a previous venture of the same kind that there is a market for compilations from old newspapers relating to eminent politicians. The modern practice of writing biographies of living persons is not to be commended; but neither in his *Life of Mr. Gladstone* nor in his present work has Mr. Smith been guilty of any violation of privacy, or of any indiscreet criticism. Both books are written, or compiled, in a tone of indiscriminate eulogy which is less offensive than the opposite mode of treatment. Among several biographies of Lord Beaconsfield published in his lifetime, by far the most objectionable was a systematic attack on his character illustrated by a hostile narrative of his public career. In such cases, adulation is better than spite; nor would any generous writer undertake the biography of a living person except under the influence of admiration or goodwill. The *Life of Mr. Bright* was even more unnecessary than the corresponding history of Mr. Gladstone. In both cases the facts related were hackneyed and notorious; but Mr. Gladstone is not in the habit, like Mr. Bright, of delivering an autobiography as often as he attends a public meeting. Mr. Bright's speeches have been collected and published by Mr. Thorold Rogers; and Mr. Barnett Smith can only supply a few passages or early speeches which his predecessor intentionally and judiciously omitted. There is perhaps a certain interest in the rudimentary efforts of the great orator, who seems to have been as bitter and intolerant in his early youth as in the height of his powers. His style, as might be expected, improved largely with practice, while his temper has remained the same. No great speaker ever took less trouble to disguise his hatred of his opponents. Mr. Bright appreciates in others the worst qualities of his own oratory. In his latest address to his neighbours at Rochdale he selected for especial praise two speeches by Scotch tenant-farmers who had both in the same words denounced landlords as knaves and fools. It is, of course, not to be expected that his faithful biographer should either dissent from his opinions or criticize his language.

In his frequent enumerations of his own public services Mr. Bright sometimes expresses with evident sincerity the belief that he would personally have been well content to devote his life to the conduct of his own manufacturing business, if he had not been urged by a sense of duty into political agitation. If the opportunity of public life had never been offered, Mr. Bright might perhaps have devoted all his energies to profitable industry; but he would have been haunted by a more or less definite consciousness of the waste of extraordinary faculties. Mute inglorious Miltons, if they anywhere exist, must pass unhappy lives. Demosthenes, like Mr. Bright, inherited a factory; but he is not known to have persuaded himself that the cultivation of his cutlery business would have been as suitable an exercise of his genius as his lifelong struggle with the Macedonian power. Mr. Bright had, fortunately for himself, less formidable enemies to deal with; and, unlike the Greek orator, he has always, except at the time of the Crimean war, been on the winning side. His education, his circumstances, and his interests have determined his opinions, though he may be pardoned for his habitual boast of the wisdom and high principle by which he naturally deems himself to have been guided. There is now no difference of opinion as to the injustice and inexpediency of the Corn Law; but there was never any doubt that it was opposed to the interest of spinners and weavers at Rochdale. Mr. Bright's menacing invectives were almost as efficient as Cobden's economic arguments in promoting the formidable agitation of the League. His great intellectual powers were stimulated to their highest activity by a burning sense of wrong. After forty years Mr. Bright is as indignant as if he were still in the height of the contest with the landowners who imposed and maintained the duty on corn. For the general theory of Free-trade, though his doctrines are perfectly orthodox, he has never displayed any extraordinary enthusiasm. His attachment to the Americans and their institutions has not been affected by their obstinate adherence to Protection. The coincidence in England of the social and political predominance of an aristocratic class with its interest in protective duties accounts for much of his Free-trade zeal. Only a few months ago he exulted over an imaginary description of the Protectionist landlords flying for their lives as he cruelly suggested that the innocent Irish landowners were flying from the terrors of the Land League.

Though Mr. Bright, and in a smaller degree the other leaders of the Land League, made abundant use of menace and vituperation,

the movement was mainly promoted and supported by the middle class. The vast sums which were subscribed for the furtherance of the agitation were regarded by the contributors rather as an investment than as a sacrifice for a public object. Mr. Cobden promised the manufacturers not that wages would be lowered, but that the demand for their products and the prices received would be indefinitely increased when foreign customers were allowed to pay for their purchases in corn. Mr. Bright dwelt by preference on the injustice of Protection, and on the inability of a privileged class to resist the demands of the people; but, like his colleague, he relied largely on the pecuniary resources which seemed to be capable of almost unlimited augmentation. The agitation in which he engaged at a later period for the extension of the franchise was perhaps still more congenial to his taste. The establishment of household suffrage in boroughs was in a great measure attributable to the energy of Mr. Bright. Lord John Russell, when his popularity began to fail, had revived the movement which had formerly raised him to eminence; but the arguments and phrases which in the days of the Reform Bill had elicited a passionate response, sounded as vapid commonplaces when after an interval they were repeated to the contented survivors. A Reform Bill of 1853 was contemptuously suppressed while the public attention was concentrated on the quarrel between Russia and Turkey. In 1860 Mr. Gladstone's financial measures, including Mr. Cobden's French treaty, easily diverted the House of Commons from the consideration of another of Lord John Russell's measures. Lord Palmerston steadily discountenanced constitutional change, though he allowed his defeated rival to propose a succession of little Reform Bills. The absence of opposition in the House of Commons during Lord Palmerston's last Administration resulted in no small degree from the general confidence that, as long as he remained in office, no organic changes would be seriously attempted. Only a few alarmists attached importance to an incidental declaration of Mr. Gladstone's which seemed to imply his conversion to the doctrine of universal suffrage; but it was observed that from that time the Prime Minister, when he was occasionally absent from the House, no longer allowed himself to be represented by the Chancellor of the Exchequer. When, after Lord Palmerston's death, Lord Russell and Mr. Gladstone proposed a moderate extension of the suffrage, Mr. Bright was prepared to accept the compromise; but he may perhaps not have regretted the opportunity of agitation which was afforded by the unconcealed distaste of the Whigs for the Ministerial Bill and by the vigorous opposition of Mr. Lowe. The secession of which the present Duke of Westminster was the nominal leader proved fatal to the Bill, and caused the resignation of the Government; but in the meantime, through the agency of Mr. Bright, the scene of contest had been transferred from the House of Commons to the popular platform. In answer to Mr. Lowe's imprudent challenge, Mr. Bright exhorted the unenfranchised population to display their material force, and even to assemble in the neighbourhood of Westminster for the obvious purpose of intimidating Parliament. The Hyde Park riot in which an obscure demagogue played the principal part was one of the many demonstrations which answered Mr. Bright's passionate appeals. During the succeeding autumn he cultivated and almost created a passion for the extension of the suffrage, which became, in the opinion of all parties, irresistible. Two years before no one had seriously thought of Parliamentary reform, though Lord Russell's practical reminiscences of his youth were regarded with amused indulgence. The change of feeling which followed the defeat of Mr. Gladstone's Bill would perhaps in any case have occurred; but it might have been delayed or temporarily checked if it had not been organized and stimulated by a great agitator, who was also the first of Parliamentary orators. There were rumours that in 1866 and 1867 Mr. Bright had occasionally used language which seemed to indicate hesitation or doubt. He was said to have observed with perfect truth that popular suffrage would be more democratic in England than in other countries, where a much smaller portion of the community lived on weekly wages. He was also believed to have intimated his purpose of abandoning further agitation if household suffrage were once conceded to the boroughs. He certainly assented to the distinction, reproduced in Mr. Gladstone's Bill, between borough and county qualifications. It is possible that the moderate language which was attributed to Mr. Bright may have been apocryphal, and it would be idle to dispute a consistency which represented his lifelong convictions. Mr. Disraeli, under the pressure of a supposed necessity, or in conformity with his own inclination, introduced a Bill guarded by nominal securities, which were summarily eliminated by Mr. Gladstone. The two party chiefs might claim to have shared in the Bill of 1867; but the chief author of the measure, as having promoted the agitation to which the House of Commons yielded, was Mr. Bright. Neither Mr. Disraeli nor Mr. Gladstone would have prevailed over the reluctance of the House of Commons if the pressure from without had not become formidable. At that time Mr. Gladstone had not become a popular agitator.

Mr. Bright's fame will not rest on his achievements or essays in practical legislation. He has proposed a scheme for the better government of India which has not found a supporter among persons of practical experience; nor, indeed, has the plan any second advocate. The division of the country into five or six independent provinces and the abolition of the Viceroyalty seems not to be recommended by any plausible reason. The most obvious effect would be a great increase in the share of administration

\* *The Life and Speeches of the Right Hon. John Bright, M.P.* By George Barnett Smith. Hodder & Stoughton. 1881.

reserved to the Home Government, which would have the task of restraining the encroachments of the local Governments on one another and of generally promoting harmony and uniformity. In Irish affairs Mr. Bright has had the merit of discerning that the difficulties were rather agrarian than political; but among the remedies which he has proposed are the abolition of large estates and the more general application of the Encumbered Estates Act. It is now well known that the largest properties have been most liberally managed; and that purchasers under the Estates Act have been unable to emulate the liberality of the territorial magnates. The scandalous wrong which has been inflicted on the modern holder under a Parliamentary title is perhaps the most disgraceful passage in recent Irish history. Mr. Bright's desire for the institution of small freeholders is better known, but at present there seems to be little chance that the experiment will be tried on a considerable scale. Any subdivision which fell short of the creation of peasant freeholds would only have aggravated existing evils. It cannot be said that Mr. Barnett Smith has thrown any light either on political questions or on Mr. Bright's personal history. Of his style it is sufficient to say that he almost always calls Mr. Bright "the right honourable gentleman," and that "honourable gentlemen" are mentioned as if the title were commonly used, and "learned gentlemen" for the most part with a sneer.

#### MADDEN'S COINS OF THE JEWS.\*

THE coinage of the Jews claims a more general interest than belongs perhaps to any other branch of numismatics, though this interest is of a rather factitious kind. Almost every schoolboy collection of coins includes a false shekel, one of those pieces which seem to be poured upon the world in inexhaustible numbers. Persons a little older than the schoolboy handle the coin with reverence, and speculate whether it may have been actually one among the "thousand pieces of silver" which Abimelech gave to Abraham, or among those other twenty pieces for which Joseph was sold to the Midianitish merchants. It is not so very long since even grave writers upon numismatics discussed questions such as these. It is to be feared that if the general reader knew rather more upon the subject of Jewish coins, his interest in them would abate. He cannot be expected to consider too curiously the difference between italics and roman type in the Authorized Version, or to reflect how much of the significance of the phrase "twenty pieces of silver" is due to the insertion of the word piece. It is natural, therefore, for him to assume that coins were in existence in the days of Abraham and of Joseph. But, unfortunately, that is impossible, seeing that the art of coinage had not been discovered in the days of Abraham and Joseph, nor, for that matter, in the days of David or of Solomon. And as for the coinage of the Jews, it does not begin until such time as the Bible history has ceased. It is in a certain sense of the word apocryphal. There are, therefore, two circumstances which give to Jewish numismatics in their relationship to the general public a factitious character; first, the fact that most of the supposed Jewish coins in the hands of private collectors are false coins, and, secondly, the fact that the great majority of the amateur collectors have a quite erroneous notion touching the antiquity of these pieces.

There will still remain, however, a sufficient number of the experts to give a genuine welcome to Mr. Madden's book, which we may fairly call the most complete treatise upon Jewish coins which has yet appeared in any country. The writer has been long a labourer in this field. In 1864 he published his *History of the Jewish Coinage*, which was practically the first edition of the present work. Since then he has from time to time contributed papers upon this subject to the *Numismatic Chronicle*, the journal devoted to this class of studies. Meanwhile, between the publication of Mr. Madden's first and second editions, other writers who had preceded him have returned to the subject, and he has gained the advantage of comparing his results with theirs. Of these writers the principal have been Signor Cavedoni in Italy, Herr Reichardt in Germany, and M. F. de Saulcy in France; all three writers of high ability and reputation. Mr. Madden not unfrequently indulges in a strain of exultation over the mistakes which he has detected in the writings of his predecessors, and which he emphasizes in his footnotes by marks of exclamation. It would be more becoming to remember that those who come after have always the advantage of being able to avoid many of the errors of their predecessors; while these very errors have in no small degree made smooth the road which they are treading.

The early theory concerning the origin of the Jewish coins, which was proposed forty years ago or more by the Abbé Cavedoni, made them begin at the time of that recovered independence of Judæa which resulted from the successful revolt under the Maccabees. This theory was adopted by Mr. Madden in his *History of the Jewish Coinage*, and he has adhered to it in the present volume. Meanwhile, however, M. de Saulcy had successively put forward two other theories as to the beginning of money in Judæa. According to the one first propounded, the Jewish coinage began just after the threatened destruction of Jerusalem by Alexander the Great, and his subsequent pacification

by means of the mission which was despatched to him headed by the High Priest Jaddua. It is well known how, after the fall of Tyre, Alexander marched towards Jerusalem with the intention of inflicting upon its inhabitants an exemplary punishment on account of their previous refusal to assist him in his recent siege; and how at Sapha he was met by a solemn procession headed by this Jaddua. The High Priest recalled the prophecy of Daniel which seemed to foretell the empire of Alexander; and Alexander recalled to mind a vision which he himself had had, wherein this very Jaddua seemed to appear before him. So, on the basis of this mutual recognition of supernatural favour extended to the other, a peace was made between Alexander and the Jews. According to the theory of De Saulcy, the right of coinage was at that time granted to the latter and by them put in force. This view was accepted by the reviewer of De Saulcy's *Numismatique Judaïque* in the *Revue Numismatique* for 1855, though the writer of that critique does not show himself a great master of the matter in hand. In 1857 the same theory was examined in some detail by Mr. John Evans in the pages of the *Numismatic Chronicle*, and, with some hesitation, was accepted by him also. Nevertheless, it was eventually abandoned by its author, who then proposed to take back the first Jewish coins to the days of the rebuilding of the Temple and of the walls of Jerusalem by Ezra and Nehemiah, shortly after the return of the Jews from captivity. Mr. Madden himself, in some papers communicated to the *Numismatic Chronicle* in 1874, seemed to look upon this view with favour, though he eventually returned to the Maccabean date.

After the thorough sifting which these various theories have received, and the advance which numismatic study has made during the last few years, we have no hesitation in deciding in favour of Abbé Cavedoni's and of Mr. Madden's view. M. F. Lenormant, we notice, who has done so much to establish the study of numismatics upon a wide and scientific basis, has returned to the Maccabean date, though at first he adopted the Ezra date proposed by De Saulcy. And, without attempting in this place to enter into the more technical arguments which affect the question, it will be easy to show how much more satisfactory from the point of view of the general historian is the theory which would make the Jewish coinage begin under Simon Maccabæus.

The pieces about which all this discussion has arisen are the well-known shekels, the class of coin out of all the Jewish series with which the general reader is most likely to have some acquaintance, even though it be only derived from forged imitations of the shekel. On one side the piece bears the representation of a chalice supposed to be one of the holy vessels of the Temple. On the other side is a stalk with three flowers, commonly described as "Aaron's rod that budded." These pieces extend over five years only. They come to an end with the death of Simon Maccabæus, and with them comes to an end the silver coinage of the house of the Maccabees, the Asmonean house. Copper coins, however, were also struck by Simon; and the series in this metal continues throughout the rule of the Asmonean kings, and that of the princes of the Idumæan dynasty, until the outbreak of the First Revolt. Adopting, then, the theory that the first Jewish coins were struck by Simon the Maccabee, we find that the whole coinage of the country forms a continuous series. It is obviously much more natural to find money occurring thus in a series almost unbroken, from Simon the Asmonean to Agrippa the Second the Idumæan, than to find a coinage springing spasmodically into life and again dying out. It should be remembered, too, that the result of recent researches into the origin of coinage in Greece and Lydia (that is to say, the origin of coinage in the world) has tended altogether in the direction of diminishing the number of examples of isolated and spasmodic issues of coins such as might have been cited as parallel instances to the supposed mintage of Jewish shekels under Ezra and Nehemiah. There was, it must be admitted, on any theory a somewhat spasmodic character attaching to the issue of the silver coinages of Judæa. The continuous series of money can only be made out by means of the copper coins. Nevertheless, this use and subsequent disuse of silver money is altogether consistent with the Maccabean theory, and, indeed, affords upon that theory one of the most interesting examples possible of the way in which the coinage of a people is often a sort of epitome of its history.

In the history of the Jews after their return from the captivity in Babylon there were three epochs at which they had won for themselves, by force of arms, an almost complete independence of any neighbouring power, an independence lasting for a longer or shorter time, as the case might be. The first and greatest of these periods of complete national life and true autonomy was that which followed the victories of the Maccabees. Judas Maccabæus began his career when Judæa was groaning under the tyranny of the Seleucid king Antiochus Epiphanes. After the death of Judas, and under the rule of his brother Simon, the Jews obtained the formal recognition of their independence at the hands of Antiochus VII. It was at this moment that appeared the first Jewish coins, which were, as we have said, the silver shekels. This silver coinage disappeared with the death of Simon; but a Jewish silver coinage again arose at the time of the First Jewish Revolt under Vespasian (A.D. 66-7), when the nation once more enjoyed a short-lived freedom. Between the fall of Jerusalem in A.D. 70 and the breaking out of the Second Revolt under Simon Barcochab in A.D. 132, none but Imperial coins were struck in Judæa; but at the outbreak of this revolt a Jewish silver

\* *The International Numismata Orientalia*. Vol. II. *Coins of the Jews*. By Frederic W. Madden, M.R.A.S. Trübner & Co.

coinage once more, and for the last time, appeared. It is obvious that the idea of autonomy is more closely associated with the right of striking coins in the precious metals than with the right of striking only copper coins. We know how Rome almost always withdrew the former right from the Greek cities which she had conquered, but allowed them to retain the latter. Almost within our own days private enterprises, such as, for example, some of the Welsh mining companies, have been permitted to issue a kind of token money in copper, but they would never have been allowed to strike silver or gold. Thus the three series of Jewish silver coins tell an interesting history of their own. It is a curious though purely accidental circumstance that each of the series should have been issued by a Simon—the first by Simon Maccabæus, the second by the priests Simon and Eleasar, the third by Simon Barcochab, “the Son of a Star.”

The coins of Simon Maccabæus differ in other ways than in the metal of the greater number of them from those of his successors. Mr. Madden has not devoted much space to the tracing of the origin of the types of the Jewish coins. And this is a circumstance to be regretted, because of all the subtle testimony to history which is given by coins there is none more valuable than that which is yielded by a comparison of the coin types of various countries; and it is just through the reading of small but expressive signs such as these that numismatics can become so useful a handmaid to history. Nor can the majority of Mr. Madden's readers be expected to have such a familiarity with contemporary classes of coins as would enable them to gather this information unaided. Both the types and the legends of Simon's coins are appropriate to the circumstances in which they were issued. They seem to breathe the national spirit which fostered and encouraged the heroic deeds of the Maccabees. Of the types of the shekel—the chalice and Aaron's rod—we have already spoken. The legends on these coins are “Jerusalem the Holy.” On the copper coins of the same Simon the legend is “The Redemption of Zion.” In the subsequent issues there occurs a change which is expressive of the change in the times. The successor of Simon, John Hyrcanus I., preserved intact the kingdom which he had received, and even extended its boundaries. But he did not keep the enthusiasm of the people up to the same pitch of fever-heat which it had reached under the three great Maccabees, Judas, Jonathan, and Simon; perhaps it would have been impossible to do this. Civil discords, as we know, broke out, and John's reign ended in bloody contests between the Pharisees and the Sadducees. We may well believe that John allowed himself to be more influenced by the neighbouring attraction of Greek manners and culture than his predecessor had been, for at the end of his reign he left the severe national party, the Pharisees, and passed over to their adversaries. The coins of John Hyrcanus seem to reflect the various influences to which the prince himself was subjected. On the obverse these pieces bear the Greek A with the legend beneath it, *Jehokanan Hakkohen Haggadol Veeheber Hagehudim*, “Johanan the High Priest and the Senate of the Jews.” Thus the Hebrew legend asserts the supremacy of the Sanhedrin; but the A on the obverse is the initial of the name of the Seleucid king, Alexander Zebinas, and commemorates an alliance which was made between Alexander and Hyrcanus. On the reverse of these coins are two cornucopias, and this is a device copied from the contemporary Seleucid coins. It first appears, we believe, on the pieces of this same Alexander Zebinas. During the days of John's successor, Judas Aristobulus, the same types continue; but towards the end of the reign of Alexander Jannæus, we have a further evidence of a Grecizing tendency on the part of the Asmonean princes—which, by the way, is also suggested by such names as Aristobulus and Alexander—in the introduction of a complete Greek legend on the reverses of the coins: namely, *ΒΑΣΙΛΕΥΣ ΤΩΝ ΕΒΡΑΙΩΝ*. In the coins of this reign we distinguish, moreover, two Seleucid types, the anchor and the double cornucopia.

With the accession of the Idumæan house the sovereignty really passed away from the Jews. Herod was never acknowledged as a Jew, and though he rebuilt the Temple with great splendour, he defiled it in the eyes of the orthodox by fixing up a brazen eagle in the porch. Moreover, he introduced the circus and various heathenish celebrations. We need not, therefore, be surprised to find that his coins, and those of his successors, are less Jewish and more distinctly Greek in type and legend than even the later coins of the preceding dynasty. Herod introduced the Macedonian shield and helmet upon his money. Most of his successors recurred to the older Seleucid types of the anchor and the cornucopia. The legends on the money of this dynasty are always in Greek.

Among the most interesting of the whole series of Jewish coins are the pieces which were struck during the two revolts. The types of the coins in these two series are frequently repeated, and this circumstance makes it a matter of some difficulty to class them in their proper sequence. It has been already said that in these coins of the revolts a silver issue once more appears. We return, in fact, for a short time to a coinage which is, in the true sense of the word, Jewish, and not, like the preceding issues, only struck in Judæa. The “Year of the Redemption of Israel,” “Deliverance of Zion,” “The Deliverance of Jerusalem,” “Year of the Deliverance of Jerusalem,” are the usual legends, written, of course, in Hebrew, no longer in Greek. The types are the symbolic vine-leaf or bunch of grapes, or a palm-tree, the beautiful gate of the Temple, a lyre or a vase; shortly after the suppression of the First Revolt were issued the well-known “Judæa capta” coins of Vespasian and of Titus.

Mr. Madden has done his work with scholarlike thoroughness, and has produced a book which will, we believe, long remain the *locus classicus* of the subject of Jewish numismatics. Seeing that so much research had to be gone through on the question with which he was directly concerned, we venture to think that he might with advantage have omitted those extra chapters on the “Invention of Coined Money” and on “Writing” with which he prefaces his work. The question of the origin of the Phœnician alphabet has not yet been satisfactorily settled. M. Lenormant has never completed his promised work upon the subject; and we may fairly suppose that he has given up many of the notions with which he started. Mr. Madden, we think, trusts too much to the authority of Lenormant's published writings upon this question.

#### THE LETTERS OF CHARLES DICKENS.\*

THE present volume appears in fulfilment of the promise given in the first issue of the Letters of Dickens to the effect that more letters were forthcoming; and it contains nothing but letters, as the brief narrative of the life of the writer, which accompanied the former collection, was completed in it. The subjects of correspondence, as before, are varied; some are serious and important, others light and playful; while a few seem hardly deserving of the pains that have been taken to preserve them. The letters addressed to Mr. Rusden, Clerk to the House of Parliament in Melbourne, may be taken as representing the same class of correspondence as that addressed to M. de Cerjat, of Lausanne, in the former volumes. Both recipients were at a distance, and discussions and opinions on politics and events occur in them which would not be so suitable if sent to friends separated by a less wide interval of space and time. Dickens and his correspondent at the antipodes never met; but much kindness was shown by Mr. Rusden to the two sons of Dickens who went to Australia, for which he was always grateful.

Some of the best of the letters now printed are those written to Professor Felton, an American friend of Dickens, which have already appeared in the *Atlantic Monthly Magazine*. A vein of pleasantry about oyster-eating is to be found in them, which gives occasion to some of the happiest fun and humorous exaggeration of the author of *Pickwick*. In a letter, dated in 1842, in the month of May—which, by the way, is a month without an *r* in it, and therefore is appropriate for the discussion of the question put—Dickens wrote to know what the oyster-openers do when oysters are not in season—“Do they commit suicide in despair, or wrench open tight drawers and cupboards and hermetically-sealed bottles for practice? Perhaps they are dentists out of the winter season. Who knows?” In another place Mr. Felton is instructed in the story of the once famous Dando, who was known to have eaten twenty dozen at one sitting, and might have eaten forty if his personality and his habit of never paying, which had almost acquired the right of a legal prescription, had not dawned upon the terrified shopman. A graphic account of the death of this heroic glutton is given—in the House of Correction—and how they buried him in the prison-yard, and paved his grave with oyster-shells. A Sam Weller of real life appears in one of the letters which Mr. Felton was so lucky as to get, a sort of groom belonging to Dickens, who, having to announce to his master the approach of an interesting event in his family, adds the philosophic reflection, “Wot a mystery it is! Wot a go is natur!” The serio-comic scene at a funeral, also described for the benefit of the Professor, is irresistibly droll, but must be read at length to be duly enjoyed. In an amusing account of his favourite Broadstairs—“our watering-place”—he says, “Seven miles out are the Goodwin Sands, whence floating lights perpetually wink after dark as if they were carrying on intrigues with the servants”; and the North Foreland lighthouse is called “a severe parsonic light which reproves the young and giddy floaters and stares grimly out upon the sea.”

In a different strain are the letters to Lady Blessington from Italy, in 1844. Dickens had been seeing the amphitheatre at Verona, and makes a good point of the traces of their ring left at one end of the arena by a strolling troop of equestrian performers, who had been there some days before; and looking down from the topmost seat he compares the theatre to “an immense straw hat . . . the rows of seats representing the different plaits of straw, and the arena the inside of the crown.” Venice surpassed expectation; Rome was full of interest; but Naples greatly disappointed Dickens. Yet he writes of Vesuvius that “it burns away in my thoughts, beside the roaring waters of Niagara, and not a splash of the water extinguishes a spark of the fire; but there they go on, tumbling and flaming, night and day, each in its fullest glory.” From Paris, in 1847, he writes of the beautiful actress Rosa Chéri, whom he saw in *Clarissa Harlowe*, and compares her death upon the stage with that of Macready in *King Lear*. He went to see Victor Hugo, and describes his house as “a most extraordinary place, looking like an old curiosity shop, or the property room of some gloomy, vast, old theatre.” His wife was there also, and a little daughter. “Sitting among old armour, and old tapestry, and old coffers, and grim old chairs and tables, and old canopies of state from old palaces, and old golden lions going to play at skittles with ponderous old golden

\* *The Letters of Charles Dickens*. Edited by his Sister-in-law and his Eldest Daughter. Vol. III. 1836 to 1870. London: Chapman & Hall, Limited. 1862.

halla, they made a most romantic show, and looked like a chapter out of one of his own books."

Other letters refer to matters of grave political and social interest, and opinions are given upon very important questions. The writer who described the abuses of the Fleet Prison, who invented the immortal Mrs. Gamp, and who laid bare the iniquities of such schools as Dotheboys Hall, cannot be said to have been without influence in dealing with many then existing abuses. But it must always remain a matter for controversy whether Dickens was more the pioneer or the follower of public opinion in the reforms he ventilated, either in his works of fiction or in more solemn and serious ways. His temperament was certainly not of a kind to qualify him to take a permanent and constant part in public or political life—at any rate, in concert with others. He was too much disposed to stand aloof from, and not to sympathize with, movements in which he did not himself take a leading part. A characteristic instance of this tendency appears in a letter to the late Lord Lytton (then Sir Edward Lytton Bulwer), written from Devonshire Terrace on the famous April 10, 1848. When all London was stirred to the heart, and was making a magnificent display of loyalty and attachment to the cause of order and government, and when all classes were enrolling themselves as extraordinary guardians of the public peace, Dickens could write—"I have not been a special constable myself to-day, thinking there was rather an epidemic in that wise abroad. I walked over and looked at the preparations without any baggage, warrant, or affidavit." And this sneer was launched against a grand exhibition of moral and physical strength, which saved the metropolis and the country at large from the intended commencement of an insurrectionary movement, and which was of important service in restoring confidence to the Governments on the Continent of Europe.

Several of the letters to Sir E. B. Lytton are full of the preparations for acting the play of *Not so Bad as We Seem*, by Dickens and his amateur company, for the benefit of the then newly-projected Guild of Literature and Art. Dickens threw himself into the scheme with all the energy of his nature when interested in what he believed to be a good and righteous cause; and the performances of the play were most successful, as they deserved to be, at Devonshire House, at the Hanover Square Rooms, and at many places out of London. The plan for the regeneration and exaltation of literary workers was believed in enthusiastically by its promoters. It was "entirely to change the status of the literary man in England, and make a revolution in his position, which no Government, no power on earth but his own, could ever effect." Later on, when the play was being performed in the provinces, Dickens writes:—"I sincerely believe we have the ball at our feet, and may throw it up to the very Heaven of Heavens." Alas for the vanity of human wishes, and the non-fulfilment of great expectations! The undertaking that was launched with so much zeal, whether from inherent faults, or from some want of practical wisdom in the councils of its founders, never reached the stage of getting into working order; and it is said that its funds are likely to be applied for the benefit of literary men through other channels, and not altogether under the conditions originally contemplated.

The correspondence with Mr. W. H. Wills is valuable as exhibiting Dickens as an editor in communication with the chief of his staff. His kindly and conscientious desire to do the right thing in the best way is admirably shown, and there are delicious bits of frolic and humour which crop up among the business details. In 1853 the question of national defence for England was much agitated, and how much common sense there is in the remarks of Dickens in reference to some hostile critic of what was being done:—

Surely he cannot be insensible to the fact that military preparations in England at this time means Defence. Woman, says —, means Home, love, children, Mother. Does he not find any protection for these things in a wise and moderate means of defence; and is not the union between these things and these means one of the most natural, significant, and plain in the world?

In a letter to Henry F. Chorley occur some excellent words of advice to speakers and lecturers in public:—"Never let a sentence go for the thousandth part of an instant until the last word is out." And, again:—"A spoken sentence will never run alone in all its life, and is never to be trusted to itself, in its most insignificant member. See it well out—with the voice—and the part of the audience is made surprisingly easier." How much, indeed, might the woes of long-suffering audiences who have to hear speakers pretending to speak, and who cannot speak, be diminished if every one who has ever to lift up his voice in public would pay some little attention towards learning the simple elements for success which require to be remembered! Dickens in his hints to Chorley was not preaching what he did not himself practise, for his voice in acting, and in his public readings, if sometimes a little hard, was always telling, and was distinctly audible in the remotest part of the largest halls.

In his counsels to authors, young or experienced, Dickens was always careful and considerate—to an extent surprising in a man of his many engagements, and who was always doing his own work under heavy pressure. His sympathy with all literary labourers was deep and unfeigned, and he spared no pains in affording assistance when he thought it was wanted and deserved. A letter in 1866 to an anonymous lady should be read by all aspirants to literary fame or employment. He points out the common mistake of supposing that there are impenetrable barriers against so-called "outsiders," and "charmed circles" to which admission

can only be obtained by favour, and adds:—"I know that any one who can write what is suitable to the requirements of my own journal, for instance, is a person I am heartily glad to discover, and do not very often find." He concludes with the wholesome observation, "I do not regard successful fiction as a thing to be achieved in 'leisure moments'; and this is obviously in reply to some suggestion made by his correspondent. One may wonder how much of the stock-in-trade in fiction of the circulating libraries is written in 'leisure moments'; and, on the whole, one may perhaps safely come to the conclusion that much, or most, of it is so written.

Later onwards the remarks on Fechter's acting are valuable contributions to dramatic criticism, although all may not agree with Dickens in thinking that he was equal to Macready in *The Lady of Lyons*, and the observation that there was obviously a great interest in seeing a Frenchman play the part is unworthy of the writer. If it were true, the whole play, in which all the characters are French, and the scene of which is laid in France, would have been better if all the parts had been played by Frenchmen, who would only have been known as such by their sharing Fechter's own imperfect pronunciation of English.

Writing to Mr. Rusdon in 1869, Dickens made a sort of prophecy which is worth quoting at the present time:—

The general feeling in England is a desire to get the Irish Church out of the way of many social reforms. . . . I do not believe myself that agrarian Ireland is to be pacified by any such means, or can have it got out of its mistaken head that the land is of right the peasantry's; and that every man who owns land has stolen it, and is therefore to be shot.

Another prediction made in the same year, of the approaching extinction of the Mormons, although at one time it seemed likely to be verified, now unfortunately appears not to be so certain of fulfilment. The degrading phase of a degenerating civilization which they exhibit still flourishes, nor is it easy to foresee, at this moment, how their pernicious and abominable career can be checked.

#### THE OLD FACTORY.\*

ALTHOUGH Mr. Westall's book would obviously never have been written but for the example set him in *Haworth's*, we have no intention of reproaching him on that account. It needs must be that imitations appear, and when they are readable there is no necessity to be exacting in requiring originality. Now *The Old Factory* is decidedly a readable book. We say "book," because we have our doubts how far it is entitled to be called a novel. In spite of a more than sufficiently common practice to the contrary, a novel is generally supposed to require a plot, or at least a coherent story, and *The Old Factory* is nearly destitute of anything of the kind. There is a story in the three volumes, but it is very far from filling them. It is a common thing enough for the plot of a three-volume novel to prove unable to stretch over all of them; but, as a rule, it is to be found in the first and the beginning of the second; whereas in *The Old Factory* it begins somewhat after the usual place of ending. More than the first half of the work is occupied with preliminaries. We do not remember ever to have come across any book which is written so much on what may be called the method of harking back. That a writer, having drawn us an interesting *mise en scène*, should go back some way to show how it was produced is a thing allowable and warranted by good examples; but he must not do it three times over, as Mr. Westall does. Having given us a picture of the hero about to start for school, he goes back to show us how he came to be going, and then, after the history of various things which happened at the time, goes further back still to show us how the hero ever came to be at all. We conclude that the boy about to go to school must take rank as the hero; for it is his marriage which forms the subject of what plot *The Old Factory* has, and which makes the proper happy ending for the third volume. We decidedly prefer that part of the book which is anterior to the plot. It is full of sketches of the old and evil days of Lancashire weaving, when the new machines were just coming in, to the ruin of the old hand-weavers, and had not yet made the fortune of the new race of masters while improving the condition of their men.

Mr. Westall begins with a description of the home of his hero, Frank Blackthorne. Frank is the son of "a manufacturer of the old school," Adam Blackthorne, a well-drawn and interesting character, whose life, home, and works are described in a fairly vivid manner. But, as the author goes back several chapters further on for the purpose of bringing Adam Blackthorne up to date, we will follow his method, and confine ourselves at present to this stage in the fortunes of the son. Frank has just passed through the not uncommon experience of spending several years at a private school and learning nothing. The author stops to give us an account of this school "of the old sort"; but it contains nothing more remarkable than an indolent master, who woke up at intervals to a sense of his duties, and cased his pupils soundly all round. Allowing for a diminished use of the cane, this sort of school is not so old as Mr. Westall seems to think. However, Frank is now about to start for a new one, which is not destined to prove much more satisfactory, and "Yorkshire Joe" is to take him. This gives Mr. Westall a chance of "doing what he does best—sketch a type of North-country workman, and give a picture of old-world life. Yorkshire Joe is general

\* *The Old Factory: a Lancashire Story.* By William Westall, Author of "Larry Lohengrin," &c. London: Tinsley Brothers. 1881.

handy man in Adam Blackthorne's Old Factory—a wiry Yorkshireman who can turn his hand to nearly anything from driving a cart to mending a wall, who does his work well and with fidelity to his master, but is unable to resist the attractions of a vile compound known as “buttered gin.” Blackthorne trusts him because Joe never drinks anybody's money but his own, and, however drunk, can always bring the cart home. On this occasion, his master thinks he can be trusted to take Frank to school, for his pocket is empty, and only just as much as will cover the necessary expenses is given him for the journey. The journey to the school across a country covered with snow is well described, and the author makes Joe the mouthpiece for little sketches of the pinched and poverty-stricken hand-weavers of the day which have some merit, and, what is far from being the case with much in the *Old Factory*, a direct bearing on the story. Adam Blackthorne is far from being popular in the country. He is a hard man, ruling his workmen with a hand of iron, and eager to welcome the new machinery which the hand-weavers look upon as their natural enemy. It is just in the evil times of the Luddites, and Blackthorne's factory is marked for wrecking. By an accident, the manufacturer is in considerable danger of falling a victim to the hatred of his people before his mill is attacked. In the very second chapter he has thrown a workman out of his house when the man came to ask for certain wages which Blackthorne had confiscated for some dereliction of duty. On the night on which his son has left home the manufacturer has become impatient at Joe's delay in returning, and goes out to look for him. He is seen by “Little Fourteen,” the man he has so roughly got rid of, and immediately pursued by him and several half-drunk companions. The men are resolved on treating him in the manner which still distinguishes Lancashire, and punishing him with their clogs, and although Blackthorne's great strength and coolness enable him to hold his ground, and even to dispose of two of his assailants, he is in serious danger when the belated Joe turns up and saves him. Fortunately for his master, the Yorkshireman has got drunk on a tip given him by Frank's new schoolmaster, and has then slept off his “buttered gin” and “fettled ale” in a barn where he has overheard a body of Luddites arranging to wreck his master's mill. Joe hurries home with the news, and arrives just in the nick of time. The preparations for the attack on the mill, the sketches of the Luddite leaders, Dearden and Grindleton, and the result of the fight at the mill, which is effectively defended by Blackthorne, make some interesting chapters. The meeting of the Luddites and the speech of Long Peter fro' Whitworth make an episode which is considerably better than most of the author's very numerous digressions. The method of defence, however, which Blackthorne adopts at the suggestion of his partner Basel, strikes us as being a trifle fantastic. Dummies dressed up as soldiers, steam-pipes turned into cannon, and the turning on of the water-pipes, would scarcely have frightened the Luddites.

Having consigned Frank to the new private school, where he is to go on learning nothing, unless an efficient spoli for raising the devil be allowed to count as something, and beaten the Luddites off from the Old Factory, the author goes back many years to account for Adam Blackthorne's possession of that building, and to give the history of his wooing and winning of Rachel Orme, his wife. The chapters which are devoted to this form by far the best part of the three volumes. With the help of a little of what precedes them, and the suppression of Mr. Frank's poor love story which follows them, they would make a pleasant little tale of far higher artistic value than the three volumes of *The Old Factory*. The history of Adam Blackthorne is not written either with power or with any considerable originality; but it is an agreeable and credible picture of a stamp of man always common enough in England, but never seen to such perfection as in the North country during the first half of this century. Adam Blackthorne is a thoroughly self-made man. He comes of a strong wholesome stock of yeomen and weavers, all trained to be frugal and laborious, and equally able to drive the plough or the loom. The nature of their work gave them a width of training unknown among the mere handicraftsmen of the great cities of to-day. Their independence gave them a certain pride, infinitely more healthy than the modern class hatred of workmen to employer. Adam finds himself at the age of twenty left penniless by the death of his father. The little property of the family is just enough to secure the widow a small annuity, and Adam is left to push his way in the world with “a pair of stalwart arms and legs conform,” under the guidance of a good clear head, in which a love of money does not interfere with an instinct for doing good work for the work's sake. His hard-earned knowledge of what good weaving is gets him a place as “putter out,” under a Mr. Broome, and his sagacity in checking the weavers' trick of taking spare yarn, known as “mooter,” makes him a valuable servant. On his master's death Adam, acting by the advice of one Paul Dogget, a spinner of the old illiterate stamp who made big fortunes by judicious rule of thumb, starts out as manufacturer on his own account with what little savings he has, and the confidence the spinners have in his brains and integrity. The fight is hard; but, by incessant toil, and doing three times as much with his own hands as any of his men, Adam works his way to success. Like most men who have risen from the ranks, he is hard to his men, thinking his duty to them done when he pays their wages, and not unwilling to back up his hard words with hard blows. When he is fairly on the road to success Adam very naturally marries, and the history of his courtship makes a very

pleasant little idyl. With what is only a very superficial inconsistency with his rough nature, he chooses his wife for her beauty and the charm of her character. The author has very properly connected Blackthorne's one romance with the one element of sentiment and tenderness which softened the rough money-getting Northern life. Rachel Orme is the niece of a shining light of the religious world of Lancashire, one Nancy Cooper, a “painful woman,” much troubled about her soul and the souls of her neighbours, but shrewd in the honest getting of money, and the putting of it out in safe mortgages. The story of the loves of Rachel and Adam is told with feeling and some humour: She has been brought up to believe that all human love is an offence to God, after the manner of many religious sects which look harder and narrower than they are. Her love causes her many tears and searchings of heart. As for Adam, he is troubled with no such doubts, but goes gallantly forward, thrashing a big blacksmith who is rude to Rachel, and enduring many sermons that he may see her and overcome the very probable opposition of Nancy Cooper to her niece's marriage with so worldly a young man. Of course Nancy is conquered, and is finally so far won over by Adam that when, years after his marriage, a chance is offered him of buying “The Old Factory,” she finds the capital and starts him fairly on the road to fortune. A fortunate meeting with a M. Basel, a Swiss chemist, who becomes his partner, does the rest, and Adam becomes a very wealthy man. Here, however, the really meritorious part of the book ends. A woman like Rachel, with her high and earnest sense of duty, and so strong a man as Adam, should have been the parents of a race worthy of them; but, alas! that is very far from being the case. Perhaps it may be Mr. Westall's irony which gave them such children as the weak snob Frank and his selfish sister, who are both mere shadows as compared with their parents; but we fear it is only fatigue and the dreary sense of having to make bricks without straw which comes of the tyrannical law of the three volumes. When we say that M. Basel has a fair daughter, and that there is a designing young person with views on Frank, and a great deal of law for the accuracy of which we should be sorry to vouch, we have said enough to show what the nature of the plot of *The Old Factory* is when the author at last unfortunately gets to it. It is only fair to say, however, that little sketches of Lancashire life, which are what the author is strongest in, are to be found, though in diminished numbers, even to the end.

#### SHAIRP'S ASPECTS OF POETRY.\*

THE somewhat miscellaneous character of these “Aspects” needs no defence to those who are acquainted with the conditions of that curiously regulated Professorship, the Chair of Poetry at Oxford; and Professor Shairp very properly gives the necessary information in his preface to those who do not know them. The Professor holds his office for five years, on the terms of giving one lecture a term. This cannot be said to be a very heavy tax on him, inasmuch as it amounts to but fifteen lectures in all, or twenty if the nominal, instead of the real, number of terms is observed—a point on which we are not certain. But the distribution of the course (if course it may be called) makes it by no means easy to observe anything like continuity in it. It has often been suggested that it would be in every way better if the conditions were altered, say, to the giving of three courses, of eight or ten lectures each, in alternate years, which would give all undergraduates a fair opportunity of listening to the wisdom of the Professor, and would at the same time give the Professor an inducement to attack subjects of bulk and consequence. However, a man can but deal with things as he finds them; and the result has been that for many years the Professorship of Poetry, though it has—especially during Mr. Matthew Arnold's tenure of it—given occasion to many interesting essays and disquisitions of a fragmentary kind, has not produced any one course worthy of the name as a solid and durable contribution of size and weight to English aesthetics. The contents of this volume are made more miscellaneous still by the incorporation of some papers which were not written as Oxford lectures at all, but as ordinary magazine essays. Thus, of the fifteen chapters of which the book consists, five only deal with what may perhaps be considered the most legitimate subject of a Professor of Poetry—the aspects of the art in a general sense. These are respectively entitled “The Province of Poetry,” “Criticism and Creation,” “The Spiritual Side of Poetry,” “The Poet as a Revealer,” and “Poetic Style in Modern English Poetry.” Their general tenor may be anticipated by those who are acquainted with Mr. Shairp's usual attitude towards things poetic. That attitude may perhaps best be defined by saying that it is antagonistic to any strict definition of poetry, that it disposes the Professor to give more attention to matter than to form, and to resist any attempt to analyse the poetic charm. There is no need to enter into the controversies which become almost inevitable when subjects such as this are discussed. Professor Shairp is all the more entitled to state his opinions in that they are by no means the most popular or generally held nowadays, and are equally remote from Mr. Matthew Arnold's rigid limitations of the poet to “life” and “conduct,” and from the material liberty and formal restrictions imposed by the art-for-art school. Speaking generally,

\* *Aspects of Poetry*. By J. C. Shairp. Oxford: Clarendon Press. 1882.

Professor Shairp's criticism of abstract poetry is that of a man who admires Wordsworth and Scott above all other poets, and whose dicta in relation to poetry are seldom free from conscious or unconscious reference to one or other of his favourites.

The miscellaneous essays which follow are, as might perhaps be expected in the case of a critic who takes this point of view, of wider interest. There are two on Mr. Carlyle and Cardinal Newman which have to smuggle themselves in under the sub-title of "Prose Poets," and which might perhaps have been better reserved for a volume devoted, not to poetry, but to the *Belles Lettres* in general. One on Virgil, one on Burns, one on Shelley, two on the Poetry of the Highlands, with special reference to Ossian and Duncan Ban MacIntyre, two on Wordsworth ("The Three Yarrowes" and "The White Doe of Rylstone"), and one on Scott, complete the list. Of these, critically speaking, the essay on Scott is the best, and the essay on Shelley the worst. For it follows, from Professor Shairp's general attitude as to poetry, that he is a capital judge of what he likes, but a bad judge of what he does not like or does not understand. Many foolish things have been said lately about Shelley in the way of exaggerated praise. But the exaggeration which comes from over-appreciation, if it be more tedious, is not likely to go so far wrong as the exaggeration which comes from failure to understand. Much of what Mr. Shairp says about Shelley recalls the amazing statement in his book on Burns, in the *English Men of Letters* series, to the effect that the *Jolly Beggars*, one of the finest things of its kind in English, is "decidedly offensive." Mr. Shairp does not like the morals of Burns, and he does not like the religious opinions of Shelley, and no doubt he could give excellent reasons for disliking both. But, while patriotism almost makes him forgive Burns, no such redeeming influence seems to come in to the help of Shelley, and therefore the judgment delivered is somewhat inadequate. On the other hand, the essay on Scott, though there is some fault to be found with the title, "The Homeric Spirit in Scott," is very satisfactory to read. The writer knows his subject thoroughly; he is enthusiastic about it, and he has the great advantage of speaking on it in succession to some other critics who have not known it and have not been enthusiastic about it. The two essays on Wordsworth would, we fear, be dismissed by Mr. Matthew Arnold as "by a Wordsworthian," and there would be some justice in the attribution. But "The Three Yarrowes," at least, is a capital essay, written from the heart, not without fair assistance on the part of the head. That on Virgil may be recommended as putting the case for a poet who is not a great favourite with some professed critics of poetry, earnestly and without the affectation of language which characterizes another Virgilian essay referred to by Mr. Shairp in rather excessive terms of praise—that of Mr. F. W. H. Myers. As often happens, however, this very excess is interesting, because it shows the object which the eulogist has proposed to himself, though, of course, it shows it quite unconsciously. "The Essay," says Professor Shairp, "is the work of one who has seen more clearly and felt more vividly than others have done the peculiar excellence of Virgil, and who longs to make others see and feel it." This is evidently the standard which the Professor has proposed to himself in his own critical lucubrations. He is hortatory and expository rather than didactic, a preacher rather than a professor.

From this point of view, however, we are inclined to think that the most interesting essays in the book are the pair on Highland Poetry. They have, of course, the great advantage of comparative novelty of subject, and of consequent freedom from the operation of La Bruyère's words, "tout est dit, et l'on vient trop tard." The Ossianic controversy has been buried long enough to make the digging up of its bones not merely an inoffensive, but a positively interesting, archaeological exhibition. Of the minor Gaelic poets few Englishmen know anything, and hardly any Englishmen very much. With the natural unreasonableness of human beings, we are inclined to grumble at Professor Shairp for not having given us more, when it would be more proper to thank him for having given us what he has. The task is one of those for which, as we have said, he is specially qualified. He has knowledge, and he has a patriotic enthusiasm which will always carry a Scotchman—let no one infer that we think Scotch patriotism must necessarily include things Gaelic—further than anything else. Besides, there is something peculiar in the subject-matter which exactly suits Professor Shairp's ideal of poetry. The Gaelic poets of the past do not distract him between admiration of their form and dislike of their matter, as do Shelley, and in part Burns. Their vague romanticism, their descriptions of nature, their simplicity of thought and feeling, are positively attractive to him. Perhaps he is too confident on the subject of Ossian, but that is a very difficult matter to enter upon. If Mr. Shairp himself, with his knowledge of the language, humbly hopes for "a Gaelic Bentley or Porson" to settle the question, how shall critics who do not pretend to acquaintance with that ancient tongue (of which, to use the words of a cautious Gael, Adam "mecht have had a few words," even if he did not talk it exclusively) rush in? The only answer to this is, that the Gaelic Bentleys and Porsons have hitherto agreed to differ so completely that it seems as if the question, after all, were rather one of scholarship in the wider sense than of mere particularist philology. To the discussion of the question in this wider sense Professor Shairp has made a contribution of by no means small importance. His own conclusion is that there is, or was, a body of Ossianic poetry, not necessarily identical,

much less coextensive, with Macpherson's work, which belonged to a "time far back beyond the mediæval age," whether there ever was a single bodily Ossian or not. As to Macpherson's work itself, he seems chiefly to rely on its coincidence of feeling and expression with undoubted work of much greater antiquity. But this argument seems somewhat to overlook the fact that a forger, unless utterly ignorant of his subject (which no one pretends that Macpherson was), would naturally aim at this coincidence.

More interesting still is the essay on Duncan Ban MacIntyre, the Gaelic poet, whose life covered the last three-quarters of the eighteenth century and more than the first decade of this, whose work is unquestionably genuine, of high merit as poetry, and particularly attractive as celebrating the older and more primitive Highland life which was usual before the introduction of large sheep-farming. It is rather comical when one remembers the indignant protests against deer and deer forests which are usual with a certain class of politicians nowadays to find this unprejudiced and simple witness regarding and describing the sheep, and not the deer, as the devastator of the Highlands. When Duncan Ban first knew his beloved Black Mount, the mode of life of the inhabitants of the district seems to have been very much like that of Norwegian peasants. The crofters kept their few sheep and cattle in the valleys during all the year but the height of summer, when they drove them up to *sealers* on the Bens. These, for the greater part of the year, were given up to the deer and the roe, the grouse and the blackcock. According to Duncan, the invasion of the sheep was fatal alike to man and to game, and, more than all, to the wood which clothed the hills. It seems really not impossible that this denudation may have had something to do with the impoverishment of the soil, which is alleged to make a thicker population than at present impossible. But, however this may be, Duncan seems to be a good witness to the effect that grouse and deer were not incompatible with Highlandmen. His chief works, as given here by Mr. Shairp in specimen translations, seem to be rapturous descriptions of the mountains which he haunted (for he was long forester to both the great chieftains of the House of Campbell), of the birds and beasts that inhabited them, the woods and grasses that clothed them, the very winds that blew over them. Nowhere, perhaps, is a simpler, as well as a more enthusiastic, delight in nature to be found; and the poems quoted certainly bear out Mr. Shairp's denunciation of "the modern doctrine that enthusiasm for nature is necessarily a late growth." It is true that no one who possessed the slightest acquaintance with mediæval poetry could hold this view, which is a natural result of continuing poetical study to modern poetry and to the classical languages. Professor Shairp's excursion into Gaelic has provided him with the *tertium quid* necessary to save him from the error.

#### SPORT IN THE CRIMEA AND CAUCASUS.\*

MR. PHILLIPS-WOLLEY'S account of his adventures in the Crimea and Caucasus has merits which are by no means common in sporting narratives. The author has, on the one hand, refrained from attempting too elaborate a style, and never tries fine writing or indulges in the detestable practices of word-painting; and, on the other, he has avoided the affected jocosity, the affected familiarity, the vulgarity, and the slang which so often mark the sporting writer. He tells his story simply, but by no means weakly, and brings the scenes he describes before his readers with a power which might be envied by many of those whose calling it is to give graphic descriptions of places and things. Then, in addition to being well written, his book possesses the supreme and rare merit of truthfulness. From most hunters' narratives it would appear that the writers never miss. The "coons" would always come down to them if they were wise "coons." But Mr. Phillips-Wolley makes no pretence to that deadly skill which, on paper at least, the destroyers of big game always seem to possess. He is not in the least afraid to record that he missed, and sometimes that he missed clean. Few men would have the courage to recount, as he does at p. 102, how he had a really good chance at a wild boar, but did not touch the animal, or, indeed, to speak of several other misses mentioned in the book. But Mr. Phillips-Wolley is evidently bent on avoiding one great vice of travellers, and adhering absolutely to fact, even when it puts him in a rather ludicrous light. Thus in one place he describes very fully how, in the depths of the forest, he shot in the most approved fashion what he imagined to be a splendid wild boar, and then discovered that he had simply slaughtered a large pig belonging to the man he was staying with; in another how, after careful observation, he all but shot his own servant; in another how his dry-plate photography failed so completely as to make him seem woefully foolish in the eyes of the Caucasians, who expected marvellous pictures. These and other anecdotes in which Mr. Phillips-Wolley shows perfect willingness to raise a laugh against himself have the merit of at once amusing the reader and inspiring him with perfect belief in the author; and when he tells of a successful hunting adventure, or of the utter discomfiture of an insolent Russian or Tartar, a pleasant confidence is felt that he is not departing one hair-breadth from the truth.

If, however, Mr. Phillips-Wolley's book is in some respects highly

\* *Sport in the Crimea and Caucasus*. By Clive Phillips-Wolley, F.R.G.S., late British Vice-Consul at Kertch. London: Bentley & Son.

satisfactory and well worth reading, it is in others decidedly disappointing. Considering that he was Vice-Consul at Kertch, his ignorance of the Caucasus is really surprising. He is not even acquainted with the books which have of late been written about it. He mentions Mr. Freshfield, it is true, but only to show that he has not read his book, for he calls it "The Frosty Caucasus," which Shakespearean title belongs to the narrative of travel written by Mr. F. O. Grove. Baron von Thielman's book Mr. Phillips-Wolley does refer to, but it is merely to quote one of the few inaccurate remarks in that generally accurate work. Of Captain Telfer's learned and elaborate work on Transcaucasia and Mr. Grove's book he apparently knows nothing. It is not a little strange that he should have lived comparatively close to the Caucasus, have travelled in the Caucasus, and written about it, without having tried to learn what other travellers had done; and he shows scant respect for readers when he refers to Mr. Freshfield's narrative without having read it. As has been said, he gives it the wrong title, and he speaks of it as if in 1878 it had only been a short time before the world. The *Central Caucasus and Bashan* was published in 1869. By a casual glance apparently at a work which he would have done well to study carefully, Mr. Phillips-Wolley became acquainted with a passage which partly induced him to go to the Caucasus. This was the rather unfortunate passage in which Mr. Freshfield observed that almost the only game he saw in the Caucasus were two tame bears in a Tcherkess village. Mr. Phillips-Wolley determined to go and see for himself what game there was, and he seems to think that he ought to dispel the erroneous impression which Mr. Freshfield's words of twelve years ago were likely to cause. If he had carried his studies beyond one glance at one book, he would have seen that Mr. Grove, who wrote in 1875, was at some pains to draw attention to the opportunities for sport in the Caucasus, and that he spoke of one great forest region at present visited only by a few hunters from the Upper Bakkan, which is probably rich in many kinds of game. To his having read little or nothing about the country he visited is probably due the singular want of enterprise as a traveller of which Mr. Phillips-Wolley's narrative gives evidence. In a sluggish, luxurious, or timid traveller this would not be surprising; but it is surprising in Mr. Phillips-Wolley, who is evidently a man of no common courage and resolution, and nobly indifferent to hardship. Of course his object was sport, and not exploration; but he could easily have combined both, instead of lingering, as he did, on the borders of one of the most interesting countries in the world without making any attempt to penetrate into the interior. Had he taken the trouble to acquire a little more knowledge of it, he probably would have been fired with a traveller's ardour, which he could well have satisfied without in the least neglecting sport, and would have produced a very different record of travel, as he certainly had exceptional opportunities for exploring the great range. Two journeys to it are described in his book, which is at once so pleasing and so deficient. It begins with an account of sport in the Crimea, and near Ekaterinodar, on the Lower Kuban, and the writer then proceeds to tell of a hunting trip to the Caucasus, which he made in 1876. After going to Paman and the town just mentioned, he made his way to Duapse, or Tusape, on the coast of the Black Sea, having on the journey a rather grave adventure, not, indeed, with the wild beasts he had come to slay, but with a creature about on a par with them. He had for awhile a Russian cavalry officer for companion, and this worthy, having drunk too much of that very filthy liquor vodka, thought fit to behave with insolence to the Englishman. Undeterred by the enormous odds against him, in case the servants should take their master's side, Mr. Phillips-Wolley seized the ruffian, and gave him a correction which would probably be best described by the words Mr. Grantley Berkeley loved so well, though Mr. Phillips-Wolley is content euphemistically to call it a "shaking." The Russian was effectually cowed, and his servants made no attempt to molest the formidable Vice-Consul, who went on his way unharmed.

After a short stay at Duapse he sought sport at various places on the coast, finding a fair amount of game, but certainly not more than might be expected considering how few inhabitants there are. It may not be superfluous to point out that Mr. Phillips-Wolley was on the sea-coast of Circassia properly so called, and that it was from this district, and from Abkhazia, which lies to the south of it, that the great deportation of natives took place. A most interesting journey might probably be made from the sea-coast of Circassia across the chain west of Elbruz to the waters of the Upper Kuban and the Karatchai country. Thence the south might be reached by the Nakhar or the Nakra Pass. Abundance of sport would, in all likelihood, be found *en route*. The idea, however, of attempting exploration for which he was so well qualified never seems to have occurred to Mr. Phillips-Wolley. Unable to see anything in the country except its capacity for producing game, he stayed long at one miserable station after another, enduring with stoical cheerfulness discomfort that could hardly be surpassed. He had an exciting adventure with a bear, and wounded once in the dark an animal which he believed to be a leopard. On the whole, however, the sport, though good, does not seem to have been remarkable; and, well as the author writes, the long story of his stay at shooting stations becomes a little tedious. At the beginning of winter he returned to Duapse, and went thence to Ekaterinodar, and from there home to Kertch, where, however, he stopped a very short time, soon taking steamer for Soukhoum, Kaleh, and Poti. At the first-named of these places he was in easy reach of a district which probably contains magnificent hunting grounds. He might have ascended the valley of the Kodori and struck into the

mighty forest which lies between its waters and those of the Upper Ingur, and then have descended from the Ingur Valley, or gone through Swanethia and made his way to Kutais by the Rion Valley. The latter journey would probably have been dangerous; but to such a man as Mr. Phillips-Wolley this would have been an incitement rather than a drawback. In the forest he would have found large game in abundance; but, adventurous sportsman as he was, the idea of making such a journey never seems to have occurred to him, and he was content to travel tranquilly from Soukhoum to Poti on board the steamer, where he encountered a certain Colonel G., who professed to have killed in this Abkhazian country game of all kinds, including the auroch, or wild bull. Now the auroch is the Madame Benoiton of the Caucasus. It is always being talked of, but is never seen, and the traveller invariably hears that, if he had only taken a different route, he would undoubtedly have found the auroch. Mr. Phillips-Wolley, who, as we have said, is an eminently truthful writer, does not profess ever to have seen aurochs, or to have had any reason for supposing he was near them; but a friend told him of a place where they were to be found, and Colonel G. had seen or shot them south of Elbruz. If Mr. Phillips-Wolley again goes to hunt in the Caucasus, we trust that he will endeavour to discover the aurochs, and we feel sure that he will find and slay them if anybody can; but we fear that the exasperating beasts will always be in the next valley but one.

From Poti the author took the railway to Kutais and Tiflis, having in the course of two journeys managed to see as little of the really interesting parts of the Western Caucasus as was possible. From Tiflis, of which he gives an excellent description, he started for Lesghia and the Caspian; and, after passing through some dangerous districts, and narrowly escaping assassination in one village, he reached the Lesghian mountains; but, though he was delighted with the honesty and hospitality of the Lesghians, he again showed the same strange indifference as a traveller; and, having got with much pain and trouble to Lesghia, did not apparently see nearly so much of it as he might easily have done, being intent on nothing but shooting. Returning to the post-road, he journeyed through what appears to be a very dull country to Lenkoran, which seems from his account to be a dreary and uninteresting place. Thence he returned to Tiflis, and, after a second stay there, went to Poti bent on visiting again that Black Sea coast to which he was so fervently attached. He regained his old quarters, and had good sport with the wild boars; but the bears left the seaside for the season just at the time when he arrived. He would have done well to have taken the hint which, returning good for evil, these intelligent animals gave him; but, unfortunately, he neglected it, and, staying too long on the coast, was caught by the winter rains, and, owing to the rapid rise of the rivers, had great difficulties in reaching Duapse, where severe illness, due to constant exposure and wetting, attacked him. With a brief account of his sufferings at Duapse, and of his return to Kertch, where he nearly died from diphtheria, his narrative ends.

It is not unlikely to have many readers; for, as we have said, it has merits which place it far above the average of hunters' stories. As a book of travel, it is disappointing; and it is not a little tantalising to find that a man who can describe so well should have been on the edge of a remarkable and little known country, and should not have cared to penetrate into it. Possibly, however, Mr. Phillips-Wolley will visit the Caucasus again, and in that case we trust that he will not disdain exploration which he will, we believe, find perfectly compatible with the destruction of animal life.

#### WORDS, FACTS, AND PHRASES.\*

THIS work, according to the description that the author gives of it on the title-page, is a Dictionary of Curious, Quaint, and Out-of-the-way Matters. To show still more strongly how far he has travelled outside of ordinary reading, he takes for a motto Poe's line, "A quaint and curious volume of forgotten lore." In his preface he tells us that it has been his aim to "comprise within the compass of a single volume a mass of curious, out-of-the-way information, acquired during years of labour and research from sources not easily accessible to general readers." His book, we fear, will be found more curious than his information; for the hodge-podge that he has made of scraps of knowledge and absurd blunders is not a little diverting. To enjoy it thoroughly it must be read, for no extracts can fully show the strange medley. Mr. Edwards, we will do him the justice to admit, is far more accurate as a copier than many of his rivals. He works to a great extent with the scissors and paste-pot, but for the most part he works carefully. He is not, however, happy in his selections; for he does not know what is pure ignorance and what is lore; neither can he distinguish between the lore of the present day and that which, according to his motto, is forgotten. When he comes to manufacture his own information, then he too often hopelessly breaks down. Perhaps he knows the class for whom he has compiled his book. By "general readers" very likely he means those who scarcely read at all. To such people a work of this character might be of the greatest value. At the modest price of twelve shillings and sixpence—nine and fourpence halfpenny, indeed, if

\* *Words, Facts, and Phrases: a Dictionary of Curious, Quaint, and Out-of-the-way Matters.* By Eliezer Edwards. London: Chatto & Windus. 1882.

they insist on having the full discount—they can set up for life as the oracle of their family, their tavern, or even of their village. A page or two carefully studied overnight would supply them with facts enough to disturb their friends or their neighbours for at least the next twenty-four hours. After a few weeks of such reading they would leave the parish schoolmaster far behind, and would even press the parson hard. They would become a public nuisance, for no one is a more offensive member of society than he who goes about armed with isolated facts as a mischievous boy is armed with a pocketful of peas. The man of facts, indeed, disturbs all good talk by the constant pelting that he keeps up, even more than the boy disturbs the quiet of a room by rattling his missiles from outside against the window-panes. At the same time, no doubt, what may be to us a terror may elsewhere be a terror mingled with admiration and even envy. How, for instance, would the company assembled in an inn parlour be amazed if the proud possessor of Mr. Edwards's Dictionary could point to an advertisement of Kinahan's whisky hanging on the wall and in an off-hand way inform them why it was called L.L. We remember well how many years ago a dispute arose in a small club of working-men as to the right pronunciation of the word *architect*. Some maintained that we ought to say *arkitect*, while others held that the first two syllables were sounded like the Scotch name Archie. One of the disputants was the shoeblick in a neighbouring school. He, it was voted, should ask the schoolmaster to act as an umpire, whose decision was to be taken as final. Now, though this particular word is not given by Mr. Edwards, yet there are many others which might well give rise to a question, not only as to their pronunciation, but also as to their meaning and derivation. How proud would the man be who, blessed with the possession of such an oracle of wisdom, could lay down the law as learnedly as the first teacher in the land! Newspapers are widely read, and in newspapers foreign words often are to be found. There might be a revolution in France, and a difference as to the pronunciation of the word *coup-d'état* might lead to a brawl in a tavern.

Tum, plateat gravem ac meritis si forte virum quem  
Conspexere, silent, arrectisque auribus adstant.

In other words, if the owner of *Words, Facts, and Phrases* arrived, the room would be hushed, the matter laid before him; and, while all pricked up their ears to catch his learned decision, he would give as a decision not to be disputed that they must all say *too-day-tah*. In almost countless errors would he be able to set them right. *Elizabethan*, it would seem, is commonly pronounced as if it were a word of six syllables. "It is," writes our author, "properly E-liz-a-be-than—not E-liz-a-be-thi-an." In like manner we are taught to say *bo-na-fi-de* in four syllables, and not *bond fide* in only three. If, anxious to make a parade of classical lore, we should talk of *otium cum dignitate*—the meaning of which is explained—we must also remember to say *dig-ni-ta-te*. In *alto rilievo*, the word *rilievo* must be pronounced *ree-le-aj-vo*. The termination *oid* forms two syllables; thus we must say *an-e-ro-id*, *rhom-bo-id*.

As to the meanings of words, many widespread errors are set right. Thus "the word *News*," writes Mr. Edwards, "is commonly believed to be formed of the initial letters of the names of the four cardinal points. If, however, this be the case," he adds, "it is difficult to understand how the synonymous foreign words *nova* and *nouvelles*, which are spelt in a totally different manner, can mean the same thing." *News*, therefore, is not what is blown to us from north, east, west, and south. Neither, we might add, are wens swellings that come from the west, east, north, and south. *Dupe*, we learn, has nothing to do with *duplicity*. We wonder that Mr. Edwards does not think it well to inform us that pig has nothing to do with pigmy, or cat with catechism. *Mammoth*, we find, is probably a corruption of *Behemoth*. "*Abandon* is from the Latin *ab* and *bandum*, a flag; meaning to desert one's colours." On the same page where this explanation is given we find the derivation of *abbot* from the Syriac word *abba*. Why did not our author go once more boldly to Latin to trace *abbot* from *ab* and *botum*; meaning a monk who rises from the bottom to be the head of a monastery? *Aborigines*, we find, is "the proper name of a peculiar people of Italy, who were not indigenous." We are aware that the common derivation from *ab* and *origo* is disputed; but Mr. Edwards ought to have fortified the one he gives by some greater authority than that of H. J. Pye, the Post-Laureate. Had it been on a question of poetry we might have accepted his judgment, for we remember how Porson thus celebrated his praises:—

Poetis nos letamur tribus,  
Pye, Petro Pindar, parvo Pybus;  
Si culeris ire pergis,  
Adde his Sir James Bland Burges.

Passing on from *Aborigines*, we learn that "Academy comes from *Academus*, the name of the owner of the grove near Athens where Plato taught philosophy," while the "Acropolis was so called from *Acrops*, the founder." Regent Street, we shall next be told, was so called after Regent, its owner; while all the High Streets are named after one Mr. High who founded them. If any one should maintain that this account of the origin of these words is incorrect, he must be careful not to abbreviate account into *a/c*, as many, if we are to believe Mr. Edwards, improperly do. Passing on, we read that "*Adjective* is from the Latin *ad*, to, and *jectus*, from the verb *jacere*, to throw, 'meaning to throw or change the noun into a descriptive word, or adjective.'" The children of the blackest Africans, the same great authority tells us, are both white. It may be some satisfaction to the fair sex to

learn that "the delicacy as to mentioning the age of women is no piece of modern sensitiveness. In the old Testament . . . there is but one woman whose age is recorded." The ancients in this respect would seem to have been far more sensitive than even we moderns; for, however unwilling a woman may still be to mention her own age, we have never noticed any hesitation in any one of them to mention the age of another. Agriculture is ingeniously derived from the Latin *ager*, a field, and *cultura*, cultivation. This curious, quaint, and out-of-the-way matter is given in a paragraph by itself. By the exercise of the same sagacity on the niceties of language, *acerbity*, *apparatus*, *error*, and *peninsula* are severally derived from *acerbus*, bitter; *apparo*, I prepare; *erro*, I wander; and *pene*, almost, and *insula*, an island. After remarking that *Alp* means white, our author adds, "It is singular that the names of nearly all the great mountains of the earth have some reference to their snow-covered summits." The first of the great mountains that he mentions is Snowdon, and the second Snafell, in the Isle of Man. He should have gone on, and added Snow Hill as his third. "*Amour propre* is a French phrase, literally 'proper love.' Applied in English to that proper amount of self-respect or self-esteem which no one else has a right to disregard or intrude upon." *Mon propre fils* would mean, therefore, we suppose, a son who behaves properly. *Strut*, we are told, comes from *strouthos*, an ostrich, because we strut like that bird; but *apoplosy* does not mean *Apollo-struck*. The derivation of *arable* would seem to be involved in doubt. "Bailey," writes Mr. Edwards, "has 'to are (a contraction of *arare*, Latin), to plough.' Arable land, according to this definition, is *ploughable* land." To show the distance to which the old English bow could carry, a reference is given to a speech of Falstaff in "2nd Henry VIII. 111." (*sic*).

We again return to our definitions, and find that *asparagus* is said to be derived from the Latin *a* intensive and *sparsus* to tear, and *pansy* from *panacea*. Coming to matters of history, we learn that "the Tower of London was established by William I." Here, however, Mr. Edwards deserves our gratitude. He shows, at all events, some moderation. He says that it was established; he might have said "inaugurated." For this the *Times* would have supplied him with instances enough. He might have assigned its foundation to Julius Caesar; he is content to go no further back than the Conqueror. Retracing our steps, we see that Goliath—as indeed his size deserved—has a whole paragraph to himself. His height was about eleven feet three inches, if, that is to say, we can trust a certain Mr. Greaves, who is quoted on this matter. A little before Goliath we find Garrick, who, we are told, "seems to have been originally a wine merchant." "Seems," Mr. Eliezer Edwards! Nay, he was. We know not "seems." Has not Garrick's Life been written? Does not Murphy tell us that "the famous Samuel Foote used to say, 'He remembered Garrick living in Durham Yard, with three quarts of vinegar in the cellar, calling himself a wine-merchant'?" Under the title "Macaulay's History of England" we read, "It is not generally known that there have been two distinct persons named Macaulay, who have each written a History of England." *Person*, by the way, in a paragraph all to itself, is defined by our author as any "distinct sentient being." If, then, in the passage we have just quoted, we substitute for persons this definition of it, the sentence will run, "It is not generally known that there have been two distinct sentient beings," &c. We hope, however, that the ignorance of mankind as to the two Macaulays is not quite so general as our author imagines. The great female Republican can scarcely be forgotten of whom Johnson, as a test of her levelling doctrine, asked one day, when dining at her house, that she would allow that very sensible, civil, well-behaved fellow-citizen, her footman, to sit down at table with them. With one more quotation we must bring our notice to an end. The following is the curious explanation that Mr. Edwards gives of *Déjeuner à la fourchette*. "French; literally 'a breakfast with a fork.' Applied in England to morning or mid-day meals of light character."

#### THE COMET OF A SEASON.\*

IT is, we fear, possible that readers of Mr. McCarthy's former works of fiction may be disappointed in *The Comet of a Season*, in the pages of which there is, comparatively speaking, but little of the freshness of observation, lightness of touch, and pleasantness of humour which we have become accustomed to in Mr. McCarthy's novels. The author has perhaps been unlucky in his subject, or has been inclined to take it too seriously, and has not mended matters by his occasional attempts to counterbalance this tendency. Anyhow the result is that he never seems to have completely made up his mind as to what kind of person his principal character really is, and, to say the truth, this character and his doings after a while become decidedly tedious. We have never before found Mr. McCarthy tedious; but unluckily in this case, as it is with the principal character, so it is with the subordinate personages and with the underplots, in which it is difficult to feel any interest. Mr. McCarthy has been wont to excel in the drawing of girls' characters, and in his present work he has given us one charming picture in Geraldine Howan. But in Malissa Aquitaine the writer has produced a character which is neither agreeable nor probable.

\* *The Comet of a Season*. By Justin McCarthy, Author of "Miss Misanthrope," "Dear Lady Disdain," &c. &c. 3 vols. London: Chatto & Windus, 1861.

and it must be confessed that Sydney Marion is a remarkably dull young woman.

The *Comet of a Season* opens so as to give a fair hope that the book will be well up to the standard of Mr. McCarthy's former work—a hope which, as we have said, is not afterwards fulfilled. The author begins by observing that he objects to the mysterious in fiction, and then proceeds to introduce us to a young married couple who are sitting together in a small public park just outside one of the great Northern towns of England. This young woman, we are told, was pretty, and was obviously a lady. The young man was strikingly handsome; but, in spite of a well-dressed and graceful appearance, "he still had something of what we cannot perhaps describe better than as the 'glorified artisan' air. The powers of witchcraft would not have been needed to enable any one with his wits about him to reach the quick conclusion that the young wife had somewhat descended from her social position to get to the young lover, and that she adored him all the more." He in fact is the son of a livery-stable keeper, and is now a clerk in the office of Aquitaine and Company; she is the daughter of a barrister, and the two fall in love over riding-lessons. The young man unluckily had got it into his head that "he was a man of genius, and a master-spirit. He had as yet done nothing. He had not even written poems or essays or begun a tragedy. He had not made speeches. He was curiously ignorant on most subjects. His reading had been only a few biographies of men who had risen from lowliness to greatness, some metaphysical books of a cheap and easy kind, the *Count of Monte Christo*, and a *Life of Mahomet*." It is a pity, by the way, that Mr. McCarthy should have passed the misspelling of *Monte Cristo* just quoted. In subsequent passages of the book the name is given correctly. The theme of his conversation with his young wife is himself and his desire to make a name. "'I want to be known as one who did great things for his fellow-man and the world, and I shall be known in that way some day. I don't want merely to explode—oh no, I want to blaze.' 'Wasn't there,' she said, 'one who blazed, the comet of a season?' 'I don't know; I haven't read much poetry. But I should rather be the comet of the season than not blaze at all.'" This introductory chapter ends with the death of the young wife, and the disappearance—no one knows in what direction—of the young man, whose name as yet we have not been told.

In the next chapter, fifteen or sixteen years are supposed, as the old novelists had it, to have rolled away; and in the description of the changed aspect of the Northern town in which we have seen the young couple we have one of the too infrequent passages in which the author has done himself justice. The place where the little public park used to stand has now become "the site of one of the favourite nests of the local aristocracy—the men who had made fortunes in shipping and on 'Change, and in all manner of commercial adventures and enterprises." They built themselves houses with conservatories below and observatories above. When the Queen Anne mania set in, they had houses of red brick "more intensely Queen-Anneish than anything of Queen Anne's day could possibly have been."

Little windows started out like Jacks-in-the-box exactly where they might least have been expected, with bars across them where there was not the slightest necessity for such precaution. Glass was specially manufactured of a thick greenish dinginess, and with bull's-eyes elaborately wrought in, so that the known imperfections of the glass-making craft in the Augustan age of English letters should add to the reality of the careful imitation. It was said by the friends of one of the enthusiasts in the cause of this architectural revival that he had little mechanical spiders ingeniously constructed to run up and down some of his window-panes, in order to give to his mansion the greater air of eighteenth-century realism, by suggesting the domestic untidiness of the days of Dean Swift.

One house among these is remarkable for the good taste with which it is designed, and this is the house of Mr. Aquitaine, head of the firm of Aquitaine and Company, who, it may be remembered, were the employers of the young man who disappeared after his wife's death. Staying in his house is his daughter Melissa's friend, Sydney Marion, who is expecting the return from America of her father, Captain Marion. There come with him as fellow-passengers his other daughter, Mrs. Trecoo, her husband, Miss Geraldine Rowan, the daughter of an old friend, and a mysterious stranger, named Montana, who, according to Mr. Aquitaine, is "a very remarkable man. They were talking a good deal about him when I was last in the States, but I never happened to see him. . . . I have never heard how he began; but he was a soldier in the war—the great civil war, you know; and he left what they call a good record there, and now he is a lecturer, or preacher, or something of the kind, and the head of a great new school, and has what people call a mission of some sort. I have no doubt he is coming to Europe on some mission." Montana, who is, of course, identical with the son of the livery-stable keeper, arrives and makes his impression on the assembled guests. Miss Rowan, who is, to our thinking, by far the best-drawn character in the book, has always distrusted him, and continues to do so till the end. Mrs. Trecoo adores him as a prophet of good; some of the others cannot make him out; and Melissa falls violently in love with him. He goes up to London; creates a sensation by issuing invitation cards in a peculiar fashion to all kinds of people for a discourse, to be given in one of the large halls; and succeeds in getting the thing so much talked about that, even before he appears, he has become the fashion. His speech—which treats of

the founding of a mysteriously grand and beautiful colony in America—is, in its way, a complete success:—

Montana spoke with deep feeling apparently, and with a kind of eloquence. He sometimes warmed into a glowing thought, sometimes even condescended to some quaint piece of humorous illustration. He held his audience from first to last. The whole discourse was entirely out of the common. It had nothing to do with the ordinary gabble of the platform. It had no conventional eloquence about it. There was no studied antithesis: the listener could not anticipate in the middle of a sentence the stock form of rhetoric with which it was to close. The wonderful eyes seemed to be everywhere. If by chance any of the audience became for a moment inattentive, he or she suddenly seemed to feel an uncomfortable sensation, and looking up found that Montana's eyes were fixed on the disloyal listener. A curious thing was that almost everyone in the room seemed to feel the direct appeal of Montana's eyes.

This is the beginning of the blaze of "the comet of a season"; in the subsequent history of which we are made perhaps needlessly acquainted with various meannesses, displayed by people who ought to know better, in the attempt to get Montana to their houses. One character among the people who run after him—a certain Lady Vanessa Barnes—seems intended to produce a striking effect on the reader; but it cannot be said that the author has here made much of a success. In his introductory description of Lady Vanessa, Mr. McCarthy's tact seems to have deserted him. "She had," he writes, "so much courage that she could always make the fullest use of any gift she possessed, and she had the audacious purity of a savage girl. She once played the part of a saucy page at some private theatricals in her own house, and when the play was over she mingled with the company for the rest of the evening in her page's dress, making fearless and full display of her beautiful legs." The incident of Lady Vanessa's securing Montana's appearance at an evening party, which follows hard upon this unpleasant description, is obviously intended to be amusing, but seems both tedious and disagreeable. Equally disagreeable, in another way, is the scene of the livery-stable keeper's death, at which his son, Montana, is present. Matters are complicated by the father's having adopted, after his son's disappearance, a young man named Clement Hope, who has some personal resemblance to Montana, and who becomes one of Montana's ardent disciples. Clement Hope is also in love with Melissa Aquitaine, who is in love with Montana, who is in love with Geraldine Rowan. But even out of this situation Mr. McCarthy fails to get any interest. In fact we must end, as we began, by recording a sense of general disappointment with Mr. McCarthy's latest work. We can only hope that those who care to follow further the fortunes of Montana may get more entertainment out of them than we have done.

#### CHRISTMAS BOOKS.

THE Christmas books of each season succeed and resemble each other as much as the winter berries in the hedges and the Christmas roses of December. These latter blossoms, with many other flowers of every month, decorate the pretty *Birthday Book* of Princess Beatrice (Smith and Elder). This is the earliest, and is sure to be one of the most popular, of the larger and more sumptuous gift-books of the season. The ordinary birthday book tries to give an appropriate quotation for every day of the year, and naturally fails in an impossible task. There are only a few remarkable days in the modern year—those marked by great events, or popular superstitions or customs, or the fixed fasts and festivals of the Church. For all other days the mottoes must be chosen at random. The Princess Beatrice has, therefore, chosen no mottoes at all, but gives each day in the month a fair broad page with a decorative border. There is room and verge enough for people who write their signatures to add appropriate verses of their own, if Apollo has touched their lips with the sacred fire, and if the bees of the Muses have hummed above their heads in infancy. In short, the *Birthday Book* may answer the purposes of the ancient album dear to our grandmothers. For every month the pencil of the Princess has designed a garland of flowers and grasses; snowdrops for January; poppies, daisies, and blue corn-flowers for August; red berries for October; "wild roses and ivy serpentine" and honeysuckles for June; chrysanthemums for November; holly and mistletoe and Christmas roses for December. The drawing and colouring are correct and graceful, and are well reproduced by chromolithography. The cloth covers are stamped with a very pretty design, and the book is certain to secure a wide popularity.

Mr. Verker Hamilton and Mr. Stewart Faxon have combined—we do not quite know in what proportions—to produce *Scenes in Ceylon* (O Chapman and Hall). This volume of sketches and verses is certain to be the book of the season in distant Colombo, and we can heartily recommend it to English sportsmen who want a lively record of life in Ceylon. The collaborators begin at the beginning, and show us the new comer to Ceylon being paddled through the surf in outriggers by almost naked natives. The way in which Mr. Hamilton has drawn the plunge of the frail canoe is almost too realistic to be quite comfortable. The pencils of both partners have combined, as we guess from the monograms in the corners of the sketch, to delineate Galle Face, "Colombo's Park or Prater." The perspective here, as in all Mr. Hamilton's sketches, is excellent; the figures in the foreground will no doubt be recognised in Colombo. "The New Clearing" shows the planter what he has to expect. The fire has cleared out his lot—a delicate operation,

for if rain falls while the fire is busy the land becomes worthless—and the planter, from his shady hut, surveys the work of black women labourers. "The Shuck Estate" shows the same girls at work; it is a drawing in the style of a Cingalese or Tamil Millet. "A Hunting Morning" is a sketch of an interior in the country, a very careful drawing of the rude arrangements of a hut in which three sportsmen are breakfasting or lounging. Then follow pictures of the chase, till the stag stands at bay in what, but for the rich tropical plants, one might take for a Highland burn. The boulders and branches and foliage are drawn with very praiseworthy care and success; in fact, we have rarely seen the light and shade of deep woods better reproduced. The same praise may be given to the rocky hill-side from which the coolies are returning, their labours over for the day. There are other sketches of civilized and savage dances; of the Tamby or itinerant pedlar, in the drawing-room of a prosperous planter; but perhaps the best drawing in the volume is that of the distant palm-tree trunks on the fringe of the polo-ground. There is also a splendid elephant, within range of the stalker, and a ferocious "rogue" charging through a jungle of reeds. In short, this is one of the very best books of the kind we have ever seen; and the verses, if not very polished, are full of life and movement.

There are plenty of adventures in *Who Did It?* (Rev. H. O. Adams. Griffith and Farran). We do not know whether there are any schools at all like that which is described here, and rather hope, on the whole, that such seminaries are rare. But many lads will read the book with all the more pleasure because the adventures rather resemble the dreams than the reality of schoolboy existence.

*Hood's Comic Annual* (Fun Office) is not a particularly mirthful publication, but some of the woodcuts are amusing.

*The Magazine of Art* (Cassell, Petter, and Galpin) contains an immense quantity of miscellaneous literature, and is enriched with woodcuts of various degrees of merit. Some are *clichés*, usually representing large pictures; others have fresher merit. The Galleries of the year are criticized, and, though the criticisms may have had some temporary interest, yet this part of the contents of the magazine is rather out of place in a volume. The articles illustrated are not always those that best deserve illustration; and we especially miss illustrations, just where they are most needed, in the essay on the Roman Villa at Brading.

The designs in *Old Proverbs with New Pictures* (Cassell, Petter, and Galpin) are very graceful and clever, and the artist has a wide range of subjects. They are not at all imitative, but stand on their own merits. The rhymes, by Mr. Mateaux, are scarcely worthy of their settings.

*Comic Insects* (Warne and Co.) are drawings by Mr. Berry F. Berry, and are rather ignominious than humorous.

The drawings in *Sugar and Spice* (Strahan and Co.) are marked by a pleasant understanding of the ways of children, and will please old and young people.

*A Leal Light Heart* (Annette Lyster. S.P.O.K.)—It is pleasant year by year to welcome back old friends, and to find, as in most cases we do find, that they have lost none of their attractions. Miss Lyster is one of these. Her stories are interesting in themselves, and told in simple, careful language which is agreeable to read. *A Leal Light Heart* is the story of two cousins, bound by the terms of their parents' wills not to marry without the consent of their guardian till they have attained the age of full discretion. This guardian, a strong-willed widow lady, with a reputation for match-making, has given her consent, prior to the opening of the story, to the engagement of her wards with two penniless young men; but, when the girls become heiresses, withdraws her permission, and takes them to live with her. The heroine, Emily, is one of the pleasantest girls we have met with for a long time; resolute, but neither forward nor given to preaching, lively, and true. She ends by getting her own way, and marrying the blind curate of her choice. Her companion, Gwenevere, who always bore the impress of the last person she was with, is easily persuaded to relinquish her lover, and to make a *mariage de convenance* with a cousin. She is afterwards punished for her perfidy by becoming the mother of one of the most horrid little children in fiction or out of it.

*We Four* (Mrs. Reginald Bray. Illustrated by Miss W. Erichsen. Griffith and Farran).—It is by no means an easy task to write a history of the doings of four naughty children, so that the children who read about them shall neither feel priggishly superior to them nor yet anxious to imitate their tricks; therefore it is not wonderful that Mrs. Bray's tale is not wholly a success. Anything ruder or more disagreeable than the girl who relates the adventures could not well be imagined, and it certainly needed some one very different from her weak father to keep her in check. We have seen for ourselves what children can become who are on principle never punished, and the experience was not a pleasant one. Mrs. Bray has fallen into the common mistake of supposing that, because she has made the lives of children the subject of her story, it must therefore be suitable reading for all those of the same age. This is not, however, the case. Any book calculated to develop self-consciousness and precocity is harmful, and it surely is very undesirable to open little minds to the amount of toadyism and humbug afloat in the world. The illustrations, too, are poor.

*Out on the Pampas* (G. A. Henty. Griffith and Farran).—The adventures of the English family who go out to settle in the Pampas are very excitingly told. We have a great deal about Indian raids, in which, it is needless to say, the Indians are always

ignominiously worsted; and we have a picture of a white girl, and rescue of a white girl. It seems a pity that such extraordinarily gifted beings, who had besides the talent to succeed, should have deprived English society of their presence for six whole years; but, on the other hand, if it is possible to make a fortune and retire to the mother-country within so short a time, why do we not all go out to the Pampas? Perhaps we have not all the necessary gifts. The book has given us much amusement, and it would be pedantic to cavil at a story on account of its improbability. The illustrations are neither better nor worse than usual.

*Missy and Master* (M. Bramston. S.P.O.K.) were, when they first make their acquaintance, a little circus girl known as the Infant Wonder, and her performing pony; but they ultimately part company, the one to become a pony in high life, the other to become an inmate of an industrial school, where she was about as welcome as an eagle in a dove's nest. She led her teachers a terrible life, instilling into the minds of the pupils a mysterious contempt for domestic service, which was finally traced to a lurking wish to dance in the pantomimes, as Missy aspired to do in the future. This bad little girl only looked on baptism (which ceremony had in her case been omitted) as a means of obtaining the names of "Ida Evelina Violet," after which her soul hankered. Her numerous pranks bore disastrous fruit one day, when she had been jumping from the banisters downstairs, and was emulated by one of her companions, who breaks her arm in her fall. Missy is scolded by her governess, and forms a resolution to behave better. By way of carrying this out, she addresses the maimed dame thus:—"Sarah, you're a fool." Sarah, who did not particularly enjoy this mode of address, turned her head away. "Yes, you are. What business have you got to go and try to do what I can? I told you you couldn't. I've been brought up to do it all my life, but you haven't, and you've no business to try to do such things. And I tell you what. I won't have none of you trying to do the things what I do, if I can help it. So don't let me hear of none of you going and playing them pranks again. There ain't no reason why you should go and get yourselves into trouble because I chose to practise against the time I dance in a pantomime." As will be seen from this extract, the conversation is most original and amusing. We wish we could give the illustrations equally high praise. As it is, we feel bound to say they are feeble productions, both as examples of art and also as being pictures of anything contained in the story. Who, for instance, would ever guess that the fashionable young lady with long, flowing hair and kilted skirts (p. 122) is a child at an industrial school? It would be well if, before illustrating a book, the artist would sometimes read the story, as such illustrations as these, far from adding to the attractions of the tale, absolutely detract from its merit.

*The Three Frights, &c.* (Sarah Tytler. Marshall and Co.)—Miss Tytler cannot be altogether congratulated on her new book. We have an uncomfortable feeling that it is all moral, which is not a propitious frame of mind in which to read a story. The first tale is the best of the three. The second, about the nieces of Horace Walpole, who were so unfortunate in their matrimonial schemes, is an absolute failure. It is impossible to imagine high-born ladies of 1780 exclaiming, "It is too horrid." Still less was a gentleman of that date likely to remark, when speaking of the Princess Dashkoff's probable guilt, "I daresay Paul died in his bed a natural death, or at least that this woman had no hand in his assassination"; for the Emperor Paul did not die, naturally or otherwise, for twenty-one years after the Gordon riots, and the person in whose murder the Princess Dashkoff was implicated was his father, Peter III.

"L. O.'s" stories and T. Pym's drawings in *Children Busy, Children Glad, Children Naughty, Children Sad* (Wells Gardner, Darton, and Co.), make one of the prettiest and most attractive Christmas books we have seen for a long time. The stories are, indeed, of a far higher order than is generally looked for in books of the kind. They have a fine touch both in humour and in pathos which recalls, while it in no way suggests an imitation of, Hans Andersen. To make an extract from any of the stories would hardly be fair to the author. We may, however, quote one of the few sets of verses which the little volume contains:—

Swing, swing, swing,  
Through the drowsy afternoon;  
Swing, swing, swing,  
Up I go to meet the moon.  
Swing, swing, swing,  
I can see as I go high  
Far along the crimson sky;  
I can see as I come down  
The tops of houses in the town.  
High and low,  
Fast and slow,  
Swing, swing, swing,  
Swing, swing, swing,  
See! the sun is gone away;  
Swing, swing, swing,  
Gone to find a bright new day.  
Swing, swing, swing,  
I can see as I go  
The poplars waving to and fro;  
I can see as I come down  
The lights are twinkling in the town.  
High and low,  
Fast and slow,  
Swing, swing, swing.

The school of Miss Kate Greenaway, are greatly coloured. There are certain faults in the drawing, but these may perhaps be set right in future. T. Pym would do well especially to study the conformation of the human skin. There is so much "go" in the compositions that it would be well worth while for the artist to attempt to do yet better.

In *Under the Sunset* (Sampson Low and Co.) Mr. Bram Stoker has produced a book which may please grown-up children as well as the smaller readers to whom it is specially addressed. The writer has a graceful fancy, the forms of which he expresses in excellent English, an accomplishment by no means too commonly met in children's or, indeed, in other books. *Under the Sunset* is well illustrated by Messrs. Fitzgerald and Cockburn, who have caught and expressed the author's delicate fancies with keen perception.

#### AMERICAN LITERATURE.

WE are glad to observe that such a book as the *Republic of Republics* (1) has reached a fourth edition in America. The fact indicates that, among those who have both the leisure and the inclination to make a thorough study of constitutional principles—and the leisure and inclination are less commonly combined in America than elsewhere—there is at least a large number desirous to learn all that can be said upon the unpopular side of the controversy which is commonly supposed to have been finally decided. If that decision is final and extends as far as the dominant party would carry it, there can be little doubt in the minds of any who have really mastered the Federal Constitution that the victory of the North was a revolution—changed completely the character of the Union. The first principle, the fundamental idea, of the Constitution as framed by the Convention of 1788, was the sovereignty of the States. At that time no one questioned that sovereignty. England, it cannot be too often repeated, never recognized the Union. She recognized by the treaty of peace thirteen united States, each by name. The revolutionary war was waged to turn the colonies, not into an independent Republic, but into independent and sovereign States. Their sovereignty was under the Articles of Confederation so absolutely unfettered, Congress was so absolutely powerless, that there seemed no little danger lest the Confederation should become a nullity. To prevent this, a Convention, authorized by the States in their sovereign capacity, but possessing no sort of authority over them, prepared a new Constitution. That that Constitution was accepted, not by the people of the united States, but by the several peoples of each State in their individual capacity, no one who knows the facts can well deny. The first and great secession was the secession, one by one, of nine States from the original Confederation, and their entry into the Union formed under the new Constitution. Each of these sovereign States came in separately; the concurrence of nine was required to put the Union in force. The other four came in when and as they pleased, and some among them remained independent, not united with their former confederates by any bond whatever, for months, and, if we remember rightly, in one case for more than a year. It is commonly forgotten on both sides of the Atlantic that the Convention discussed and denied the right of coercing a State; that Mr. Lincoln, eighty years later, tacitly confessed that such coercion was unconstitutional—i.e. criminal—by the evasions under which he disguised what was simply aggressive war. That in the frenzy of hate which followed his death, in the elation of victory, his Ministry did not dare to bring any Confederate leader to trial for high treason is another of the forgotten facts of the case. We now learn for the first time that the question was discussed by the first lawyers of the victorious party, and that, after some months of careful study, they came to the conclusion that no Court could possibly convict even the President of the Confederate States of treason against the Union. That is, it was admitted by counsel engaged to get up a case for the prosecution, all of them violent politicians as well as lawyers, that secession was not treason—that is, that the States were sovereign. And it follows that the traitors were those who in West Virginia and in Eastern Tennessee bore arms against the State to which their allegiance was due. Whether Congress be or be not the supreme Legislature of the Union; whether the President be or be not empowered to interfere by force, uninvited, in the internal affairs of a State, are still questions of vital moment—questions on which the character and fate of the Union may depend. We believe no American lawyer would dream of suggesting that Congress is competent to enact a national law of divorce, for example, gravely as such a law is needed, or to alter the penalties of theft, arson, or murder anywhere save in the territories or the district of Columbia. All these and many other equally interesting and vital considerations are set forth at great length in the work before us. It is, however, too much of a party pamphlet, and too little of a constitutional treatise—a defect due probably to the circumstances in which it originated. The first edition was published as a protest against the proposed trial of Jefferson Davis. The author has thought it desirable to exclude from the mass of evidence which he collects the opinions and statements of all the great historical representatives of States' rights doctrine as that of partisans

whose dicta will not be accepted by opponents. Unfortunately for this principle of selection, many of these men were notoriously the spokesmen not of a party, not even of a single State, but of many sovereign and independent communities. What Jefferson and Henry thought, what they held to be the vices of the Constitution and what its safeguards, is matter whose exclusion leaves any treatise on the subject imperfect. What they and others in their position said explains on what understanding and with what reserves the sovereign States of Virginia, Georgia, and the Carolinas entered the Union. As Virginia expressly reserved the right to secede, it would be difficult for any reasonable man to deny that the invasion of Virginia by Mr. Lincoln's Government was a distinct breach of treaty, unprovoked by any previous breach on the Virginian side. But the importance of that official reservation, great as it is, is not a little enhanced by a careful study of the views of Virginian statesmen at the time. Calhoun was, no doubt, an extreme partisan; but on Constitutional questions Calhoun spoke the mind of the South. No higher authority could well be cited to show in what sense the treaty forming the Constitution of the Union was accepted at that time by the fifteen States south of Mason and Dixon's line. The work before us, then, is not that important desideratum, a complete statement of the Constitutional case in favour of State rights, but it is a most valuable contribution to the comprehension of that case, and, taken together with a work like the masterly treatise of Vice-President Stephens, may serve to show the outlines and most of the details of the argument. How overwhelmingly strong it is, even after recognizing that the prosecution of Mr. Davis was abandoned as legally hopeless, the vast majority of Englishmen, and not a few Americans, will be surprised to learn. Indeed, the Federal Government, even in the hands of violent Republicans, has shown a certain curious consciousness of its strength. It trampled on every Constitutional right of the Southern States, but it has not ventured even to enforce unquestionable Federal obligations on the recalcitrant State of California; and that State may, we believe, do anything but formally secede from the Union without provoking forcible intervention from the Federal Government.

Mr. Mackenzie's *History* (2) is a party pamphlet in another and much worse sense. On the two great incidents of American history—the War of the Revolution and the War of Secession—there is, we fear, very little hope that Americans or Englishmen of the rising generation will be correctly informed. The current histories, and especially the school and college histories, are something worse than careless or one-sided in their account of every critical fact in either of these two signal events in the annals of the Union. A boy who takes his notion of either from a writer like Mr. Mackenzie—and Mr. Mackenzie is hardly a worse offender than the majority of his competitors—had better perhaps have remained entirely ignorant of the subject. One vital fact in the long interval of peace Mr. Mackenzie could not altogether distort, and he has stated it with a vivid sense of its importance which gives unusual force and clearness to the impression made upon his readers. The invention of the cotton-gin was the most important incident in the history of slavery. Its moral bearings Mr. Mackenzie systematically misrepresents. He has not the fairness to own that the abolition of slavery in the North rested on no moral considerations whatever; that its retention in the South because it paid stands exactly on a par with the sale to the South of the Northern negroes, because in the North their labour was not remunerative. That in 1790 no considerable class or party in the Union thought slavery immoral the Constitution unanswerably testifies. To accuse the Southerners of having changed their opinion on the subject because slavery became profitable is quite unwarranted. The change of opinion took place in the North, not in the South; and, as few who have studied the facts can doubt, it would have been very slow, very partial, and would have left slavery still prevailing throughout the Union at this hour but for the coincidence of Northern interests with sectional prejudice and passion. How far the falsification of American history has been carried, how little the studies of later life avail to correct the worse than ignorance implanted at school, has recently received a signal illustration. When we find a writer like Mr. Goldwin Smith repeating and emphasizing the absurd fiction which represents the New England Puritans as champions of religious liberty, we may understand how utterly distorted are the ideas current among ordinary men of education on both sides of the Atlantic respecting the principal facts of American history.

We think it would be difficult to over-estimate the value in its own special field, and as a mere contribution to the literature of an exceedingly interesting subject, of Messrs. Shaler and Davis's *Glaciers* (3). The leading facts with which this monograph deals may be found clearly, though much more briefly, set forth in more than one popular work; in none perhaps better and more clearly than in Mr. Wallace's most recent treatise on the Distribution of Life. The glaciers of the Alps, of Greenland, and of a few less well-known mountainous tracts, are the relics or the miniature reproduction of an age of glaciation, an age when ice covered, as is now generally held, the whole of Northern and Central

Europe that was not under water, and, according to the authors of this volume, the whole of North America down to the Ohio and the Missouri. How greatly the present form of the earth's surface has been affected by that glacial period, how very large a share ice has had in the formation of lakes, valleys, river courses, harbours, in the shaping of coast lines and mountain ranges, only a careful study of works like that before us can fully inform the reader; but we believe that no one of the powers by which the present form of the world has been shaped is so imperfectly appreciated by all but careful students of geology. The action of the sea is probably exaggerated by current opinion. Those who think they understand the subject at all generally overrate also the work of rivers and rainfall, ascribing to them much that was actually accomplished in a shorter period by the far more powerful agency of moving ice. Upon no subject has geological knowledge extended more widely and more rapidly of late than upon the evidences of glacial action over an enormous extent of the earth's surface. These evidences are recorded in the most striking manner by the numerous photographic plates at the end of this volume—to illustrate and explain which, indeed, was the original purpose of the text, greatly as its scope has been extended in the course of execution. A few of them, from the inevitable defects of photography, fail to convey any distinct picture even to a careful observer. But most of them are eminently successful and effective. The plates are beautiful enough to ornament a drawing-room table; combined with the text, they form a monograph invaluable to any scientific library.

Mr. Howe has given to his elaborate, tedious, and needlessly technical work on the monetary systems of the present age perhaps the most inaccurate title he could have chosen (4). The simple, obvious common sense of the matter is just that which Mr. Howe not only misses, but actually denies. That metallic money derives its sole, or almost its sole, value from the mercantile worth of the metal whereof it is formed; that this is the vital essential distinction between token money like our shillings, which derive their value from the legal rate of exchange, and silver francs or dollars, which are worth exactly the quantity of silver they contain; that gold is a commodity exactly like any other, and the value of a sovereign exactly that of the gold it contains plus the cost of mintage—these are the truths that lie at the root of the whole science of currency. A man who misses these can have nothing to say which is worth the attention either of practical or of scientific economists; and as Mr. Howe begins by ignoring or denying these essential truths, the rest of his work is hardly worth the labour of perusal—a labour greatly and wantonly enhanced by the exceedingly tedious phraseology which, in expounding what he calls the “mathematics of money,” it has pleased the author to employ. In truth, as is the case with most crotcheteers on this subject, he seems to have begun by bewildering himself, and will no doubt succeed in bewildering a certain number of readers.

Mr. Appleton's series of volumes on Building a Home, on laying out Home Grounds, on the Home Garden, and on Household Management (5), are pleasant as well as practical reading, but their practical value is from the necessity of the case almost confined to America. The conditions of building, the value of land and domestic arrangements, are so different in England and America that from a practical treatise intended for the guidance of readers of the one country those of the other can at most only pick up a few useful hints. *The Amenities of Home* is a work of a somewhat different, a much more generally valuable and yet hardly less practical, character. Simple, unaffected, and unpretentious, it contains, we think, more sound practical sense upon a subject interesting to all, and yet on which few can write what is worth reading, than any book of good advice we have lately seen.

The *Proceedings of the American Association for the Advancement of Science* (6), like those of its elder sister on this side of the Atlantic, are hardly literature in the proper sense of the word. They are, however, of such general interest that we can hardly pass over without mention the two solid volumes which record the proceedings of the twenty-ninth meeting, held at Boston in August 1880.

To Mr. Merriam's treatise on the Figure of the Earth (7) the same remark applies. It is purely mathematical and technical, but contains some observations on ancient geometry and geodesy from the mathematical point of view which possess a more general interest.

Mr. Elder's Memoir of Henry O. Carey (8) has at least the merit claimed for it. It is, what very few American memoirs are, a “brief biography.” Mr. Carey, as our older readers at least will remember, was perhaps the most distinguished, certainly the most popular, economist of the United States. He owed his popularity, however, less to his intellectual powers and mastery of his subject,

both of which undoubtedly entitled him to attention, than to the singularly perverse use he made of them. No other writer on economic science of anything like equal ability and knowledge has devoted his powers, not to correct, but to justify, the economic follies of his countrymen, to contradict all the first principles of practical economics as understood by every leading European authority with scarcely an exception. The Fair-traders of to-day might find a store of plausible Protectionist arguments, such as they have shown no ability to devise for themselves, in his well-known treatises.

On natural history we have some volumes of more than usual interest. Dr. Henshall devotes a solid octavo volume of 450 pages to the Black Bass (9)—the American perch, it might perhaps be called—to its haunts, habits, structure, and place among fishes, and to the means of capturing it according to rule. The work is half scientific, half sporting, and in both branches the author seems equally interesting and equally master of his theme. Mr. Hervey's work on Sea Mosses (10) has fewer attractions for the general reader; but to the collector or botanical student, for whom it is apparently intended, both the text and the excellent coloured drawings which illustrate it will doubtless be attractive. The one grave defect in Mr. Scudder's monograph on American Butterflies (11) is the absence of colour in the illustrations, which, being mere engravings, can show only the form and shading of these beautiful insects, and therefore fail to give any true idea of their especial glories to those who have not observed them or their like. *New England Bird Life* (12) has avowedly a limited and purely local scope, and, even so, it is imperfect as yet, dealing only with the class of Oscines.

Mr. Bailey's *Book of Ensilage* (13) deserves a mention, though its value is purely technical and professional. It sets forth at length a method of preserving green corn, largely used for the feeding of cattle in America, and other fodder in a fresh state, without the fermentation or putrefaction from which in the ordinary methods it is impossible to preserve even imperfectly dried grasses. By feeding cattle on fodder that retains all its juices fresh and sweet as when first cut, the quantity of milk obtained from a given amount of food is, of course, largely increased. The subject may be well worth the attention of our dairy farmers. Dr. Thurber publishes another similar pamphlet on the same subject (14).

Dr. Wheeler's *Foreigner in China* (15) contains a good deal of useful information respecting the recent relations of the United States and of England with the Celestial Empire, known, no doubt, to those who happen to remember the newspapers of the time, but forgotten by a much larger number. But the writer's heart is in another part of his work, the description of missionary efforts and of the obstacles they have met; and on this subject he has much that is new and interesting to say.

That any one should think it worth while to write and publish a minute and elaborate account of the dramatic career of Mr. Edwin Forrest (16) may seem, to those for whom the interest of the theatre is purely ephemeral, somewhat surprising. It would appear, however, that Americans have either an unusual amount of leisure to bestow on the biography of public characters, in whatever career their notoriety has been acquired, or a very special preference for this kind of literature. The multitude of biographies of men far less generally known than Mr. Forrest, and of scarcely more public importance, is one of the most inexplicable phenomena of Transatlantic literature.

*Boston Town* (17) is a popular kind of history of the oldest, and perhaps in many respects still the first, of Anglo-American cities, given in the form of familiar conversations between a grandfather, who personally remembers great part of the facts he relates, and grandchildren who do not seem to find either himself or his information tedious; a fact less surprising, perhaps, in this case than in most books in which the same form has been adopted.

We have several volumes of verse, whereof Mr. Bayard Taylor's *Home Ballads* (18) alone perhaps deserve the name of poetry. The worst of all is a veridical biography of President

(11) *Butterflies; their Structure, Changes, and Life Histories, with special reference to American Forms.* Illustrated. By Samuel H. Scudder. New York: Holt & Co. London: Trübner & Co. 1881.

(12) *New England Bird Life.* Revised and Edited from the MS. of Winfred A. Stearns, by Dr. E. Coues, U.S.A. Part I. Oscines. Boston: Lee & Shepard. London: Trübner & Co. 1881.

(13) *The Book of Ensilage; or, the New Dispensation for Farmers.* By J. M. Bailey. Farmer's Edition. New York: Orange Judd Co. London: Trübner & Co. 1881.

(14) *Stilts and Ensilage.* By Dr. G. Thurber. Illustrated. New York: Orange Judd Co. London: Trübner & Co. 1881.

(15) *The Foreigner in China.* By L. N. Wheeler, D.D. With Introduction by Professor W. C. Sawyer, Ph.D. Chicago: Griggs & Co. London: Trübner & Co. 1881.

(16) *Edwin Forrest.* By Lawrence Barrett. Illustrated. Boston: Osgood & Co. London: Trübner & Co. 1881.

(17) *Boston Town.* By H. E. Scudder, Author of the “Bodley Books.” Illustrated. Boston: Houghton, Mifflin, & Co. London: Trübner & Co. 1881.

(18) *Home Ballads.* By Bayard Taylor. Illustrated. Boston: Houghton, Mifflin, & Co. London: Trübner & Co. 1880.

*Lincoln* (19), which contrives to render ridiculous even what was really great or pathetic in the story of a man whose position was far above his powers, but whose powers seemed constantly to rise towards, if never up to, the greatness of his opportunities. *St. Olaf's Kirk* (20) has merits, or it would hardly have reached a second edition, but scarcely merit enough to secure it a Transatlantic circulation. *The Consolation* (21), a treatise on death and other human calamities, will hardly console a single reader. The volumes containing Shakespeare's tragedies of *Cymbeline* and *Coriolanus* (22) complete, we are informed, a new carefully expurgated and annotated edition of Shakespeare intended for school use.

(19) *Abraham Lincoln; the Type of American Genius: an Historical Romance.* By Rufus Blanchard. Wheaton: R. Blanchard. 1882.

(20) *The Legend of St. Olaf's Kirk.* By G. Houghton, Author of "Christmas Booklet," &c. Second Edition, revised. Boston: Houghton, Mifflin, & Co. London: Trübner & Co. 1882.

(21) *The Consolation: a Poem.* By G. Gerrard. Toronto: Hunter, Rose, & Co. 1881.

(22) *Annotated English Classics.—Shakespeare's Cymbeline and Coriolanus.* With Introduction, Notes, &c. for use in Schools and Families. By the Rev. Henry N. Hudson. Boston: Ginn & Heath. 1881.

**THEOLOGICAL, UNIVERSITY, MILITARY, CIVIL SERVICE,** and other EXAMINATIONS.—PUPILS rapidly and successfully prepared. Terms moderate. Highest references.—Address, Rev. W. H. ROWLANDSON, Great Brasted, Witham.

## AMESBURY HOUSE, PAGE HEATH, BOKLEY, Kent.

Rev. EDMUND FOWLE, Author of a very successful Series of Latin and Greek School Books, receives THIRTY-THREE BOYS, under the age of Fifteen, to prepare for the Public Schools.

## WOOLLEY GREEN, near HURSLEY, HANTS.—

A. M. HEATHCOTE, B.A., Oriel Coll., Oxford, prepares YOUNG BOYS for Public Schools, &c. Number under Twenty. Two Resident Assistant-Masters. The house is quiet in the country, and in a healthy position. Full particulars on application.—Address, Woolley Green, near Runcy.

## HYERES, South of FRANCE.—An OXFORD M.A., and

Barriester-at-Law (Married), an experienced and successful Tutor, residing in his own Villa, which is most beautifully and healthily situated, receives SIX PUPILS in delicate health. Special advantages for French conversation.—Address, W. HERLEY CHATEL, Les Bains, Hyeres (Var), France.

**INDIAN BOYS.**—Rev. R. A. CAYLEY desires to make a HOME for Two or Three (brothers preferred), aged from Eleven to Sixteen, and to send to Public School with his own Sons.—For terms, &c., apply Scampton Rectory, Lincoln.

**EDUCATION.—SOUTH KENSINGTON.—A LADY,** who has resided several years on the Continent, who holds a Cambridge Certificate (Honour), and who was formerly governess in a Nobleman's family, receives a limited number of PUPILS. Eminent Professors. Desirable companionship.—Address, PRINCIPAL, 128 Lusham Gardens, Cromwell Road.

**BOYS from Public Schools and others RECEIVED for the CHRISTMAS VACATION** by the HEAD-MASTER of CHARDSTOCK COLLEGE, Dorset.—Particulars on application.

**A RESPECTABLE COUPLE,** giving up housekeeping, would be glad to meet with a SITUATION OF TRUST; town or country. A nobleman or gentleman with fishing or shooting box would find them capable of doing all required; have been in good families.—Address, J. M. 7 Bayham Street, Camden Town.

**NEXT PRESENTATION.—For SALE,** the next PRESENTATION to a valuable RECTORY, with very superior House and Grounds, Vineyard, and Gardens, charmingly situated, in the County of Suffolk, within a mile of First-class Station and Market Town, and easy drive of the Sea. Population about 1,000. Good Parish Endowments. Income about £1,000, chiefly from Rent Charges.—Apply to Mr. R. H. HENRY, Solicitor, Lowestoft, or Messrs. FLICK & SON, Land Agents, Saxmundham, Suffolk.

## TO NEWSPAPER PROPRIETORS, PRINTERS, &amp;c.—As

the "Pall Mall Gazette" will on and after January 2 next be produced on New Fast-Perfecting Machines, the MACHINERY by which the paper is at present printed is for SALE. It consists of two Hot Printing Machines, complete—a Six Feeder and a Four Feeder. They are both in perfect working order and in excellent repair, and can be seen at work in the "Pall Mall Gazette" Office any afternoon, by previous arrangement. For further particulars apply to the MANAGER, "Pall Mall Gazette" Office, 2 Northumberland Street, Charing Cross, W.C.

## INVESTMENT in PUBLIC-HOUSE PROPERTY.

INVESTMENT may be made of Sums and Multiples of £100 up to £1,000 in purchase of Joint Ownership—anonymous if desired.—IN PUBLIC-HOUSE PROPERTY to yield reliable interest of 10 per cent. from thoroughly tried Businesses.—Particulars to be obtained upon application—personal or with reference—to Messrs. WALTER JARVIS & TRIGGOTT, Solicitors, 5 Chancery Lane, W.C.

## BRIGHTON.—BEDFORD HOTEL.—Facing Sea and

Esplanade. Near the West Pier. Central and quiet. Long established. Suites of Rooms. Spacious Coffee-room for Ladies and Gentlemen. Sea-Water Services in the Hotel.

BENJN. BULL, Manager.

## SPECTACLES versus BLINDNESS.

ONE-FOURTH of those suffering from blindness can trace their inability to the use of common spectacles, or lenses imperfectly adapted to the sight. Mr. HENRY LAURANCE, F.R.S., Oculist Optician, PERSONALLY adapted his Improved Spectacles at his residence, 3 Endsleigh Gardens, Euston Square, London, daily (Saturdays excepted) ten to four. SIR JULIUS BENEDICT writes:—"I have tried the principal opticians in London, but your spectacles suit me admirably. The clearness of your glasses, as compared with others, is really surprising." DR. BIRK, Chelmsford, late Surgeon-Major, W.E.M., writes:—"I could not have believed it possible that my sight could have been so much improved and relieved at my age, 65. I can now read the smallest print, although suffering from cataract on the right eye." Similar testimonials from Dr. Hasdell, Consulting Physician, Westminster Hospital; Gen. Archdeacon Palmer, Colonel J. Lloyd-Gregh, C.B., Aldershot; the Rev. Mother Abbess, St. Mary's Abbey, London, and hundreds of others. Mr. Laurence's Pamphlet, "Spectacles, their Use and Abuse," sent free.

## KOUMISS.

THE original British Koumiss Manufactory of E. CHAPMAN & Co., 15 Duke Street, Portland Place, London, W., established 1870. Proprietors of the "British Medical Journal," &c., together with prices and particulars on Koumiss Extract for export, and Sparkling Mineral as a table beverage. Our Koumiss, sold at less than half the price of Maria's Koumiss, through all Chemists.

DR. JAGIELSKI'S KOUMISS, as a sole article of Diet.—Dr. SUTHERLAND brought forward, February 11, 1881, at the Clinical Society, a case of obstinate vomiting, in which no food was taken for nineteen months. The patient still lives upon it to-day (November 25). John R. Connor, M.A., Vicar of St. George's, Wellington, Shropshire, writes to us:—"When labouring under severe indigestion from weakness of heart, without appetite or strength, dropy in my legs and atrophy in my system, given over by my medical friends, your Koumiss was prescribed. In two I found my appetite was restored, in a week I ceased to waste and wither, and now I am in excellent health."

Forwarded, gratis, numerous medical testimonials and reports of cases from the "Lancet" and "British Medical Journal," &c., together with prices and particulars on Koumiss Extract for export, and Sparkling Mineral as a table beverage. Our Koumiss, sold at less than half the price of Maria's Koumiss, through all Chemists.

## APOLLINARIS

## CABINET MINISTERS ON IRELAND.

IF Lord HARTINGTON is not, like Sir W. HARCOURT, a born and trained orator, he has become by practice an advocate of considerable skill. In the earlier part of his speech at Blackburn he replied, not without plausibility or force, to many hostile comments on the foreign policy of his party in and out of office. It happened that about the same time his colleague, speaking at Derby, supplied the most appropriate comment on Lord HARTINGTON's elaborate argument: "I will not," said Sir W. HARCOURT, "take you back again on that long and weary journey over the mountains of Afghanistan, or the sands of South Africa, or the frontiers of Greece, or the Balkan Peninsula. If the people of England have not made up their minds on these subjects, I do not think they are ever likely to do so." Lord HARTINGTON had prudently kept clear of the sands of South Africa, if indeed the Transvaal is sandy. It was morally and politically easier to climb, in a rhetorical sense, the mountains of Afghanistan, and to explore the frontiers of Greece, or traverse the Balkan Peninsula. Whether or not the people of England have made up their minds on these points, they have dismissed the subject from their thoughts; but possibly Lord HARTINGTON may have done some service to his cause by reminding his constituents, for the twentieth time, that he and his colleague have always been in the right. It is wholly by accident that the policies of the late and present Government have become respectively associated with Conservative or Liberal opinions. Lord BEACONSFIELD, who happened to be the Conservative leader, continued the system of Lord PALMERSTON, while Lord PALMERSTON's official and political successor entirely reversed the traditional policy of the Liberal party. In choosing between two bodies of statesmen, it is reasonable to judge their personal merits in part by the soundness of their doctrines of foreign policy; but the sands of Africa and the mountains of Asia are equally irrelevant to the legislative and administrative measures which ought to be applied to Ireland. On the only question which at present excites general interest neither Lord HARTINGTON nor Sir W. HARCOURT contributed much information; but there was a marked distinction in the tone and manner in which they respectively approached the subject.

Sir W. HARCOURT, in his long and able speech, carefully avoided all reference to the defiance of the law which prevails in a great part of Ireland. It may not be the fault of the Government that it is unable to establish order; but to the Government and to the nation at large it is the gravest of misfortunes. In estimating unprecedented experiments in remedial legislation, it is, above all things, urgent to inquire whether they have succeeded. Sir W. HARCOURT paid a well-deserved tribute to the courage and perseverance of Mr. FORSTER; but there is reason to fear that it will be necessary to arm the Irish Government with additional powers. A year ago it was understood that the Cabinet deliberately withheld from the CHIEF SECRETARY means of protecting peace and property which he had demanded as necessary or desirable. During the Session of Parliament the Land League was allowed, with almost entire impunity, to establish its tyranny in every part of Ireland. Both Lord HARTINGTON and Sir W. HARCOURT twit the late Government with the fact that the Land League was already organized before the change of Administration; but the

future supremacy which it was to attain had not then been foreseen by either party. At the time of the general election Mr. GLADSTONE for his own purposes asserted that, in consequence of the operation of his Land Act of 1870, Ireland was unprecedentedly tranquil and contented. When Lord BEACONSFIELD about the same time, in his letter to the Duke of MARLBOROUGH, indicated the approach of danger, he was assailed with a storm of ridicule and invective. Sir W. HARCOURT blames the late Government for not introducing a Land Act, forgetting that, as the Duke of ARGYLL stated, the incoming Cabinet had not included a Land Act in its list of necessary measures. Both Ministers prudently abstain from mentioning the Disturbance Bill, which contributed, by the introduction and by the defeat of the measure, to promote agrarian agitation. Lord HARTINGTON alone thinks it necessary to account for the prolonged toleration of violence and disorder.

It may perhaps be true that the present unanimity of the Liberal party is in some degree attributable to the ostentatious reluctance with which the Government used its powers for the maintenance of peace. According to Lord HARTINGTON, the Irish party of revolution would, if the Government had acted more readily, "have been reinforced by a large contingent of opinion and sympathy in England." The conjecture may perhaps be well founded; but it is not complimentary to the advanced section of the Liberal party. According to Lord HARTINGTON, the extreme Radicals were too blind to anticipate the necessary consequences of inaction, or too factious to aid the Government in guarding against imminent danger. It will not be forgotten that Mr. CHAMBERLAIN made a wholly different apology for the long-suffering of the Government. The Land League, with all its atrocities, was in his opinion a legitimate and useful organization, because it exercised pressure on Parliament to pass the Land Bill. When its task was accomplished it incurred the penalty of suppression, not as a murderous and predatory conspiracy, but because it thwarted Mr. GLADSTONE in the further development of the policy which it had before facilitated. It would seem that Mr. CHAMBERLAIN is one of the Liberal section which would, in Lord HARTINGTON's judgment, have supplied a contingent to the party of Irish revolution. Sir W. HARCOURT, perhaps, thought it better to abstain from a defence of conduct which could not be completely vindicated. He failed to observe that his exaggerated charge against the late Government involved the admission that the present Ministers were to blame for not attempting to suppress or restrain the Land League. If Lord BEACONSFIELD ought to have nipped it in the bud, when Mr. GLADSTONE was boasting of the tranquillity of Ireland, it would seem that his successors were not justified in acquiescing in its full-grown enormity, either on Mr. CHAMBERLAIN's or on Lord HARTINGTON's alleged grounds of toleration. It is true that Mr. PARNELL and his associates from the first avowed their purpose of prohibiting the payment of rent, or of arbitrarily limiting its amount; but it was impossible to foresee that their mandates would be generally obeyed, or that they would inspire universal terror. The atrocious practice of "Boycotting" had not been invented when the agitation was in bud.

It is in speaking of the administration of the Land Act that Lord HARTINGTON and Sir W. HARCOURT part company.

No one, however, Sir W. HARCOURT occasionally favours a special spoliation; but he rashly identifies the interpretation of the Act which was throughout debated in the House of Commons earnestly repudiated by the promoters of the Bill. Mr. Gladstone said over and over again that liberal landlords who were, as he truly declared, the vast majority of the whole number, would not be injured by the assessment of a fair rent. The Sub-Commissioners have so far made reductions which, if all rents are dealt with in a similar manner, will involve a reduction of the whole rental of Ireland twenty or thirty per cent. It is of course possible that, as Lord HASTINGTON hypothetically suggests, the worst cases may have been tried first; but there is no reason to suppose that the Sub-Commissioners have dealt with exceptional instances of injustice on the part of landlords. Some of them have, with imprudent parity, propounded declines which could only be held by violent partisans. One lay judge held that the valuation of land ought to be reduced in proportion to the badness of the tenant's farming; another declared his intention of disregarding the evidence of paid valuers; and the presiding lawyers have more than once announced their intention of being guided by the opinion of their colleagues, who, at the same time witnesses and judges, are not checked by opposing testimony or by cross-examination. Justice O'HAGAN himself caused just and general alarm by announcing that rent must be so adjusted as to enable the tenant to live and thrive on the farm. Sir W. HARCOURT assumes that the judgments of the Sub-Commissioners are equitable, and he consequently affirms that the only spoliation in question is that which has been applied to the tenant. Lord HASTINGTON is more discreet in reminding adverse critics that the decisions which have caused so much indignation are subject to review by the Chief Commissioners, and that "we are not yet in possession of such full and detailed information as to the evidence on which they have proceeded, and the principles by which they have been guided, as to enable us to form an opinion or a final judgment on their proceedings." In the same spirit judges are accustomed to tell juries that they must not be influenced by popular rumour, but must suspend their judgments until they have heard the evidence. It is not even certain that the reports of speeches delivered by the Sub-Commissioners, for the apparent purpose of eliciting the applause which is said to have followed, are altogether accurate. Lord HASTINGTON can only hope that ordinary cases will not hereafter "show a reduction of nearly so great a character as those of which we have lately read." There can be no doubt that Lord HASTINGTON shares the dissatisfaction and uneasiness with which the proceedings of the Sub-Commissioners have been generally regarded. Sir W. HARCOURT might, perhaps, with advantage to the cause which he supports, have declined to apologize for decisions which at first sight appear monstrous perversions of justice. His assumption that the judgments delivered are just would be cruel to the sufferers if it were not merely thoughtless. It would have been still more convenient if he and Lord HASTINGTON had not found it necessary to gratify their constituents by the delivery of party speeches. The growing nuisance of provincial oratory throws an additional difficulty in the way of considering any question with reference to its merits or to the public interest.

#### PRINCE BISMARCK.

IF the opening days of the new German Parliament have been stormy, they have been instructive. Prince BISMARCK has taken the earliest opportunity to define his object, his principles, and his creed. His object is to maintain the unity of the German Empire; his principles are still based on the conviction that the German Empire is founded on force, and must be maintained by force; his creed is that he believes, as every great man believes, in himself. The main objection to all he says is not that these statements are in any way untrue. The German Empire exists, and every German question must be subordinated to the supreme question whether what is proposed tends to strengthen the Empire or to weaken it. It is undeniable that the Empire was founded on force, and must be maintained by force. It was blood and iron, not enlightened opinion, that triumphed at Sedan and Gravelotte. Prince Bismarck directed this force, made

the Empire, and ordered for the new Empire a commanding position in Europe. The weak point in his statement is that if dealt rather with a glorious past than with a disturbed present and a future that inspires grave anxiety. The Germans have got their Empire, and are, on the whole, very pleased with it; but they are by no means satisfied with the form it has assumed. It is too Prussian, too bureaucratic, too imperious, too arbitrary. It threatens to become the Empire not of Germans, but of Prussians, of Prince BISMARCK, of petty sovereigns bowing at the feet of the Hohenzollerns. The Empire was made by force, and as against outside enemies it must be sustained by force, always ready to act, and to act with efficiency. But, if it is added that it must be internally sustained by force, if all Germany and everything German is to be under the rule of the Emperor, the army, and Prince BISMARCK; then Germans naturally ask whether this is the German Empire that was promised them, which they aided in establishing, and which they fondly hoped they had secured. Prince BISMARCK converted them to the belief that force was an indispensable means to an end; but they never understood, and would be most reluctant to own, that force was to be the end as well as the means, and that they were always to be under the discipline of the camp. Then, nothing can be stronger than the personal position of the Prince. He made the Empire, and he made it powerful; and his past successes have been so great that it is not wonderful to find him claiming a right to be considered beforehand as sure of success in everything he undertakes. He is extremely dictatorial and often wantonly offensive; but his arrogance, and even his petulance, evidently spring from a profound conviction that he alone possesses a master-mind, and that he is thinking of great things while his adversaries are thinking of small things. His hearers are compelled to admire, if they cannot forgive, and are as much overawed as they are alienated. But the more Prince BISMARCK magnifies his personal importance and his personal triumphs, the more Germany comes to think that the Empire as he conceives it is bound up with his personal existence. It may live while he lives; but it may also die when he dies. An Empire created by and for Prince BISMARCK may be buried in his grave. After him the deluge, is the thought that Prince BISMARCK breathes every hour into the minds of his countrymen; and, as they may survive to see it, they contemplate the prospect of a political deluge with considerable apprehension.

In Prince BISMARCK's conception of the German Empire there is no place for a German Parliament. He always looks facts in the face, and does not shrink from owning that a Parliament, if it is independent, is an excrescence on his general scheme. He calmly told the German Parliament that in old days he had got on perfectly well without a Prussian Parliament, and that he did not see why what had done for Prussia might not do for Germany. He and the Emperor and the army could be perfectly happy without a set of fictitious deputies sitting and chattering in a large room. His utterances were in a much milder key when he strove to point out that the new Parliament does not really represent Germany. The Liberals have, as he thinks, got more representatives than their total electoral strength justifies. If he honestly thinks so, he will be perfectly warranted in dissolving the present Parliament after giving it a fair trial. But a long Parliamentary experience enables Englishmen to say that too much importance must not be attached to electoral statistics. There is no possible system of representation in which the returns of any particular Parliament correspond precisely with the nominal strength of parties in constituencies. English Liberals are in a much larger majority at the present moment than corresponds with the balance of Liberal over Conservative voters. Success creates success, and constituencies are swept away by the tide of party triumph. Into every electoral contest, too, there is imported the dark and insupportable element of abstentions. At the recent German elections the abstentions were unusually numerous. Why were they numerous? No one, not even experienced German politicians, could give a complete answer; but one reason must have been that many who were slightly inclined to support Prince BISMARCK did not think it worth while to support him when supporting him meant taking the trouble to vote. They had no objection to

and indolence suggested that he might deserve to be supported, but that he must look out for himself; or that he was not quite clear whether he ought to be supported or not, and that he need not worry himself with the solution of a question which he had to gain, they had nothing to do but stay at home. A penal dissolution, a dissolution to punish a Parliament for existing, is always a hazardous experiment, and would be especially irritating in Germany at the present moment. For it would inevitably be coupled with Prince BISMARCK's declaration that he did not see any reason why the Empire could not be governed as well without a Parliament as with one. It would be a challenge to Germany to see whether it dared send another Parliament which would prove as satisfactory as its predecessor, and furnish an excuse for putting an end to Parliaments altogether. There is a great probability that Germany would accept the challenge, that Liberal activity would be more lively and more triumphant, and that the roll of Conservative abstentions would be increased rather than diminished. A hasty dissolution might not improbably be the means of forcing on the serious consideration of the whole nation whether it is true that a German Parliament in the present day is like the Prussian Parliament in the days before Sadowa, and can be safely reduced to being little more than an important appendage to royalty.

Whenever Prince BISMARCK makes an important statement, those who have to consider it start with two great advantages. They are sure that the speaker has a real knowledge of his subject, and they are sure that the speaker says what he really thinks. When Prince BISMARCK states that Germany would view with indifference, or at least with submission, the abrogation of its Parliament, or its reduction to the position of a Court registering the decrees of the Government, it may be taken for granted that he thinks this, and that he thinks it after a vast experience and a profound study of Germany and the Germans. All that foreign critics can do is to call to their memory the numerous instances in which great men have made great mistakes. With all his experience and all his insight, the First NAPOLEON was utterly blind to the change which French feeling had undergone in the latter years of the Empire. And there are general reasons for thinking that Prince BISMARCK is mistaken now, and special signs that Germany does not think with him, which at least deserve attention. The German Parliament binds the German people together in a way in which the Prussian Parliament did not in old days bind together the Prussian people. The German Parliament is much more than an expression of constitutionalism. It typifies not only the union, but the difference, of the different German States. It brings particularism face to face with Imperialism. It is the safety-valve of local discontent. It allows each State that yields to feel that it is yielding to the wishes of all the others. The views entertained in Germany on religion, on political economy, on the province of the State, are intimately associated with distinct localities. These localities wish their opinions to have some sort of fair play; and what they chiefly prize in the German Parliament is that it gives them an opening by which their opinions may influence all Germany. If there was no Parliament, each State would be driven back on itself. It could not help obeying the dictates of the EMPEROR and the army; but its thoughts would be concentrated on itself, or might, if taking a larger scope, be directed to the dangerous desire of getting rid of the pressure of the EMPEROR and the army. A military dictatorship, which is really what Prince BISMARCK means, might be perfectly possible in a single German State like Prussia; but it seems quite incompatible with anything like the unity of an Empire depending on the voluntary adhesion of its fractions. At any rate, there can be no doubt that not only this but every German Parliament thinks, or has thought, that its existence is a necessity, and that every attack on its proper standing must be jealously watched. Prince BISMARCK has already been defeated on a small question, but one which jarred on the susceptibilities of the Parliament. He merely asked for a trifling sum of 4,000,000 for the expenses of a Council of manufacturing and agricultural experts whom he had summoned to give him advice. The last Parliament refused the vote, and the present Parliament has repeated the refusal in a very large majority. The King, of course, or of Germany,

could not get ninety members to vote with him, because the bulk of the Chamber was determined to extinguish any attempt, however slight and indirect, to set up a Council outside Parliament, and selected not by the people, but, by the Minister. In itself the vote is unimportant. Prince BISMARCK has no more to complain of in the present Parliament than he had to complain of in the last Parliament. But the vote is important when taken in connexion with the supposed indifference of Germany to the existence and independence of its Parliament. He made a passionate appeal to his hearers to be allowed for once to have his own way in a trifling matter; but his request was summarily declined when a Parliament, freshly elected by the people thought its own dignity and independence were touched.

#### FURTHER DEGRADATION OF THE FRANCHISE.

TWO Judges of unquestionable competence have by a short and final decision effected an organic and perhaps a fatal change in the Constitution. It is to be regretted that they could not see their way to allowing an appeal from the most important act of judicial legislation which has ever nullified the intention of Parliament. The Court refused the appeal on the ground that the judges had no doubt; but the consequences of a judicial decision deserve consideration. It was a gross error in the framers of the Act to leave the Court of First Instance a discretion as to granting an appeal; but it is evident that the Act was not regarded as important. No better proof can be given of the conflict between the words as interpreted by the judges and the intention of the Legislature. It is probable that the judgment would have been sustained; but in a second and more deliberate discussion arguments might have been adduced which appear not to have been urged before Justice DENMAN and Justice BOWEN. It is a sound rule of law that the purpose of the Legislature must be exclusively collected from the words of an enactment. It is immaterial that a blunder may have been notoriously committed either by the member who has had charge of a Bill, or by the Parliamentary draftsman; but, if possible, one part of the statute law should be reconciled with another, and an interpretation consistent with common sense should be preferred where it is compatible with grammatical construction. On the other hand, Courts cannot take judicial notice of the ruinous effects which may follow from the discovery of a flaw in a legislative measure. If Justice DENMAN had been at liberty to exercise a discretion, he would probably not have swamped the existing borough constituencies and the future county constituencies by suddenly doubling their numbers. It is notorious that in 1867 both parties agreed, with more or less sincerity of conviction, on the enfranchisement of householders in boroughs. The ten pound franchise of 1832 was abolished; but, by a supplementary provision, lodgers paying 10*l.* rent for unfurnished apartments were put on the same footing with occupiers of entire houses. The privilege was evidently reasonable, inasmuch as a lodger may often be a more substantial occupier than his landlord.

The Judges have now practically determined that the lodger clauses of the Reform Act of 1867 have become inoperative and absurd. A lodger paying ten pounds of rent is entitled to the franchise, but he has equally a right to vote if he pays ten shillings or tenpence. It is true that the new franchise is only acquired by lodgers who receive no personal service in return for their rent. The distinction increases the absurdity of the enactment as it has now been interpreted. The lower class of lodgers wait on themselves, while clerks or professional men probably employ the servant of the house. That Parliament should be capable of so foolish and mischievous a paradox is surprising; but Judges cannot afford to be startled by anomalies. Almost all Liberals, including Mr. BRIGHT himself, have for thirteen or fourteen years been professedly satisfied with the borough franchise as they supposed it to exist, though they desired to extend it to the counties. They now know that they have been entirely mistaken in their complacent approval of their own legislation. Household suffrage is unmeaning and fallacious now that, according to the Judges, a room is as good as a house. By the interpreta-

tion clause of an Act of 1868 the definition of a dwelling-house settled the year before was intentionally altered. In 1867 a vote was attached to the occupation of "any part of a house occupied as a separate dwelling, and separately rated to the relief of the poor." In 1868 a vote was conferred by the occupation of "any part of a house when that part is separately occupied as a dwelling." An Act of 1869 provided that, for the purposes of any qualification or franchise dependent on payment of Poor-rate, payment by the owner should be equivalent to payment by the occupier; but it may be doubted whether any question as to rating arises under the Act of 1868. According to the judgment of the Queen's Bench Division, a room in a house becomes a dwelling-house when it is separately occupied as a dwelling. It would follow that almost every male adult who lives under a roof would be entitled to vote. It seems that some years ago Mr. CHAMBERLAIN hit the blot in the Act of 1868, for he complained in Parliament of the adherence of registering officers to the interpretation which was then universally held to be correct. His remonstrances were not successful; and the disastrous revelation which has now been made must be attributed to the astuteness of the HOME SECRETARY. In obedience to his instructions the claim was raised before one or more revising barristers; and his opinion has now been confirmed by the Queen's Bench Division.

The certainty which induced the Judges to withhold permission to appeal will not be shared by all laymen, nor even by all lawyers. It is incredible that the 10*l*. lodger franchise should not have been expressly abolished, if Parliament had intended to dispense with the renting qualification. It would also seem that the words "separately occupied as a dwelling" are not wholly exempt from ambiguity. In former times apartments under a common roof, such as chambers or flats, were for legal and Parliamentary purposes separate dwellings, if they had access to an open staircase and separate outer doors. Such tenements were rated to the relief of the poor; and it is nearly certain that the new interpretation inserted in the Act of 1868 was intended only to abolish the condition of rating. It is, therefore, possible to consider a separate dwelling as a dwelling which would formerly have been separately rated. The opposite interpretation is of course equally plausible in itself, and it is supported by the authority of the Court; but in a case of paramount importance there was perhaps sufficient doubt to justify an appeal. Twice within one year momentous consequences have followed from legislation by inadvertence. According to Mr. GLADSTONE, Irish tenants acquired a share of ownership through a mistake of his own; and it is certain that in 1870 he vehemently deprecated the logical consequences which in 1881 he attributed to his first Land Act. The practical abolition of household suffrage by an Act which has for thirteen years been entirely misunderstood is still more astonishing. There can be little doubt that the fault in the first instance lay with the Parliamentary draftsman, who must have known that the Conservative Government of 1868 could not knowingly enact what is virtually manhood suffrage. That his blunder should not have been exposed during the interval is the more surprising because three general elections have been conducted under a misinterpretation of the statute.

It is painful to reflect that only a fortnight ago limits existed which, according to the decision of the Judges, have been now removed, to absolute democratic supremacy. Some sceptical politicians hesitated to place unqualified confidence in constituencies numbered by tens of thousands; but it could not be denied that the unfittest part of the population was excluded. A householder or a ten-pound lodger is not infallible, but he has given some pledges to fortune. In a retrospective view he assumes the character of one of a select aristocracy. Perhaps he even displays rudimentary symptoms of fatty degeneration of the political heart. It would be interesting to learn whether the electors created by the Queen's Bench Division are as much superior to occupiers of entire houses as the former borough voters were superior to the educated and independent classes. The adulation which has descended with the possession of power from kings and nobles to ten-pound householders, and thence to householders in general, becomes due in turn to the occupiers of any part of a house used as a separate dwelling. The exultation even of ardent Radicals ought to be tempered by a feeling of shame for discredit incurred,

not by their party alone, but by the country. That the English nation should have no voice in determining by whom it shall be governed is a result of official and legislative ineptitude as disgraceful as it is unexpected. The realization of a revolutionary dream is effected, not by a comparison of forces, or after a prolonged struggle, but by an imbecile miscarriage in drawing a clause. The demigod in the *Odyssey* knew that he was destined to suffering and defeat, but he always expected the challenge of an enemy stronger than himself. His loss of sight was embittered by the insignificance, in his estimation, of the puny adventurer who had fulfilled the prophecy. The intelligent classes of the community, whether Conservative or Liberal, will lament the casual acquisition of supreme power by the promiscuous multitude; but enfranchisement, even when it results from deliberate legislation, is as irrevocably as the letting out of waters. It is not a small aggravation of the misfortune which has occurred that the suffrage which seems about to be extended to counties will have been previously vitiated by the degradation of the borough franchise. It would be interesting to know whether Mr. BRIGHT will welcome the irruption of the classes which he included in the residuum. Mr. GLADSTONE's opinion may be more confidently conjectured, for it must be admitted that the occupier of a room as a separate dwelling, like the compound householder of former times, possesses the qualification of common flesh and blood.

#### THE STATE OF IRELAND.

THE prorogation of Parliament until its usual time of meeting must probably be regarded as indicating that the Government have no intention of taking any definite steps in the direction of putting down the present state of anarchy in Ireland. If it be also true, as is reported, that meetings of the Cabinet are suspended for the rest of the year, this argues a still more remarkable acquiescence in the situation. The Coercion Acts of last Session can hardly be said to have failed, because they have been only very partially applied; but as a preventive or repressive measure in the hands of the present Government they have certainly not succeeded. The various measures which have been recommended for directly coping with the lawlessness in the South and West are somewhat beyond the scope of those Acts, and, whether within the theoretical competence of the Executive or not, could hardly be applied by Mr. GLADSTONE's Government without the knowledge at least of Parliament. Such measures are—the increase by considerable numbers of the Constabulary; the alteration—either by doing away with trial by jury in certain districts, and adopting the recommendations of the Lords' Committee, or by something similar—of the present method of dealing with persons suspected of agrarian crime, and some other steps of the same kind. There is no sign of such measures being likely to be actually adopted during the next two months, and it must therefore be concluded that the Government has resolved to abide by its present policy. This policy appears to be confined to the alternate arrest and discharge of suspects, and the support, where necessary, of evictions by large forces of military and police—things excellent in themselves, and which might perhaps have sufficed eighteen months ago, but obviously insufficient now.

In the audacious and paradoxical letter in which Mr. O'DONNELL endeavoured to prove a community of interest between his own party and the Tory leaders there was one point at least which has often been insisted on before, but which deserves the gravest consideration, while it is almost entirely neglected by the supporters of the Government. It is perfectly true that evictions are going on in considerable numbers, and that more may be expected, and it is equally true that the result of this is not likely to be conducive to public order. Encouraged directly by Mr. O'DONNELL's friends, and indirectly by the Government, dissatisfied with what now seems to them the meagre benefit of the Act, hundreds and thousands of tenants are refusing to pay any rent; and hundreds and thousands more are refusing to come to terms about arrears. In the former case they may lose all benefit of the Act, and in the latter their prospects are not much better. Supposing that the large reductions accorded by the Sub-Commissioners are confirmed on appeal, a time will come when the dispossessed tenants will find their neighbours

in comparative prosperity and themselves in destitution, and it cannot be doubted that a terrible ferment will ensue. Agitators are not likely to be wanting to avail themselves of this promising material, especially now that at least some prominent English Radicals have declared the severance of Ireland from England to be within the range of practical politics. The reckless folly of Sir WILFRID LAWSON would be of no moment if it had been met by his audience with any manifestations of disapproval. But Radical audiences nowadays appear to have lost the power of even comprehending the propositions made to them. That persons living within sight of the Irish Sea should cheer a suggestion involving the presence on the opposite shore of that sea, or rather strait, of an independent and hostile nation, is perhaps the most glaring example of corporate lunacy recently recorded—and that is saying a good deal. The leaders of the party have not, indeed, got to this stage; but what Sir WILFRID LAWSON thought one day Mr. GLADSTONE has before now thought the next day, and there is assuredly no guarantee in the past conduct of the present Ministry for any belief in their political steadiness. It may, however, be admitted very frankly that there is no immediate danger of any considerable number of responsible English politicians advocating the independence of Ireland. The danger is of another kind. All these reckless utterances, from Mr. GLADSTONE's own downwards, act as direct encouragements to Irish violence. The present PRIME MINISTER's recipe for disestablishing a Church was applied with remarkable rapidity and success to the process of disestablishing a landed gentry. Sir WILFRID LAWSON has recommended the same methods of flying at still higher game, and he is sure to meet with intelligent and obedient hearers. The number of outrages has already exceeded the dismal record of last year. Ireland is divided between tenants made hungrier for fresh plunder by the share already assigned to them, and tenants infuriated at having lost the chance of plunder at all by their refusal to pay rent. The most apparently trivial, and yet, under all the circumstances, one of the ugliest symptoms of all, is the systematic interference with that sport to which but a few years ago all Irishmen, from the highest to the lowest, were equally devoted. The machinations of the Land League and the supineness of the Government have, it seems, left only two passions in the Irish breast—hunger for the property of the landlords and hatred of English government. These feelings have always existed; but side by side with them other, and sometimes better, feelings have existed likewise, which seem to be now extinguished. Nothing, for instance, can be more obvious than that the old influence of the Roman Catholic clergy, which it has desperately striven to preserve by abetting the present anarchy, is gone. A priest may be cheered when he advises holding the harvest, or inveighs against Mr. FORSTER; but let him denounce murder and outrage, theft and violence, and, though it be done from the altar itself, his congregation simply refuse to listen to him.

Meanwhile what Lord HARTINGTON ingenuously calls the apparently indiscriminate reduction of rents goes on merrily. Perhaps no case has occurred which better illustrates the attitude of the Sub-Commissioners than one in the Belfast district, which is probably the only one, with the exception of the celebrated instance of Sir ORIEL FORSTER, in which a rent has actually been raised. The tenant had the use of a valuable flax mill, the property in which, and in the water which gave it its value, was unquestionably vested in the landlord. The Commissioners admitted this freely, and went on to say that, if the landlord had not said that he would be contented with a small increase, they would have raised the rent substantially. Now it must be perfectly obvious to any one who is able to attach the slightest meaning to the word "judicial" that this was a preposterous course of proceeding. Had the landlord and tenant agreed together out of court for a certain rent the Commissioners would have had nothing to do but to sanction it. But this was not the case, and the tenant having brought the landlord into court, the Commissioners had nothing left to them but to assess the "fair" rent as it seemed to them, neither less nor more, and fix it for fifteen years, leaving the landlord, if he pleased, to make a reduction of his own free will. But then this would have been to act in the ordinary fashion of a court of law, and not in the fashion of a "court of the Land League." Elsewhere the monotonous

process of cutting down has been going on, with rare exceptions of maintenance at the old rents. The tenants, we are told, are not satisfied, and it is not surprising. Even the boldest *coups* of the Sub-Commissioner who "does not care a straw for paid valuers," are insignificant and grudging, compared with Mr. PARNELL's prairie value. And yet the Commissioners are not doing the work negligently. They have provided a list of reductions which is said, though the statement is hardly credible when it is remembered that Mr. PORTER is a Law Officer of the Crown, has been placarded by the agents of his candidature for Derry and been urged by the candidate himself in his speeches as an evidence of what the Government has done and will do for the people. Considering that most, if not all, of these reductions are under appeal, and that, as each case is supposed to be judged on its merits, no one reduction can form a precedent for any other; the proceeding, if it has really taken place, may be described as one of the most indecent ever resorted to even by electioneering indiscretion. Yet more indecent, if one could for a moment believe it, would be the fact alleged that The O'DONOGHUE is about to apply for the Chiltern Hundreds "in consequence of his acceptance of the Governorship of Ceylon." After all, however, these things are only part of the system of universal bribery which, side by side with an irritating but partial and utterly ineffective coercion, constitutes Mr. GLADSTONE's policy towards the disaffected masses of Ireland.

#### THE FRENCH MINISTRY AND THE CONCORDAT.

THE theory that M. PAUL BERT owes his appointment to a momentary forgetfulness on the part of M. GAMBETTA that he would be disliked by the clergy would be disproved, if it needed disproof, by M. BERT's own action during the last ten days. His demeanour is not in the least that of a man who, finding himself in office by a lucky accident, is chiefly anxious to make the world forget that he has been put there. In less than a week M. BERT has made fifteen speeches, and there are few of them into which he has not been able to introduce something characteristic, and consequently unpleasant. His idea of his position as Minister of Worship, and still more as Minister of Education, is that of a champion who has to defend his post against attacks from every quarter. To him the Ministry of Worship is not only, or even chiefly, an administrative office. It is, as he himself has called it, a Ministry of Ecclesiastical Police. He stands to the clergy in the position in which the Minister of Justice stands to the criminal classes. Even criminals are given a certain amount of law. They are not arrested except on suspicion of having committed some specific crime, and they cannot be convicted unless this suspicion is reduced to reasonable certainty. If it is found that the law has left them too much liberty, it is the Minister's duty to propose amendments in it. The relation between the two is throughout one of measured and legal hostility. A Minister of Justice would like to make short work of the whole criminal class; but he is bound to give effect to this desire only within the limits and by the methods which the Legislature has proscribed. This is not in the least an exaggerated description of the policy which M. BERT proposes to adopt as regards the Church. As M. BERT he would like to destroy it altogether; as Minister of Worship he is bound to do it no more injury than the law allows. He cannot, however, resign himself unreservedly to this restriction. Some of the laws which now regulate the relations between the Church and the State are too monstrous to be suffered to remain on the Statute-book. When these have been repealed, and the Minister of Worship has only to guide himself by the Concordat and the organic laws annexed to the Concordat, that particular particle of tissue which stands to M. BERT in the place of a conscience will not find the duties of the office too distasteful to be gone through. After that M. BERT hints, with a kind of grim humour, the clergy may not find him as black as he has been painted. At least, if he has to make himself hateful to them, it will be rather in the capacity of Minister of Education than in that of Minister of Worship.

It is probable from the carefully considered address in which M. BERT's views were unfolded, that M. GAMBETTA means to give ecclesiastical affairs a large place in his scheme of policy. He is not prepared to go as far as M.

OLIVIEREAU and abolish the Concordat. The separation of Church and State is a measure to which he may be driven or led some day, but he does not think that things are ripe for it at present. It is not, perhaps, unfair to suspect that he looks to M. BERT's career as Minister of Education to hasten the ripening process. A French politician who contemplates the separation of Church and State has mainly to consider how the change will affect the peasantry. Its effect on the clergy need only trouble him in so far as it bears upon this larger question. The peasantry may be supposed at present to view with equal dislike the alternative of closed churches and churches kept open out of their own private purse. If they do not hear mass themselves, they like their wives to hear it, and they like to sit outside the village church while their wives are inside, in the enjoyment of a vague sense that Sunday is somehow different from other days. But these are not pleasures which they would be willing to pay for by direct contributions to the *cure*, and the only other means of retaining them is to have them paid for by the State. The Budget of Worship is not a local burden, and consequently the peasantry do not feel it, or, if they do, they are acute enough to see that there is no cheaper way of getting what they want. The Extreme Left in the Chamber, which demands the separation of Church and State, does not represent the peasantry. It is returned almost entirely by the large towns and by working-class electors. To these men the Budget of Worship is a very irritating burden indeed. As a rule, neither they nor their families ever enter a church or see a priest; and, however small may be the proportion of their total contribution to the Exchequer that goes to pay the clergy, it is nevertheless larger than they like it to be. M. GAMBETTA, though he would like to conciliate this latter section of the electorate if he could, knows that the peasantry are, in the long run, the more important element. By giving M. BERT the double office he now holds, he may hope to soothe the working-class electors for the moment, and to initiate a process by which the peasantry may by degrees be brought to the same wholesome way of thinking. As Minister of Worship M. BERT will say and do showy things against the Church. As Minister of Education his aim will be to have as many children as possible brought up without any religion. It has already been remarked that the proportion of First Communions to scholars throughout France has of late begun to decrease, the explanation being that, under the old system, when the *cure* was free of the communal school, and when the teacher was virtually his subordinate, the children were prepared for First Communion as a matter of course. Now the priest can only enter the school on certain fixed days, and, when he is there, can only give religious instruction to such children as choose to come to him. Even this permission is likely to be withdrawn under the new Government, and then the priest will have to take his chance of inducing the children to come to the church for religious instruction. Unless the clergy are able by means of some new, and at present improbable, awakening of religious enthusiasm to make head against these obstacles, the decay of religion in France is likely to be general. What religion there is may be more genuine, but there will be very much less of what goes by the name of religion. M. GAMBETTA may look forward to a time when those who are now the children of the peasantry will have become the peasantry, and he may hope that, under this new secular training, they will have lost the languid preference they now feel for having a *cure* paid by the State established in every village. In that enlightened time the abolition of the Concordat will be a universally popular measure.

The materials on which to found a conclusion as to the degree in which those speculations are likely to be realized do not exist; but there is no imprudence in saying that the position of the French Church in relation to the State has been greatly changed by M. GAMBETTA's accession to power. All former Governments that have been set up since the conclusion of the Concordat have regarded the Church as in some sort an ally. Even M. FERRY, though he dispersed the religious orders, was—in words, at all events—friendly to the secular clergy. The Church has often been treated as an ally upon whom it was necessary to keep a very sharp watch, but she has never been ranked among the avowed enemies of the Government. This, however, is plainly to be her position in the future. The Concordat, as M. BERT proposes to carry it out, will be simply an

agreement concluded for specific purposes between two honourable adversaries. What is written in it in black and white will be executed to the letter, but the Church will get nothing that is not written in it. If she makes a slip in her dealings with the Government, and either oversteps her own assigned province or withholds from the State something to which it has a claim, every advantage will be taken of the blunder. It is the declared object of the new Government to lessen her influence in the country, and the only promise that M. BERT will give is that he will pursue this object without either violence or worrying. But, as M. BERT's reason for avoiding these methods is merely that the one is odious and the other ridiculous, the Church has nothing to thank him for. He would be defeating his own end if he condescended to employ either. Violence would turn the clergy into martyrs; worrying would make them respectable by the side of those who worried them; and both these results would just serve the Church's purpose. M. BERT does not wish to see any genuine tears shed on behalf of the clergy, or any genuine laughter excited against the Government, and his apparent moderation is merely due to his determination to do his work thoroughly. It will be seen, therefore, that the circumstances in which the French clergy are now placed are full of serious moment. The Republic has at last measured herself against the Church, and the ultimate consequences of the conflict thus begun are very hard to estimate. The position of the Church under the Concordat will henceforward be very much worse than it was at the time the Concordat was signed. In 1801 it represented an arrangement into which the ruler of France thought it expedient to enter; in 1881 it is an arrangement from which the ruler of France does not think it expedient to withdraw. In 1801 it was a bargain by which Church and State alike hoped to be gainers; in 1881 it is a bargain which the State declares not to be at all a good one, and which it is consequently sure to interpret in the narrowest possible spirit. M. GAMBETTA may be the gainer, from his own point of view, by thus dealing with the Church; but, if so, he must be acting on grounds which he has not disclosed to the world when to all appearance it is his interest to do so, and which have, to say the least, no *a priori* probability. If the Church were the dangerous and irreconcilable enemy of the Republic, it might be prudent thus to take her by the throat. But if left to herself she would be neither dangerous nor irreconcilable; and if the one way in which she can by possibility be made dangerous is by first making her irreconcilable, the wisdom of M. GAMBETTA's course is certainly not apparent. Until M. FERRY entered upon the road on which M. GAMBETTA seems to intend to travel at a very much faster pace, the French Catholics were the enemies of the Republic in so far, but in so far only, as they were Royalists or Bonapartists. Under the present system they will have no choice but to be the enemies of the Republic in so far as they are Catholics. M. GAMBETTA is minded to improve upon his conduct of the war in the autumn of 1870. Then he called legions as from the earth to defend the Republic; now he calls legions as from the earth to attack it.

#### PRIVATE BILLS FOR 1882.

THE list of private Bills for next Session is a very long one, and in this long list there are some of exceptional importance. The railway Bills are fifty per cent. more, and the miscellaneous Bills are thirty per cent. more, than were submitted to Parliament last Session. The increase is greatly due to reviving trade, to the accumulation of capital, and, above all, to a reviving spirit of enterprise. But, so far as the projected railways can be taken to indicate the general character of the enterprise which is now longing to manifest itself, it cannot be said that, apart from the metropolis and the neighbourhood of the metropolis, there is anything to be seen but a very natural expansion of the means of local communication. All the large railways have, as usual, Bills for extending the accommodation they offer to the public. This is inevitable. Every year brings new wants, and new wants can only be met by an annual increase of powers. Minor lines in their turn wish to create new feeders, or to vary slightly the direction in which parts of them run, or are intended to run, or to resume the construction of works which have in the time of depression

been standing still for want of funds. The lines that propose to occupy new ground are not very numerous or important except in the North, and for the most part are cross lines to connect two points of the large systems, or are intended to open up new sources of agricultural produce for the large towns. The projects for London and its vicinity can alone be called ambitious. The Regent's Canal is to offer a line from Paddington by the Zoological Gardens to the Victoria Docks. There is to be a gigantic outside railway going in a circle through the outlying suburbs on the northern side of the Thames, and offering twenty-four miles of a connected line. There is a project which, if carried out, would be most acceptable to a large portion of the public, by which the South-Western would be brought from the remote and inconvenient station of Waterloo into the City near Queen Street. Further, there is a design which will fill London with much wonder and, perhaps, some alarm. It is that of a railway on the pneumatic principle from Uxbridge Road to the Minories, with a slight offshoot from Oxford Street to South Kensington. The London extension of the South-Eastern, although only an increase of existing accommodation, is on such a scale, and will require such a very large outlay, that it deserves to rank separately as a great metropolitan work. Some of these great metropolitan schemes are perhaps premature, and the pneumatic line is, to say the least, very ambitious. But, on the whole, it may be said that they are legitimate attempts to accommodate traffic which is known to exist, or which it may reasonably be said will exist before long; and the outlay, large as it would be, would not absorb any serious portion of the available capital of the country. There is very little in the railway schemes of the coming Session that bears any analogy to the feverish adventures of 1845. Railways were not understood then, and they are understood now. Experience has amply proved that very great works may be now undertaken with a fair chance of the moderate rate of profit that at present contents investors.

It is outside of railways that the most adventurous and startling schemes have been set on foot. The proposed increase of dock accommodation is absolutely necessary to meet the growing wants of a nation which has got the larger share of the carrying trade of the world into its hands, and is obliged to use larger and larger vessels to carry it quickly and cheaply. There are, for example, to be large extensions of the East and West India Docks, and of the Victoria Docks; Workington is to offer new docks to the adjacent mineral districts, and Dartmouth Harbour is to have its capacities of usefulness greatly enlarged. The latest discovery of practical science endeavours to find an ample field for its operations, and at least three Electric Companies ask for extensive powers to tear up streets, fix posts, buy land, and supply any district that may be fixed on with endless electric power, not only for heating, lighting, and motive purposes, but for any other purpose to which it may be hereafter found that the power is applicable. The peculiar wants of London also receive special attention, and one inland fish market is to be created on the northern and another on the southern side of the water. The Government, again, seeks to acquire extensive sites for the convenient housing of the Admiralty and the War Office, and we are taken into a very high region of soaring adventure when we find that Parliament is to be asked to sanction the construction of the railways that are to serve as approaches to the English end of the Channel Tunnel. With the exception, however, of the last scheme, which raises grave national questions, all the foregoing schemes are more or less within the proper region of finance. The main question they raise is, whether it is or is not desirable that Parliament should or should not allow compulsory powers to be given by which promoters will be enabled to insist on the public trying very costly experiments. The Docks and the Fish Markets may in themselves be good or bad schemes, but they are designed to satisfy recognized public wants. The desirableness of permitting electricity, in the present stage of its advance to perfection, to be the subject of experiments on a gigantic scale is a matter on which some doubt may be fairly entertained. But there can be no doubt that some day or other electricity will be allowed to have a trial on any scale that may be desired, and a Parliamentary Committee is perhaps as good a tribunal as could be selected to decide whether the time has already arrived. A Committee is sure to be fair, and not very likely to be rash, and is perhaps

more likely to take into account the claims of conflicting interests than any other tribunal that could be devised. It may also be remarked that the general character of the schemes of this year is not such as to inspire much hope that any extension of local self-government would greatly relieve Parliament of its work in discussing private Bills. There are, no doubt, many small railway projects, intended to meet local wants, which might be satisfactorily dealt with by local bodies. But they are precisely the schemes which, comparatively speaking, are unimportant and excite no general interest. We are carried into a very different region when we come to conflicting schemes for getting hold of a great mineral district, for constructing gigantic docks, for arranging the railway communications of a town with four millions of inhabitants, or for putting every street or every town at the disposal of electrical patents.

There still remains a class of the new schemes which deserves to be considered apart. This class has little to do with finance, and its chief characteristic is that grave public questions are being sought to be solved by the machinery of private Bills. First, there is the Channel Tunnel scheme, which certainly is, from a financial point of view, a very great scheme, but the financial importance of which is as nothing by the side of the national importance of the issues whether the Government ought to allow the tunnel to be made, and, if it ought, what control it should retain over the tunnel. It is true that all that is now asked is power to make the approaches to the tunnel; but in a military sense it is the approaches that are of supreme importance, and Parliament cannot allow the approaches to be made and then refuse to allow the tunnel itself to be constructed. As another instance of the class may be mentioned the Thames Conservancy Bill. This Bill is a regulative Bill, and its regulative force is wonderfully extensive. It proposes to give the Conservators arbitrary and indefinite authority to determine every point as to every craft that uses the waters of the Thames—its size, speed, lights, where it may land, and what it is to be bound to do under every conceivable circumstance. It may be necessary that some body should have these despotic powers, and the Conservators may be a body that can be safely entrusted with them. But whether these powers should be given and to whom they should be entrusted is a public rather than a private question. Of the same character is the Buildings Bill of the Metropolitan Board of Works. The Bill gives the Board complete jurisdiction over all the buildings of the metropolis. The Board is to be able to see not only how buildings are built, but what line they are to follow; to decide, irrespectively of the rights of ownership, whether they may protrude beyond the line or not; to appropriate for the public the vacant ground when they are set back; and to pull down buildings unfit for human habitation, to clear the space and to charge the owner of the soil with the cost of clearance. That greater powers of supervising buildings should be given to some one may be conceded; but to define these powers, and to give them to one Board, is a great public act, and is scarcely within the scope of a private Bill. Much more is this the case with a gigantic and most adventurous scheme for getting hold of every charity of every City parish, and putting those charities, which, as stated in the Bill, are some hundreds in number, at the disposal of a body of trustees created according to the fancies of the promoters. Nothing can be more bewildering than to find that such a wholesale handling of charitable property should be considered to be within the scope of a private Bill. To deal with hundreds of charities; to override the intentions of founders; to accommodate, when necessary, old benefactions to modern uses, is the business of Government and of Parliament as a whole, and not that of a Committee or of fanciful promoters. It was not for purposes of this kind that Parliament delegated its powers to Select Committees; and it is scarcely too much to say that it is a sort of fraud on Parliament that Select Committees should be invited to pass such large public measures in the disguise of private Bills.

#### NEW APPLICATIONS OF THE MONROE DOCTRINE.

IT will perhaps be unnecessary to engage for the present in any controversy with the United States on recent attempts to extend the so-called Monroe doctrine. Mr. BLAINE, who issued the Circular on the Panama Canal,

is about to retire from the Cabinet, and, although his successor is not likely to retract any pretension which may have been advanced, he may perhaps not care again to raise by anticipation a doubtful issue. It is nevertheless necessary to remember that the claim of exclusive rights over the Canal was first made by Mr. EVARTS during the Presidency of Mr. HAYES. There can be no doubt that the same policy will be at least tacitly maintained, or that it will be revived as soon as the Canal is ready for use. One of Mr. BLAINE's arguments admits of a conclusive answer. He relies on a treaty between the United States and the Republic of Columbia which, according to his contention, renders unnecessary any guarantee on the part of European Powers. The treaty which bears the names of Mr. CLAYTON, Secretary of State, and of Sir HENRY BULWER, then English Minister at Washington, of later date than the Columbian Treaty, expressly provides for a joint guarantee of any inter-oceanic canal which may at any future time be made. It is impossible to prevent a State from propounding demands which it may in its own opinion have power to enforce; but the exclusive control by the United States of the North and South American continents, with the adjacent seas, had never any foundation in international law; and in this particular case it directly conflicts with the provisions of the CLAYTON-BULWER Treaty. The formal right of guaranteeing the neutrality of the Canal may be of secondary importance; for the free passage of armed vessels in time of war would, in spite of conventions or of the common law of nations, depend on the naval and military power of the belligerents. It is also improbable that any Power would guarantee the free passage of the Canal for warlike purposes. The chief danger to be apprehended from the establishment of an exclusive American protectorate is that the commerce of other countries might become subject to differential rates. The Columbian Government will readily agree to the imposition of limited and equal rates on commerce which it will have an interest in fostering. It would be impossible to allow to the Government of the United States a right of prohibiting any convention of the kind.

A writer in the *North American Review* who has held a diplomatic post improves on Mr. BLAINE's interpretation of the MONROE doctrine. According to Mr. KASSON, a member of Congress, and formerly United States Minister to Austria, the rights of transit through the Panama Canal are to be exclusively subject to the authority of the United States, with the nominal sanction of the Columbian Government. For the purpose of laying a foundation for an extravagant claim, Mr. KASSON coolly describes the Canal as "the connecting water-line between our Atlantic and Pacific coasts." That it will also become the connecting water-line between Europe and the North and South Pacific is a circumstance too trivial to mention. As a New York paper observes, the Canal is separated by hundreds of miles of ocean from any coast on either side of the Continent over which the United States have jurisdiction. The Canal will also form a connexion between the Atlantic and Pacific ports of the Dominion of Canada, and between the West Indies and Australia. That it should already be regarded as a part of the American coast-line is significant, if not alarming. It is highly probable that in the Panama Canal, as in the Suez Canal, English tonnage would exceed that of America, and perhaps of all nations. As if to illustrate the cynical injustice of the MONROE doctrine in its latest version, Mr. KASSON declares that the Panama Canal must be no more under European control than the Pacific railroad, of which every part is within the territory of the Union. His claim therefore is one, not of free passage, or even of exclusive right of diplomatic contract, but of absolute sovereignty. The Government and Legislature of the United States might, if it were thought desirable, lawfully exclude foreigners and their goods from the use of the Pacific Railway. It is by no means certain that if the present claim were admitted they would not establish for American citizens a monopoly of transit by the Canal. It is true that Mr. KASSON writes without authority; but the gloss which he supplies to Mr. BLAINE's circular despatch suggests a careful examination into the meaning of the text.

In one part of his despatch Mr. BLAINE refers to the abstinence of his Government from any claim to share in the control exercised by the European Powers over interests in Europe and Asia with which they are concerned. In the similar case of the Suez Canal no dispute

has yet arisen as to the rights of all Powers to free passage both in peace and war. The English Government has more than once informally announced that it will, if necessary, maintain to the utmost of its power the right of free passage for its troops between Europe and India. Its right to keep open the passage of the Canal really depends on its paramount interest, though Lord BEACONSFIELD, with statesmanlike foresight, strengthened the equitable position of the English Government by the purchase of a large portion of the stock of the Canal Company. It is certain that, if England were engaged in war extending to the Levant, the free use of the Canal would depend neither on treaties nor on guarantees, but on material force. It was as a precaution against such difficulties that Lord PALMERSTON, with sound judgment of national interests, though perhaps in undue disregard of cosmopolitan interests, consistently opposed the construction of the Suez Canal. The engineers who asserted that the Canal could not be made merely supplied him with arguments for discouraging the scheme. If Lord PALMERSTON had relied implicitly on their judgment he would not have troubled himself to thwart an impracticable enterprise. The American Government prudently declines to interfere in remote complications; but, if a differential duty were imposed by the Suez Company on American shipping or freight, the neutrality of the United States would be immediately interrupted. If commercial equality is secured in the Panama Canal for the trade of all nations, the United States will have little difficulty in maintaining political preponderance.

A still more recent corollary has been deduced from the MONROE doctrine by Mr. HURLBUT, American Minister to Peru; but the authority on which he professes to act is disputed by his colleague in Chili, and it is not yet known whether the Government at Washington sustains Mr. HURLBUT's policy. If the Ministers have acted on conflicting instructions, Mr. BLAINE will be responsible for a grave official and diplomatic miscarriage. Notwithstanding the crushing defeat of the Peruvian forces, and the long-continued occupation of the capital by the Chilean army, the United States Government has recognized Señor CALDERON as President of Peru. His predecessor fled from Lima on the approach of the enemy, and he is said, after maintaining desultory warfare for a time, to have left the country for Europe. Mr. HURLBUT lately addressed a communication to the Chilean commander at Lima to the effect that the American Government would regard with displeasure the permanent annexation to Chili of the whole or any part of the territory of Peru. On receiving the despatch, the Chilean Government applied to the American Minister at Santiago, who in answer formally repudiated any intention on the part of his Government to interfere in the quarrel. Not being, as it would seem, satisfied with the assurance of the Minister, the Chilean authorities have since arrested President CALDERON, and sent him in captivity to Santiago. It is possible that the American Government may regard the arrest as an affront to itself, though it would seem to be a legitimate act of war. Some writers assert that the seizure of the Peruvian President would have been resented but for the sufficient reason that there was no American ironclad on the coast. Whatever may be the result of proceedings which have perhaps not been accurately reported, there is happily no reason to fear that England will be involved in any dispute which may arise. The American Government, if it demands the release of the Peruvian President, or if it insists on controlling the territorial arrangements which may result from the war, will act in virtue of superior power rather than in assertion of any international right. England has no interest either in the dismemberment of Peru or in the extreme assertion of the rights of conquest. If the American Government persuades or compels the Chileans to be moderate it will probably do them a service.

#### MORE VACATION SPEECHES.

EVERYBODY who has read LUCRETIVS, with a great many people who have not, knows the famous description of the atom-drifts pelting through space, nowhence and nowhither. The comparison has no doubt been applied before to the pitiless storm of extra-Parliamentary oratory; but it is certainly applicable afresh now. Every week the competition of speakers grows hotter, and every week that very competition leaves less to say.

Since last Saturday there has been an especial pressure of deliverances, many of which before a score or so of hours have passed are as last year's snow. Among them, however, there are one or two which really deserve exemption from the general law of the dust-heap, and among these the first place must certainly be assigned to Mr. GOSCHEN's address at Rugby. Mr. GOSCHEN was in more respects than one lucky. He had an admirable foil provided for him in the shape of a member of Parliament whose name is known only to his brother lawyers and to diligent students of DOD, and who was good enough to append to Mr. GOSCHEN's thoughtful and original speech a *cola* of the usual adulation of Mr. GLADSTONE and the usual out-and-dried party common-places. Without Mr. BUSZARD Mr. GOSCHEN would still have been remarkable, but he would not have been nearly so remarkable. For it might have been forgotten how far the party to which he belongs has strayed from its original ways. There was a time when a Liberal, whatever might be the rectitude or obliquity of his general political views, was emphatically a person who thought for himself. There is no room now for any one who thinks for himself in the ranks of the Liberal party, and it is fortunate if a few persons like Mr. GOSCHEN are allowed a kind of unattached position in gratitude for past services and in hope of future subservience. To pass from Mr. GOSCHEN's atmosphere to Mr. BUSZARD's is very much like an experience of *RIP VAN WINKLE*; there is no need to describe the sensations of the later stage; the earlier is at any rate invigorating. Devoting himself, for the most part, to the subject of local government (not without certain very definite allusions, not over-complimentary in character, to the necessity of a "strong Executive"), Mr. GOSCHEN took occasion to sketch plans of reform in county administration, which may or may not be approved in detail, but which are evidently poles asunder from any likely to be proposed by the Government in which Mr. GLADSTONE and Mr. CHAMBERLAIN are the two Kings of Brontford. Probably no worse service to his party could have been done than the reference to a former proposal which Mr. GOSCHEN gave us dating from 1871. That measure was by no means one to be accepted without criticism and alteration. But, at least as Mr. GOSCHEN described it at Rugby, it seems to the reader of 1881 to have somehow come from another sphere—to be a kind of Saturn and Jupiter Bill compared with the projects of to-day. "What! a fight! and nobody killed?" says a character in a novel of the last generation. "A Bill! and nobody robbed?" is the natural and irrepressible parody which rises to the lips of Mr. GOSCHEN's hearers now. To the scheme of direct county government by the elected of the ratepayers, which Mr. GOSCHEN suggests, it is easy to make some grave objections, not the least of which has been anticipated, but certainly not answered, by the suggestor himself in the remark that his own objection to the extension of the Parliamentary suffrage is not affected by his now proposal. But from this scheme, as well as from the scheme of parochial Boards, which, after Mr. ALBERT GREY, Mr. GOSCHEN supports, and from his eminently just and sensible views on the readjustment of local burdens, there is equally absent "the note of confiscation and revolution which every measure carried by the present Government has borne. There was room, too, for the protest—not now heard for the first time—which Mr. GOSCHEN made against the bewildering multiplication of Government interferences which is gradually sapping the healthy civic and social life of England. Indeed the whole speech may be said to have been a distinctly audible and distinctly intelligible reminder of the difference between Radicalism and Liberalism. There must have been many readers, as there were probably some hearers, of Mr. GOSCHEN's speech who were half rejoiced and half grieved at this glimpse of the days that are apparently no more—the days when Liberal and Conservative differed rather about means than ends, and could therefore mutually respect each other. When the historian comes to write the history of the present day he will not distinguish English politicians into Whigs and Tories, but simply into destructives and anti-destructives. Oddly enough, on this present occasion the two classes were represented by members of the same party, as parties went not so many years ago.

The analogy which has been drawn between Mr. GOSCHEN and Lord CARNARVON is somewhat superficial; but, as analogies go in these days, it will perhaps serve. Both

have proved their independence (Lord CARNARVON more strikingly, if less wisely, than Mr. GOSCHEN) at considerable inconvenience to themselves; yet there is not a breath which rests on the party loyalty of either, the insinuation of a morning journal that office might have bought over Lord CARNARVON to Liberalism being simply gratuitous impertinence. From the nature of the case Lord CARNARVON is not quite so much detached from his own party as Mr. GOSCHEN from his. The point on which the one differed was a point of accidental occurrence which is now past. The point on which the other practically holds himself aloof is yet a burning question, is entirely unsolved, and is one which holds a foremost place in the nominal programme of the party leaders. It is therefore impossible for Mr. GOSCHEN to take up the cudgels against all and sundry for his party, while no such disability rests on Lord CARNARVON. The chapter of his dissidence with former colleagues is closed, and that of his agreement fully reopened. The result is a speech in a livelier and more pugnacious vein than is usual with Lord CARNARVON. The Hampshire Conservatives who listened to him at Portsmouth on Wednesday must have felt that they had ware for their money. But, at the same time, the speech, though excellent of its kind, scarcely has the general interest of Mr. GOSCHEN's. It was a capital example of polemics; the kind of speech which benefits, and is intended to benefit, not the comparatively impartial student of politics, but the local politician. It is by speeches such as that of Lord CARNARVON that Governments are in the long run upset or established, not so much from their intrinsic weight as from their inspiring effect on the divisions of the combatant army. Not many speeches of the kind lately have been better than this, which strikes out for its author something of a new line. Unreasonable as the lavishing of such speeches may seem to be to persons who are well acquainted with political facts and deductions, there is no doubt that in the altered conditions of the electorate they are in a manner necessary. They do not conduce greatly to a clear and unbiassed judgment of the subject; but the immense majority of those who are called on to decide are incapable, and of the minority a large majority are impatient, of any such clear comprehension. Into such minds the nail must be driven when and where the opportunity offers, and, great as the sacrifice may be to the speakers, and tiresome as the result of that sacrifice may be to some hearers and readers, it must be acquiesced in. It was a fair jest of Sir W. HARCOURT's that his adversaries had come to the conclusion that the last election was won by much speaking, and had determined to repeat the process. But, like many jests, it covered a fact tending to refute the intended inference of the jestor.

One curious deliverance, proceeding from a very near relative of Lord CARNARVON's, deserves to be noticed in conclusion. Mr. AUBERON HERBERT, after a rather eccentric course in politics, appears to have definitely settled down into the position of a *vox clamans in deserto*, for the warning, if it be possible, of an erring Liberal party. The latest subjects of Mr. HERBERT's cries in the wilderness are the Farmers' Alliance and peasant-proprietorship. The former body supplies him with the occasion of much true, if not exactly new, reflection; to the latter he looks forward with a sanguine cheerfulness sufficient to save him from the charge of being a mere pessimist bemoaning his lost illusions about Mr. GLADSTONE. It is true that persons not unworthy of credence tell us that, if the peasant-proprietor were to reappear in England, the same causes which have banished him would make him a miserable creature, dragging on, by the help of money-lenders, a precarious existence, until some future Mr. GLADSTONE helped him by legislation. Still, the belief in the peasant-proprietor is a pleasant positive relief and lining to the negative gloom of Mr. HERBERT's present political creed. That everybody is trying to get something without paying for it; that all Liberal statesmen (except Mr. GOSCHEN) are endeavouring to help everybody in his laudable enterprise; that politicians like to take small steps in the direction of larger propositions so as to involve the acceptance of the latter without responsibility, and other things of the same kind, are the conclusions to which Mr. HERBERT's recent political studies have led him. The most unfortunate part of the matter is that there is a very great amount of truth in all this, though Mr. HERBERT has perhaps been a little late in perceiving it.

## VOLUNTARY SCHOOLS AND THE PROPOSED EDUCATION CODE.

IT is not every subject or every occasion that takes the Archbishop of CANTERBURY to a Government Department. He is too great a personage for his aid to be lightly or often invoked. The proposed Education Code may claim, therefore, among the other triumphs it has already won, that it has brought his Grace from Lambeth to Westminster, and engaged him in a close examination of that mysterious formula about which so much has been said and so little is certainly known. The case which the ARCHBISHOP laid before the LORD PRESIDENT and the VICE-PRESIDENT on Wednesday was simply this. The National Society, of which the Archbishop of CANTERBURY is the official President, has been the means of keeping alive a great number of voluntary schools in all parts of the country. As the representative of the subscribers to Church schools, the Society may be said to contribute between 500,000*l.* and 600,000*l.* yearly to the support of elementary education. Besides this, not less than 12½ millions have been laid out on school buildings, of which about 4 millions have been spent since 1870. The friends of voluntary schools may therefore claim to have given substantial proofs of their earnestness in the matter. They have not offered to the public that which cost them nothing. The part which these schools play in the education of the country is fully proportionate to the money expended. The elementary schools in England and Wales provide in all 4,240,000 school places, of which 2,327,000 are provided in Church schools. Thus more than half the whole school accommodation is furnished by the schools whose cause the Archbishop of CANTERBURY pleaded on Wednesday. Of the children actually on the school registers more than two millions are in Church schools, against something over half that number in Board schools. Nor is the education given in these schools at all inadequate to the requirements of the Government. The National Society can appeal to the reports of the Government Inspectors for proof to the contrary. The Church schools hold their own with any in the kingdom. The position, therefore, of the supporters of these schools is that they do a double public service. They educate a large number of children, and they do this at no cost to the ratepayers. If every Church school in the kingdom were closed, the number of School Boards would have to be greatly increased, accommodation provided for two million more children, and an additional half million of money be extracted every year from the ratepayers. The ARCHBISHOP did not profess any general hostility to the proposed code. Some of the changes he admitted to be good; but he is afraid that the result of these changes, taken in conjunction with the intended alterations in the mode of calculating payment for the work done, will be to throw a large additional outlay upon the Church schools. The regulations in the existing code with regard to teaching, to the number of teachers to be maintained in each school, and to the apparatus required for teaching, cannot be improved, as the new code proposes to improve them, without considerable outlay. If the old methods of calculating payment for work done were to remain in force, the managers of Church schools might hope to recoup themselves by the larger grants earned. But it is not at all certain that, under the new code, the existing grants will not be cut down; so that the managers may find themselves in the position of men called on to do their work more efficiently out of diminished means for doing it. From this point of view the Archbishop of CANTERBURY was able to speak as indirectly the representative of other bodies than the National Society. Other voluntary schools are afraid that their finances will be seriously crippled by the new regulations. In these schools eight hundred thousand children—not much short of half the number in the Board schools—are receiving instruction. The changes which are expected to do harm to Church schools will do equal or greater harm to these other voluntary schools. Thus, supposing the new code to make in favour of Board schools and against voluntary schools, it will improve the education given to a million children at the expense of the education given to nearly three million children.

It will be admitted that the case thus stated by the Archbishop of CANTERBURY is a strong one. The schools maintained by School Boards stand in a wholly different position as regards money from those maintained by voluntary contributions. All elementary schools are in part

maintained by Government grants, and in part by the children's pence. The difference between them has reference to the source from which the deficiency in the money thus obtained is to be made good. In the case of voluntary schools this source is the subscriptions of persons interested in their maintenance; in the case of School Board schools it is the rates. The rates have the advantage over subscriptions of being inexhaustible. Supposing that the Education Department insist on more money being spent on teachers and apparatus, the School Boards have no difficulty in meeting the demand. They can make as large a call on the rates as is necessary for the purpose, and they have not even the trouble of collecting it. The Vestry has to find the money and to make its peace with the ratepayers. If the school rate all over the country were fourfold or tenfold what it is now, School Boards could smile serenely on the local tempest which the demand would create, and plead that it had to meet the requirements of the Education Department or consent to forego all share in the Parliamentary grant. The managers of voluntary schools have nothing to fall back upon except the liberality of persons who, in many instances, are more and more taxed for the support of School Board schools. If they cannot induce their subscribers to increase their contributions in proportion to the new outlay that has to be provided, they must be content to see their present income getting smaller from the steady decline of the grant, owing to their inability to conform to the conditions on which a share in it depends. If it were only the disappointment of school managers that was involved in the discouragement of voluntary schools, it might be argued that this ought not to be set against the improvement of elementary education. If the voluntary schools cannot give as good an education as Board schools, they must go to the wall. There would be a good deal to be said on the other side even upon this view of the case, but it is unnecessary to say it, because there is very much more than the disappointment of school managers involved. School Boards are not so universally popular, nor is the zeal for paying an increased school rate so passionate, as to make it a matter of no importance whether voluntary schools are injured or held harmless. The true way to take in the meaning of a change is to see how it would work if pushed to its extreme limits. The closing of a voluntary school here and there would matter nothing, except to the ratepayers of that particular parish. But the closing of voluntary schools generally would inflict a very serious burden on the community, and in the end be extremely detrimental to elementary education. The children now in elementary schools must have schools and teachers provided for them, and it would be no slight demand upon the various School Boards to have to educate nearly four where they now have to educate only one. Even if we suppose that by the removal of overlapping schools the children were educated more cheaply under School Boards than in voluntary schools—an assumption for which there is at present very little foundation—the additional drain upon the ratepayers would be very large. When once the voluntary schools were out of the way, one of the principal motives for keeping the School Board schools in a state of thorough efficiency would be gone. There would be no competition, and consequently no shame in earning but a small part of the possible grant. Any decline in the grant, however, would be only temporary, inasmuch as the School Boards, having only their own schools to consider, would bring pressure to bear upon the Education department to induce it to lower its standard so as to make things pleasant for the ratepayers. The ultimate result would be that the country would spend more money than it spends now and get a poorer education in return for it. It would be an exceedingly short-sighted policy on the part of the friends of elementary education to do anything which should leave School Board schools in entire possession of the educational field. The pressure brought upon the School Boards by the ratepayers, and upon the Government by the School Board, to lower the standard of education in place of increasing the cost would soon become irresistible. The rivalry between the two classes of schools is not without its drawbacks; but they have their standing compensation in the educational activity to which that rivalry gives birth.

The answer of the LORD PRESIDENT to the deputation was as reassuring as anything can be which has to do with a code about the working of which every one concerned, except the permanent officials of the Education

Department, is in complete ignorance. Are the fears of the managers of voluntary schools well or ill founded? Nobody knows. Will efficient schools be able to earn as much as they earn now, or more, or less? Nobody knows. Will the changes in the teaching staff be beneficial or injurious to voluntary schools? Nobody knows. Never was there a series of proposals affecting such large pecuniary as well as other interests about which those who introduce them, and those to whose benefit or injury they are introduced, seem to be so completely in the dark. It is to be hoped that before Parliament meets the Education Department will put out an intelligible statement, showing what is the precise effect which it believes that the new code will have upon the several classes of voluntary schools. There must be an impression in the Office as to what that effect will be, and there can be no reason why this impression—which, formed as it will have been by competent experts, will furnish valuable data for forecasting the future of voluntary schools under the new code—should not at once be made public. The representatives of voluntary schools will then be able either to show cause why these impressions are to be deemed untrustworthy, or why, if they are trustworthy, the changes to which they have reference are inexpedient. It is greatly to be desired that Parliament should not, during the Session, be as much in the dark about the proposed code as nearly everybody else has been during the recess.

#### RESCUE OF MR. LEIGH SMITH

THE situation of Mr. Leigh Smith and his crew is one which cannot fail to excite the interest and compassion of his countrymen. Mr. Smith's yacht, the *Eira*, was last seen on the 8th of July, off the west coast of Nova Zembla. She was steering north, with the purpose, as is presumed, of crossing the difficult Barents Sea, of exploring Franz Josef's Land, and of pushing on, were it but for a few miles, the limit of human knowledge of the frozen North. From that date—the 8th of July—nothing whatever is known of the *Eira* and her fortunes. Mr. Leigh Smith had no thought of wintering in the Arctic regions. Even if no disaster has happened to his vessel and its crew, he will be unable to wait on board until September or even August 1882. It is almost certain that he will have to abandon the *Eira*, perhaps in May, to load his boats with provisions and all things necessary, and to make what progress to the open sea he may, by the tedious and fatiguing process of hauling the boats across floes, and of rowing when he is favoured by lanes of water. How slow, how tedious, this mode of travelling is, nay, how impossible to men worn out by an Arctic winter, we propose to show presently by the experience of the famous Austrian expedition. But it is necessary first to give some account of Mr. Leigh Smith's previous achievements and of his method of Arctic exploration.

Mr. Smith's first Arctic voyage was made in 1871, on board his yacht the *Samsøen*. His purpose, as Mr. Clements Markham says (*Threshold of the Unknown Region*), was to attain the highest possible latitude, and to explore the unknown lands to the eastward of Spitzbergen. He sailed down Hinlopen Strait in August, and reached a position which had formerly been supposed to be a peninsula. In the course of one shooting expedition, which lasted for eighteen hours, Mr. Smith walked round the "peninsula," and proved that it was, in fact, like Cape Breton, an island. He discovered, also, the eastward prolongation of North-East Land, and attained latitude  $81^{\circ} 24' N$ . In 1872 Mr. Smith's new yacht, the *Diana*, encountered much ice, and made no great progress. In 1873 he and the *Diana* were very serviceable to the Swedish Arctic expedition, which they supplied with fresh provisions. For this expedition Mr. Smith received the appropriate order of the Pole Star from the King of Sweden.

The most successful of Mr. Leigh Smith's voyages was that which he made last year, in the *Eira*, a new steam-yacht which he had built at Peterhead for the express purpose of Northern exploration. The *Eira* is 360 tons burden, and her crew, in 1880, consisted of twenty-nine men in all. Mr. W. G. A. Grant, the well-known amateur photographer of Arctic scenes, accompanied Mr. Smith, who had with him Dr. Neale, the surgeon, a master, two mates, two engineers, and twenty-one men. This year Mr. Grant has not sailed with the *Eira*, and Mr. Leigh Smith is left to the society of his surgeon, and some twenty-three whalers and mariners from Hull and Peterhead, through the dark weariness of the Arctic winter. By July 31 last year the *Eira* had rounded the south point of Spitzbergen, and Mr. Smith determined to cross the ice-laden Barents Sea to Franz Josef's Land, the country discovered by the Austrian expedition under Payer and Weyprecht. The *Eira* steamed northwards, and came on the pack on the 6th of August. On the 14th of August she reached Franz Josef's Land, proving that the route, at least in certain summers, is easily navigable. Unfortunately the condition of the ice in 1881 must have proved to be very unlike what it was in 1880, and the *Eira*, instead of outdoing her former exploit, may now be blocked up by the ice in "Eira Harbour," where she was comfortably installed last year.

Even in the expedition of 1881 there were perils enough, and Mr. Smith and Mr. Grant, with the doctor and boatswain, only reached the yacht on one occasion by jumping from one floating piece of ice to another. The zoological, geological, and botanical results of the cruise had considerable interest, and Mr. Smith demonstrated, as it appeared, that much might be done for Arctic discovery in the course of a single summer, by an explorer who understood ice-navigation and knew how to bide his time. "The extent of new coast-line discovered and explored was 110 miles, while, with the extent seen to the most distant point it was 150." The great size of the icebergs and the extent of the glaciers are supposed to indicate that Franz Josef's Land is almost continental in its proportions. Whether Mr. Smith's discoveries added at all to the reasonable hopes of reaching the Pole by this mode is a debated question on which we cannot venture to pronounce an opinion. Sir George Nares informed the Geographical Society that his own expedition had "effectually closed up Smith's Sound as a route in that direction." But Sir George Nares appeared to think that Eira Harbour, discovered by Mr. Smith, might prove a basis for an attack on the Pole made from the direction of Franz Josef's Land. However this may be, Mr. Smith's is decidedly the most meritorious expedition made in our time by private enterprise. His persistent and gallant efforts to advance geographical knowledge, and to help England in the international contest for the frosty laurels of the North, entitle him to the sympathy and the assistance which we trust that he will receive.

How great is the possible need of Mr. Smith and his crew may readily be estimated by any one who will recall the sufferings and exploits of the Austrian explorers. On the 20th of May, 1874, they abandoned their vessel in about the very place where Mr. Smith will probably be compelled to abandon the *Eira*. Mr. Smith, as we have already pointed out, had provisions with him which could hardly outlast fourteen months, and therefore he cannot afford to wait on board his yacht till September, and then steam quietly home if he is released by the breaking ice. He will be obliged to do as the Austrians did—to leave his vessel in May, and to haul his boats over the ice. Now the Austrians found that the first day's progress of twenty-three men harnessed to ropes and sledges was but one mile, and even this rate of progress was above the average. On many days they did not make half a mile of way. They were detained for long in what they called the "harbour of Aulis"—*vento retinente*, as Ovid says—and it is strange to think how the memory of some old tribal feud in prehistoric Greece has left its mark on a waste of ice and rock beyond the land of the Cimmerians. Not till June 17 did an ice-hole open, and the boats were launched only to be frozen in again. The men's privations were extreme. They lived on the fat of seals when they were lucky enough to shoot seals, on the dusty remains at the bottom of bread-barrels, on tea and tobacco. But these luxuries were soon exhausted; tobacco became the circulating medium; people paid each other for little services with a pipe of tobacco or a pannikin of water. Some men who had none of the circulating medium adopted a paper currency, and smoked brown paper. At one time the south-east wind blew so persistently that the expedition was blown and drifted due north-west, and actually lost three weeks' work. The one amusement was sleeping; dinner consisted of a cup of tea, a handful of bread-crumbs, and, on lucky days, a seal among four boats' crews. Meanwhile the labour of dragging, liting, pushing the boats, of cutting ice, of removing and reloading the packages, might have exhausted well-fed men in the perfection of training. And, after two months of this life, the distance between the boats and the deserted ship was two German miles. On the 24th of July, after more than two months' labour, rain began to fall, and the ice melted more rapidly. Might not the crews as well have waited for this favourable moment in the ship? Not till the 7th of August did the boats begin to make progress at the rate of twelve miles a day. Now August was well advanced, only a month's provisions remained, and still the open sea was not reached. Who can think without emotion that in August 1882 Mr. Smith and his men may be precisely in this strait? And, even when the sea lay free and open to the Austrians, on the 15th of August, they had a long uncertain cruise to make in open boats, with a barren and deserted shore in front of them. When Nova Zembla was reached, their perils were not over. They might find no ship there, they might be forced on the desperate venture of crossing the White Sea, direct to Lapland, a distance of 450 miles. On this occasion, as every one knows, Fortune did not desert the brave, and they fell in with a hospitable Russian vessel, when they could sleep undisturbed by the fear of being starved to death in the end.

"Truly," says Homer, "every shape of death is hateful to wretched men; but to die of hunger, and so meet doom, is the most terrible death of all." Surely we cannot endure to leave the lives of the crew of the *Eira* to chance, or to the best-directed of private enterprises. The Barents Sea, as Mr. Valentine Smith says in his letter on the subject to the Geographical Society, will not next summer be wholly deserted. The Dutch will make a fifth voyage there with the *William Barents*, and Sir Henry Gore Booth intends to go there in a small sailing vessel. But sailing vessels, as Mr. Valentine Smith says, cannot make an effective search, nor do much more than skirt the outer edges of the ice. "A well-equipped and ably-commanded steamer can alone meet the requirements of the case. . . . It would probably be desirable to leave a *dépôt* on Cape Nassau, with a large

and conspicuous cairn," such as men might see from open boats afloat between the ice and the coast of Nova Zembla. Eira Harbour should also be visited as early as may be. Mr. Leigh Smith has given money and time and labour to the cause of science, and, for the credit of a seafaring nation, we trust that Government will think that such services, and such an example of energy and fortitude, merit recognition, and that the crew of the *Eira* deserve to be sought for and rescued, not less than the whalers after whom Sir James Ross was despatched in the *Cove*. The nature of Mr. Leigh Smith's position is the most impressive that can appeal to the imagination.

ἔχρη' δῖστος, ἀνυστος,

he has gone out of all men's sight and hearing, and is left to combat with such enemies as cold and hunger, and the night. That he and his men will overcome them, we most heartily hope; but they need such assistance as surely they will receive from their country.

#### CHURCH PARTIES PAST AND PRESENT.

IT was not a bad idea of Mr. Benham's to give us, in the new number of *Macmillan's Magazine*, a sketch of "Church Controversies during the last fifty years," the date being of course fixed so as just to anticipate the beginning of the Tractarian movement. But his manner of executing the design leaves us much to desiderate. Mr. Benham writes apparently from the standpoint of a moderate and liberal-minded Broad Churchman—we agree with him that the term is too vague and comprehensive to be a very satisfactory one—and is evidently anxious to be fair both to High Churchmen and Evangelicals, though his appreciation of their respective principles, the former especially, does not appear to be more than superficial. But his paper has none of the picturesque interest of the brilliant though very one-sided sketch of Tractarianism lately contributed by Mr. Froude to *Good Words*, and does not even attempt to emulate the historical and ethical coherence of Mr. Gladstone's paper on Church parties in the *British Quarterly* two or three years ago. We have successive glimpses of the old Evangelicals, the Tractarians, the Broad Church, and the modern Ritualists, but of any moral or logical sequence of these various phases of thought and their relation to each other we are told almost nothing; even the notorious and significant fact, which Mr. Gladstone has dwelt upon, that nearly all the original Tractarians—the exceptions can be counted on the fingers of one hand—began life as Evangelicals, is not so much as touched upon. After this it is not surprising to find the writer so vague and unsuggestive as he is in drawing the moral of his tale. Beyond a strong conviction that disestablishment would be "a frightful calamity," and that it is imminent if the present strain continues much longer, that Bibliolatry and idolatry of the Church are equally false and ineffective, and that "young High Church zealots" are very foolish persons, he really has nothing to tell us of the future—except indeed that "there is a possible future before the Church of England," if only the clergy will follow the advice given by St. Peter to those of his own day. That does not seem a very helpful or adequate solution of the problems raised by the controversies of the last fifty years. On one point indeed Mr. Benham had intended to give some advice, but there was no space for it, and that is on preaching. We are the less tempted however to regret the omission as his indictment against modern preachers generally is so very indiscriminate, and the models he proposes for imitation in the past are so little suited to present exigencies, that our confidence in the value of his counsels is not extreme. His view of isolated facts is often an odd one, as will presently appear, and of their mutual relations he does not offer any view at all, except in one case, where his theory of the development of ideas is still more peculiar. *Post hoc, propter hoc* is no doubt an exploded fallacy in logic, but nevertheless historical events, and not least in religious history, have a sequence of causation as well as of time. Nor can any predictions or warnings about the future be of much service which are not based on a careful appreciation of the growth of ideas and institutions in the past.

Mr. Benham begins by observing that fifty years ago, towards the close of Charles Simcoe's life, the Evangelical party had lost its first fervour and had patched up a sort of Concordat or armistice with the high and dry or "old port-wine" school. That is true, but it is an awkward way of putting it, to say that "the old Evangelicals had been violently anti-Erastian; the new ones looked coldly on the Dissenters." Of Erastianism the old Evangelicals knew little and thought less. They fraternized readily with their "dear Dissenting brethren," not because they were jealous of State interference in religion, but because they recognized no special sacredness or obligation in one form of ecclesiastical polity more than another. It is true also that the *Tracts for the Times* were started with the view of showing that the Church does not depend on civil authority; but here again it is quite out of place to charge the authors with inconsistency in taking up "the old Puritan idea" on one point while they denounced Puritanism in nearly all other respects. The "idea" was much older than Puritanism, being avowedly borrowed from the ancient Church, which in this one respect Puritanism, when confronted with Popish or prelatic Governments, had found it convenient to emulate. But whatever were the motives of the Tractarians, an outcry was at once

raised against them on the score that "they were leading a movement which would land us in the Church of Rome." And although all of them, and especially "the chief writer," indignantly denied the charge, he and many of his allies eventually justified it, by their conduct. The fact of course is so, but it is strange logic to argue that the Homeward tendency of the Tract movement was "demonstrated" by the publication of Tract XC. or by its author's secession; it would be just as logical to argue that its anti-Roman tendency was demonstrated by Dr. Pusey's declining to follow him. This reference to Tract XC. illustrates also Mr. Benham's queer way of looking at facts. Its republication some few years ago by Dr. Pusey made no more fuss, Mr. Benham tells us, than is caused by the reappearance of a polemical tract of Milton or Tom Paine. "It is interesting as a literary curiosity; no one adopts its principle, *certainly not the editor*." The notion of Dr. Pusey undertaking the editorship of literary curiosities is sufficiently amusing; in his reissue of Tract XC. he was careful to explain that he published it with a very practical object—to which Dr. Newman also referred in his Letter to him—and that he did very distinctly "adopt its principle." Mr. Benham is not equally incorrect in refurbishing the favourite Broad Church boast—which is reiterated with a persistency that forcibly reminds one of a familiar copybook sentence about "self-praise"—that the voice of each of the liberal leaders was raised on behalf of the much-abused Tract writers in the midst of the clamour against them. He specifies four of these chivalrous apologists—Thirlwall, Maurice, Hare, and Stanley—and even of them this can only be predicated with considerable reserve; that others quite as prominent then on the same side—e.g. the present Archbishop of Canterbury, and Mr. Wilson the *Essayist and Reviewer*—took a prominent part in creating the clamour he omits to mention. The somewhat vacillating line taken, "not with very happy results," by Bishop Blomfield—on whose zeal, ability, and high character he pronounces a just encomium—is described by Mr. Benham fairly enough. On the one hand he approved and encouraged the attack on Tract XC.; on the other he delivered a Charge condemning indeed some "Romish novelties" now commonly seen in even Evangelical churches, such as flowers on the altars, but directing certain changes in divine service, such as preaching in the surplice, which were then considered so ultra-ritualistic (the word was not then in use) that their introduction according to the *Times* compelled conscientious worshippers to turn aside with tears from the pews where their fathers and grandfathers had knelt—we mean sat—before them, and the graves where their bones reposed. But when the Islington clergy refused to obey these injunctions the Bishop somewhat abruptly withdrew them, and threw over those who had got into trouble by too ready a compliance with his orders. He was a high-principled and well-meaning man who imperfectly discerned the signs of the times.

In his comments on the literature of the movement Mr. Benham is not happy. He admits, what is certainly the fact, that, while in a numerical minority, the Tractarians had the learning and literary power on their side, but he chiefly dwells on one very subordinate branch of this literature, the religious novel, in which he thinks they misused their gifts. We are not prepared to defend everything in Mr. Paget's extremely amusing tales, but they do not deserve the severe censure here pronounced upon them, which moreover applies really to this method of conducting controversy rather than to any particular examples of it. The controversial novel, in whatever interest it may be written—whether Roman, Anglican, Protestant, or even, like some of the most attractive of those stories, designed to illustrate the contrast between the early Christians and their heathen persecutors—is always and inevitably more or less unfair. We have a distinct recollection of a Broad Church novel by the late Mr. Conybeare, called *Perversion*, far more objectionable than any tale of Mr. Paget's, and our readers may remember a grossly offensive specimen of the same kind of anti-ritualist fiction reviewed some months ago in our own columns. As to theological controversy, properly so called, Mr. Benham seems to be possessed with the essentially shallow and arrogant notion, which does not say very much for his own acquaintance with theology, that all good men at bottom think just the same, only they do not know it. The difference between Dr. Pusey and Bishop Ryle on baptismal regeneration is simply "a question of terminology"; "there is no practical difference between them," which means, we suppose, that Dr. Pusey would agree with Bishop Ryle on the importance of carefully training a baptized child, and not merely trusting for its Christian steadfastness to the fact that it has been christened. If the remark means this it is an obvious truism; if it means anything more it is untrue. Bishop Ryle might with equal justice be said "practically" to agree with Cardinal Manning about Transubstantiation. Then we are told that "the late Professor Mozley, being called upon to write down Mr. Gorham, but bringing a cool head and warm heart to bear upon the question, ended by writing in his defence." In the first place Professor Mozley, if we may trust his own account of the matter, was not "called upon to write down Mr. Gorham," but took up the question to satisfy his own mind; in the next place he was only led to defend Mr. Gorham's views through his adopting a theory of predestination which by no means commends itself to every one with a cool head and warm heart, and is repudiated by almost every High Churchman who values consistency of thought. Dr. Pusey is altogether rather hardly dealt with in this paper; he is the lay figure constantly trotted out by Mr. Benham to illustrate his

somewhat paradoxical crotchets. Not only does he devote himself to editing literary curiosities, and "practically" agree with Bishop Ryle about the doctrine of baptism. He also "practically" agrees with Dr. Farrar about eternal punishment, which again can only mean, if it means anything, that they would both alike exhort sinners to repentance in this world, however they may differ as to the consequences of sin in the next. The late Dean Mansel in another way has still harder measure dealt him. He is saddled, on account of his Hampton Lectures, with the sole and actual paternity of "what is known as Agnosticism," and this too is the solitary instance in the controversies of the last fifty years where Mr. Benham professes to recognize anything like a progressive sequence of ideas. Dr. Mansel's theory of the "limits of religious thought" has always appeared to us a very questionable one, but to say that it has proved historically the only or chief cause of the recent outbreak of Agnosticism, even if—which we do not ourselves believe—it has had anything whatever to do with the matter, is simply ridiculous; the explanation of that phase of modern unbelief is not far to seek, nor is it made any easier by retailing some irrelevant nonsense about the donkey that drank up the moon.

We cannot follow Mr. Benham through his rambling comments on Bishop Colenso's affair, further than to notice that he again betrays his characteristic inaccuracy of thought when he says of the Bishop of Capetown's action in the matter—in language studiously borrowed from one of the most unpleasant of the *Ingoldsby Legends*—"Who is one penny the worse for his sentence of deposition and of the greater excommunication?" It was an attempt to suppress by force what hundreds and thousands were seeking and trying to get to the bottom of, and his attempt was hopeless. Certainly if anybody out of Colney Hatch had been silly enough to make such an attempt it must have proved hopeless enough. But it is one thing to endeavour to suppress by force the investigation of critical difficulties in the Bible, quite another thing to decide that a person who has arrived at the particular solution of them maintained by Dr. Colenso is not fit to hold high office in the Church, and—with all deference to the superior wisdom of Mr. Benham and "the jackdaw of Rheims"—Bishop Gray was not at all singular in judging that the latter point should be decided in the negative. Lastly we are brought to "the Ritualistic quarrel," but whether this quarrel has in any way risen out of the Tractarian movement, or has any sort of connexion with it, no hint is vouchsafed. To do the writer justice, he speaks in warm, almost enthusiastic terms of the good work done among the poorest of the poor by such men as "Mr. Macconochie and Messrs. Green and Knaght," and still more by "good Charles Lowder," whom he knew personally. On the other hand, the Evangelicals are summarily informed—which will not quite please them—that "their old belief in 'an infallible Book' will not do. The Book is not infallible." But then the Ritualists "are utterly unreasonable in refusing to obey anybody," and exploding the old Tractarian principle that the final authority is the Bishop. That is too wide a question to enter upon here, but one concluding remark will not be out of place. Whether the Ritualist position is a tenable one in itself is a point fairly open to discussion, but that is not the question raised here. And assuming—what of course must be assumed in advising the Ritualists on the rightness or wrongness of this or that detail of their conduct—that their fundamental contention against the binding authority of Lord Penzance and the Privy Council is defensible, we do not see much reason or justice in blaming them for declining to accept injunctions which are "practically"—to use Mr. Benham's favourite phrase—a mere conscious echo of that rejected authority, even though clothed in the form of an episcopal "admonition," and promulgated amid the solemnities of an extemporized clerical assembly dignified, rather on the *lucus a non lucendo* principle, with the name of a Diocesan Synod. But if it is unfair to condemn the Ritualists for refusing to bow to the *ipse dixit* of individual Bishops, there is more force in Mr. Benham's humorous exposure of the infallible pretensions of the "newspaper pope" to whose edicts they are sometimes too ready to succumb. Nobody familiar with that department of journalism is likely to mistake the organ not inaptly indicated in the following passage:—

In our day, an invisible pope summons all classes to his tribunal, and absolves any one of them, whether bishop, priest, or layman, from any obligation whatever, on his own sovereign authority. Maurice said so long ago, but since then this pope too has made fresh canons of his infallibility. And this pope is—the editor of the religious newspaper. The young priest disobeys and insults his bishop, sets the law of the land at defiance, scorns such insignificant dunces as Lords Selborne and Hatherley, will put his trust in nobody but the newspaper pope. You buy your pope's weekly bulls with the same instinct that a London rough looks on at a street fight—a cruel instinct. You want to see whom your pope calls "Raca" this week, and whom "Moreh." For the pope delights in cursing—it is his livelihood; and it is he if any who will bring the Church of England to ruin.

#### IMPRISONMENT FOR BRIBERY.

THE severe sentences passed last Tuesday on the persons convicted of bribery at Sandwich and Macclesfield may not improbably have an effect somewhat different from that which appears to have been anticipated by the judges who passed them. Their object seems to have been to affirm in some decided and startling manner the principle that the law does regard bribery as a serious offence, and so to convert public opinion and encourage juries to convict. According to general experience, the proceeding is

likely to act rather in an opposite direction. Juries will probably be rather more than less reluctant to convict when they are aware of the results of conviction. This, however, is, it may be admitted, not a very important consideration, inasmuch as it can hardly be more difficult to obtain convictions in these cases than it is at present. Supposing that severity is really justifiable, there might be some reason for contending that, when the law catches a specimen of a class of criminals particularly hard to catch, it will do well to make an example of him. An example has certainly been made of the unfortunates whom their own ill-luck and the adroit management of the Commissioners has exposed to the clutches of the law. Three solicitors, all men of high standing and position in their respective societies, have been condemned to terms of imprisonment varying from six to nine months, without any of the indulgences usually accorded to persons of their class who have been convicted of what may be called artificial crimes—crimes, that is to say, which are the creation of statute rather than of the moral law. A coach proprietor, who, as a Town Councillor of Sandwich, must be presumed to be of respectable station, also has six months, and shorter terms are assigned to half a dozen other persons. The most remarkable point of the judgment, perhaps, is that the aggravated enormity which procured the sentence of nine months upon Messrs. May and Mair of Macclesfield seems to have been that they had taken counsel's opinion as to the legality of the course they pursued, and had received an answer favourable to that course.

The speech in which Mr. Justice Denman passed sentence ignores the main reasons which lie at the root of the general reluctance to see sentences of this kind inflicted. Very few people, we suppose, have any abstract sympathy with or approval of bribery, though paradoxes here and there have been started—more in jest than in earnest—to defend it. But there is felt to be, in the first place, a good deal of cant about the objections usually made to the practice; and, in the second place, it is, we believe, felt still more widely that such victims as those of Tuesday are emphatically the wrong men in the wrong place. Their office is little more than ministerial; they are simply middle terms between the candidate who is willing to spend on an election sums of money which he knows perfectly well can by no possibility be honestly spent, and the voters who are not merely willing to receive, but who insist on receiving, money for their votes. It is on this last point especially that the cant just mentioned is wont to lavish itself. The wicked bribing agent is represented as going about tempting poor, but previously honest, voters with his infernal gold. As every one knows who knows anything of elections, nothing can be less like the fact. With very rare exceptions, the bribe is a man who has made up his mind to be bribed. His attitude is precisely that of the Bridgewater elector who was canvassed by the late Mr. Bagshot. "I won't vote for gentlesfolks unless they does something for I." Yet the law hardly troubles itself at all about the corrupt voter, while it visits Mr. May and his fellows with about the same punishment as would be inflicted on a wife-beater who had not quite killed a woman. In the same way the candidate, even though his intentions may be obviously and transparently corrupt, gets off with nothing worse than a partial and temporary disability. This is certainly not even-handed justice, and it is all the less even-handed because the classes who are exposed to punishment get punished in the most haphazard way. A mere glance at the reports of the Election Commissions will show that there were scores and hundreds of agents and sub-agents in exactly the same boat with Messrs. May, Mair, and Edwards. It so happened, however, that their evidence was necessary to the Commissioners, and so they got their certificates of indemnity. There is something revolting to an ordinary sense of justice in such a state of things—a state in which the mere caprice of Commissioners in refusing to call a man may subject him to severe and even ruinous punishment. But, independently of the sense of justice, there is the expediency of the matter to be considered. There is no triter saying about punishment, and none better founded, than the saying that to be effective it may be heavy or light, but should be as certain as possible. So long as the criminal can say to himself that there are a hundred chances in his favour and only one against him, no severity of the improbable penalty will deter him. Now the chances of punishment to any individual briber are exceedingly small; indeed, by the exercise of a little ingenuity, he can practically do away with them altogether. If he is caught, it must be owing either to his own imprudence, or to the treachery of others who are bribed to incriminate him by receiving immunity themselves. The present system of obtaining convictions for bribery may be said to be a vast manufacture of king's evidence, in which, some hundreds or thousands of persons having conspired to commit an offence, the great majority are bribed by a free pardon to supply the necessary testimony for the conviction of the infinitesimal minority. It is the knowledge of all this, and not any sympathy with corrupt practices which makes those Sandwich and Macclesfield unfortunates objects of compassion. In the first place, they are not the really guilty parties; and, in the second, if they are guilty at all, they are only unlucky individuals of a vast class.

These points are all the better worth considering because of the present Attorney-General's threatened change of whips for scorpions in this matter of bribery. When the rules of Parliament have been altered, and the English tenant-farmers presented with various undefined boons, and the Bankruptcy laws set aside

once for all, and county government revolutionized, and the labourer enfranchised, and a few other trifling *boulversements* of the British Constitution effected, Sir Henry James is going to make matters much more unpleasant for bribers. It remains to be seen whether such an alteration of the law would be of any effect. It is, to say the least, not probable. Bribery is an ugly weed, but one of very hardy growth, so long as the actual soil in which it grows—the willingness of voters to be bribed—is not affected, and it is not quite clear how this is to be done by more severity to agents. The increase of the constituencies and the magic of the Ballot were to do away with it. It is now notorious that they have not done anything of the kind; on the contrary, the Ballot Act is the very Magna Charta of the corrupt voter, securing to him the formerly impossible privilege of receiving bribes from both parties at once. As for the increase of the electorate, the sole result has been to diminish the price of individual votes, and to make the "boss" system for which the Caucus arrangements of Mr. Schnadhorst and his friends give every facility both necessary and imminent. Nor is it at all probable that the plan of shutting up in prison an old gentleman of sixty-three who, relying on the law, has told the truth freely, but has put himself in the power of the Commissioners by a mistake or an equivocation on a single unimportant point, will be any more successful. For, as has been already pointed out, the most likely result of this severity will simply be an increased reluctance to convict on the part of juries, if not a possible reaction of public feeling against criminal proceedings for bribery altogether.

The truth is that nothing can be more clumsy or less equitable than the present legal methods of dealing with bribery. They punish the wrong persons, and they punish them in the wrong sort of way. There can be nothing more prejudicial to that "conscience of the nation" of which we hear so much nowadays than the creation of artificial crimes and the confusion of different kinds of culpability by the infliction of an identical punishment, unless perhaps it be the infliction of punishment in the uneven and haphazard manner which, as has been shown, is a necessary incident of the present law of Election Commissions and trials. In all cases the first thing to do is to proportion the penalty to the offence; and, as it happens, this is particularly easy to do in the case of bribery. If it were the custom, not, according to the present rather irrational rule, to disfranchise a constituency for ever for the fault of one generation, but to suspend its franchise for five, ten, or twenty years, and then restore it during good behaviour; if candidates proved guilty of bribery were rendered incapable of sitting in Parliament (the present theory of agency being of course modified) for a longer or shorter period; if agents detected in the same practice were made incapable of serving anywhere in the same capacity without vitiating the election; and, finally, if every person proved to have been bribed were struck off the register, as much would have been done to check bribery as can reasonably be done, and probably far more than is done under the present mixture of coaxing for confessions and punishing for not having had the chance of confessing. For, if people would clear their minds of cant about bribery, they would see that the reason for objecting to it is simply that, in conceivable cases, it might prevent the State from being served in Parliament by the best man. The agent or the candidate who buys votes disturbs the judgment of the constituency in selecting the best man; the voter who sells them announces that he does not care about using that judgment. The appropriate punishment, therefore, is, in the first place, to disqualify the man who solicits votes for money; in the second, to disfranchise the persons who are false to their trust, and who show themselves open to this manner of soliciting. Beyond this the State can have no possible reason for going, and by going beyond this it simply defeats its own intentions. The weapon of disability or disfranchisement is easily used; it is perfectly equitable in its operation; it is not likely to be interfered with by sympathy with the victims; and, best of all, it is absolutely effectual. No other weapon unites these advantages, or even most of them; certainly that at present in use does not. For, when the House of Commons is at last stirred up to disfranchise a borough, what happens? The corrupt voters simply swell the county constituency—an arrangement perhaps as ludicrous in its anomaly as any to be found, even in English politics. It is, of course, in the highest degree desirable that so severe a punishment as disfranchisement should not be used indiscriminately, and perhaps that it should never be used without allowing a *locus penitentiae*. But, with obvious safeguards, it might be made thoroughly workable as applied to individuals, to parts of constituencies—for very often one ward in a town is utterly corrupt when the next is not corrupt at all—and to constituencies *en bloc*. Imprisonment for bribery has none of these advantages. When public opinion holds it disgraceful to bribe, as it already holds it disgraceful to be bribed, bribery will cease; but that state of public opinion will not be brought about by the haphazard infliction of a clearly incongruous punishment.

#### TATTOOING.

IN the sacred interests of science we have paid a somewhat disappointing visit to the Westminster Aquarium. The enterprising Mr. Farini had advertised his possession of two priceless anthropological phenomena—"a noble Greek" and "a Leopard Boy"—and his intention to exhibit them to the curious and contemplative. We do not pretend to take much interest in the spotted boy, even if he is a mulatto who has come out in spots

instead of a uniform yellow. But the noble Greek is a more interesting person. This nobleman is reported to have been tattooed in more than three hundred places by the Chinese Tartars. These ferocious monsters, for political reasons, are said to have completely covered the Hellenic frame of the Greek with beautifully delineated figures of beasts, birds, fishes, reptiles, and quadrupeds. If we may judge by the coloured advertisements, the Chinese Tartars tattoo very much in the style of old Persian carpets. We are, unluckily, obliged to judge by coloured advertisements only, for the noble Greek did not appear when we went to his room in the Aquarium. One old gentleman and a little boy shared our poignant disappointment, though we waited on the victim of Tartar cruelty at the very hour when, according to the advertisements, he exhibits himself to the inquiring eyes of anthropologists and the general public. We can therefore only place our trust in a document signed by Mr. O. W. Holmes, declaring that the noble Greek is "remarkable as combining in one exhibition a picture gallery, a menagerie of strange animals, and a proof of how much suffering man can inflict on man endure." Mr. Farini offers a reward of 10,000*l.* for the correct deciphering of the tattooed hieroglyphs. Here is a chance for Ilittite and Etruscan students. Mr. Farini does not say who is to be umpire as to the correctness of the decipherment, but no doubt the editors of the sporting papers will kindly act as referees. Meanwhile, we are compelled to fall back on the topic of tattooing in general, after admitting, on very eminent authority, that the noble Greek is the best tattooed European alive.

Tattooing, or at least tattooing as practised by uncivilized men, is an art without a history. No one, as far as we are aware, has made it the business of his life to study the development of tattooing from its rude beginnings to the consummate forms which we are invited to admire in the person of the noble Greek. We have not, therefore, the materials at hand for a really scientific discussion of the evolution of "moko," as the New Zealanders call tattooing. As science becomes more thoroughly differentiated, and as specialists arise in this branch of learning, we shall, doubtless, have books written on Mokology. This seems the most appropriate term for the new study, because it sounds tautological to talk of tattooology. In the course of a few years we may believe that conferences of Mokologists will be held in September in the larger and more intellectual provincial towns. In the meantime we venture to offer a few remarks of our own on this obscure topic.

The origin of tattooing is, doubtless, the same as the origin of whittling—namely, pure brainless indolence. But while the civilized Yankee merely whittles at his chair, his table, or a piece of soft wood, the untutored and childish savage naturally preferred whittling at his fellow-creatures. He saw no fun in whittling at dead, unfeeling matter. The love of giving pain is one of the earliest instincts of our nature, and the practice is as agreeable to the least developed savage as to the most accomplished modern libeller. We may even regard tattooing as an upward step towards civilization. Man's very first impulse, if we may believe some speculative philosophers, was to eat his neighbours *sans phrase*. His next idea was to keep him alive, when caught, and to tattoo him, as the Chinese Tartars tattooed the noble Greek. His third idea was to use his captive as a slave. But the gulf between tattooing captives and the use of tattooing as a universal fashion is a wide one, and we must leave some future inquirer to leap across it with the conjectural agility of Mr. Herbert Spencer. There is one source of the custom of tattooing which doubtless combined with the instincts of cruelty and of decorative art, instincts that, as Mr. Ruskin says, generally go together. In the infancy of mankind, before people wore clothes, and when all men, except those who shared the same cave, were enemies, it was necessary for the different groups to have some sort of distinguishing mark. Otherwise, near relations might come to blows, and persons of the same stock might intermarry—a thing utterly repugnant to primitive morality. By way, therefore, of having some recognizable mark, people are supposed to have tattooed themselves with the effigy of some animal common in their neighbourhood, or, which was easier and simpler, with some combination of dots or lines. One set of persons was marked with the sign of the crane, another with that of the wombat, a third with the turtle. Whether this was a really primitive practice or not, it is certain that heraldic bearings of this kind are traced on the breasts of the Red Men of North America. But they are comparatively advanced savages; and, indeed, we can hardly believe that very rude tribes could draw a recognizable wombat, or a crane that might not easily be mistaken for a swan, and so lead to infringements of etiquette and morality. A man marked with the crane might marry a lady of the same mark, under the delusion that she was tattooed with the swan, and so a heinous offence against early morality might be unwittingly committed. The least developed tattooing with which we are acquainted is that of the natives of Australia. The purely decorative tattooing may be traced to the primitive stage of mere arbitrary whittling. Gentlemen of fashion have their bodies covered with huge scars in relief, scars which make no attempt to represent any object, and which are not even pretty in shape and arrangement. In Mr. Brough Smyth's *Aborigines of Australia* (vol. i. p. 11) there is a portrait of a good-looking black fellow, with scars at least an inch high all over his back. Down the spine runs a line of these scars; others appear to indicate the position of the ribs. Both men and women in Queensland get themselves marked in this way. The instrument used is a piece of broken shell, inserted in the end of the throwing-stick which is used to give velocity to the

flight of the spear. This custom must probably be the survival of some very old institution, because the Australians are capable of designing very graceful decorative patterns, such as the herring-bone, chevron, and saltire. But they keep these marks for their shields, and hack their own bodies in a rude and random fashion. In addition to the mere unmeaning scars, the different groups tattoo themselves with patterns common to the tribe. Three rows of five dots, five upright lines, and a rude curve, like an attempt to draw a boomerang, are among the recognized tribal marks. The untutored Australians find it almost impossible to draw a curve, and this naturally limits their powers of decorative design. The lower Brazilian tribes, according to Bates, are on the same artistic level as the Australians, and scar themselves with mere lines and patches. The New Zealanders, on the other hand, a much more advanced race, show us tattooing on the level of a fine art. It is impossible, without the use of illustrations, to demonstrate the richness, beauty, and variety of the New Zealand tattooing. The ornaments are the herring-bone and triangular markings; but these are subordinate to the loop-coil which winds gracefully in and out of all their ornamentations. The patterns are intricate, the lines deep, and the style bold. Ornament of the same sort is found in Borneo, and it has been suggested that the Polynesian style is really a debased form of the Asiatic. However this may be, the New Zealanders cut and carve their own skins with all the resources of their art. The "moko" is said not to constitute a mark of rank, except in so far as inability to pay the *mokoists* is a sign of poverty. Nor do the New Zealand tattooings indicate the differences of tribe. They appear to be merely an exhibition of human vanity, like expensive dress among clothed peoples. The men, like true savages, keep decoration as much as possible to themselves; or perhaps it would be more fair to say that the better taste of the women revolts against the practice. When Englishmen first settled in New Zealand they found that the older women had one side of their faces tattooed, so that from one point of the view they looked like men, while the other aspect of the profile revealed them as women. Now the women tattoo only the lines of the lips and a scroll depending from the angles of the mouth. They also draw fine blue lines on their arms and breasts. The practice of the New Zealanders shows us tattooing as no longer a torture or a kind of trade-mark, but merely a form of personal ornament.

It is in this shape that tattooing survives among the savage and backward classes of civilized peoples, among boys, criminals, and the lower class of soldiers. This modern tattooing has recently been made the subject of special studies, both in France and Italy. Soldiers are often found tattooed literally all over their bodies. The men who are frequently under arrest find, in tattooing, a help to kill time. Whole pictures copied from illustrated newspapers or the covers of match-boxes are often imprinted on the flesh by the use of needles and colouring matter. Mottoes are also engraved, and marks of trades, or religious and patriotic emblems, are very common. Places like Loretto and other centres of pilgrimages are also centres of the art of tattooing. Sacred signs are stamped, for a small charge, on the bodies of the pilgrims, and this practice actually prevails in Jerusalem. In Paris and other great towns there are professional tattooers, and the cost of a really elaborate design may reach twelve or even twenty francs. The lowest class of women in French Africa are also tattooed with a liberality which the New Zealand *tubras* might envy or despise. Mankind is naturally prone to relapse into the barbarous customs of the past, and there can be no better proof of this than the extent to which tattooing is practised in the armies and prisons of France and Italy. Indeed these tattooed civilized men have sunk even below the standard of the barbarian of New Zealand. Civilized tattooing is mechanical in method, and trivial or disgusting in subject, while the "moko" of the New Zealanders is designed on sound principles of decoration.

The recent French and Italian researches prove that tattooing in Europe is chiefly confined to men. Roger Tichborne wished to tattoo his cousin, and Mr. Payn tells, in the *Belgravia* Christmas Number, a very moving tale of a young lady of rank who tattooed her arm with the name "Tom." School-girls should remember that, however devoted they may be to "Tom" at the age of fourteen, at eighteen they will find the indelible token of this affection rather inconvenient. But, if all tattooers were as expert as the Dyaks, ladies who love blue china might consent to be tattooed. The hands of a Dyak woman in Mr. Carl Bock's *Head Hunters in Borneo* have the most beautiful blue ornaments, in the most exquisite taste. We have known æsthetic ladies who tinged their nails with henna; from this to tattooing *à la Dyak* is but a short step. Whether young dandies should tattoo themselves is a question that may be left to the cultivated taste of long-haired lads who already wear bangles and bracelets. The first young man tattooed in Nankin blue will doubtless have a success, but imitation might prove monotonous. It is certain that Europeans will find no better teachers in this art than the china-collecting, head-hunting Dyaks of Borneo.

#### LONDON SMOKE.

THE meeting held at the Albert Hall on Wednesday, by way of prelude to the opening of the Smoke Prevention Exhibition, did not contribute much to the public knowledge of the subject. It was hardly necessary to subpoena the Marquess of Lorne

to prove that roses will not now grow in Kensington as well as they did when he was a child. That vegetation does not, as a rule, like smoke is a fact which might be sufficiently vouched for by a lesser authority than a son-in-law of the reigning Sovereign. It was a little more to the purpose to be told by Mr. Shaw-Lefevre that it costs 2,500*l.* a year to repair the damage done to the Houses of Parliament by the smoke which comes from the 800,000 private chimneys of London. If public money can be saved by a Smoke Consumption Act for London, an economical Government may be the more inclined to legislate in the sense desired by Lord Aberdare. It would have been better, however, to have been told by some of the scientific members of the National Health Society in what direction the Exhibition is likely to prove most useful. Few things can be less profitable than an unintelligent saunter through a crowd of grates of every size and pattern, each warranted by its maker to give out so much per cent. less smoke than any other which has been invented, and most of them proving, when tried, to be very little better than those already in use. Happily the exhibits will in this case supply the materials for a partial disproof of their owners' praises. It is to be presumed that they will be shown in actual operation; and, if so, the smoke, if there be any, must go somewhere. Flues have been provided to meet this contingency; and the visitor's first step, when comparing the merits of two rival grates, will naturally be to go outside the Exhibition and see from which flue most smoke is escaping. Hot controversies will probably arise as to the share which each particular apparatus contributes to the cloud which will be hanging over the several chimneys, unless, indeed—which seems impossible—each should be given a flue to itself. If the meeting of Wednesday had been turned to the best advantage, the visitors to the Exhibition would have been told by some expert what is the extent to which, with our present scientific knowledge, a domestic grate can be made to consume its own smoke, and whether the obstacles to the employment of the grates which seem best to satisfy this requisition have most to do with their cost or with the difficulty of using them. So many of the public, at all events, as visited the Exhibition on Wednesday might then have made a better use of their afternoon. In a collection of this kind it is highly important to have some scientific clue provided for us if the Exhibition is to claim any precedence over the ordinary display in an ironmonger's shop.

Another point which was unaccountably passed over at the opening of the Exhibition was the extent of the harm which is done by the presence of so much smoke in the atmosphere. The Lord Mayor had the courage to say a good word in behalf of factory chimneys. In the Essex marshes, he says, they have destroyed the ague which was formerly abundant there, and he intimated, although with evident caution, that, before abolishing the chimneys, it would be well to try our hand on the ague. Unfortunately for the owners of the chimneys, Sir Henry Thompson was ready with an explanation which was entirely fatal to the salutary value of smoke. The appearance of the chimneys has, it is true, been fatal to the ague; but the explanation is simply that the draught created by the furnace fires carries off the miasma which, when left stagnant, becomes a cause of ague. It would be equally true to say that smoke cooks our dinners or dries our clothes because neither process could be performed without the fires in which the smoke is generated. If London really consumed its own smoke, what would be the state of the atmosphere? Would fogs, for example, be as frequent, though less yellow, and would the invisible gases which we imagine would still be given out into the air be equally injurious with the solid products which are now sent forth from our chimneys? In dealing with a large question like this it is extremely important not to assume more than we can prove. Every one acknowledges that smoke is disagreeable; but is it disagreeable only, or unwholesome as well as disagreeable? Considering the injury that it undoubtedly does to vegetation, it seems natural to suppose that it does equal injury to animal organisms; but, like some other natural suppositions, this can hardly be taken as an established truth. The fear is that it will some day be assumed and acted on, and then the whole movement in favour of smoke prevention may be upset by the discovery that the particular evils attributed to smoke either do not exist or are attributable to some other cause. This would not in the least prove that other evils which it is quite as well worth our while to abate are not the direct result of smoke, but it would probably be taken for a time as tantamount to a break-down of the whole case. Before the Exhibition is over it is to be hoped that the National Health Society will arrange for the delivery of some temperate lectures by eminent doctors, giving a plain and unvarnished account of the diseases which they have been able to trace to smoke in the course of their own practice. So much attention is now paid to health that if it were proved by scientific testimony that London smoke is distinctly unwholesome, there might, in the event of the right sort of grate being adopted, be some chance of getting its adoption in newly-built houses made compulsory. We do not mean, however, that the case against smoke is not to be taken as made out unless it is shown to be directly injurious to health. Life in London is not so purely delightful that we can afford to put up with any needless aggravation of its discomforts. At all events smoke generates dirt, and dirt is certainly a remote cause of disease, even if it be not an immediate cause. If we were compelled by the conditions of life in London to mix ashes with the food we eat, we should scarcely sit down patiently under the infliction. But a glance at the

telegraph wires may serve to suggest that our daily meal, though it may be less gritty, can be scarcely less black. The whole atmosphere is full of sooty particles which we cannot escape swallowing if we would; and if this unpleasant state of things is preventable, it argues great poverty of invention or an ignorant patience of avoidable annoyances if we take no steps to prevent it. As regards the action of smoke upon vegetation, the case is pretty much the same. The money spent in growing flowers in London must come to a very large amount in the course of the year, and if this money is in a great measure wasted because we do not choose to do something effectual in the direction of smoke prevention, it will reflect but little credit on our ingenuity as a practical nation. We do not see why, supposing it should be shown to be possible to make every grate consume its own smoke at a not unreasonable cost, every householder should not be forbidden to send his smoke into the air, just as he is already forbidden to throw the contents of his ash pit into the street. The question is simply one of degree. The community have a right to forbid one act as well as the other—the only point to be considered being the extent of the nuisance which each causes, and the possibility of preventing it.

It is well that Londoners should at last have taken up the question of smoke prevention in this fashion, because it shows that they are not content with preaching reformation to others and allowing their own stable to go uncleansed. No doubt the harm done by the factory chimneys in Lancashire or in the Black Country is much greater than the harm done by the domestic chimneys of London. But it is never expedient to neglect an evil for which we are ourselves responsible in order to concentrate an attack upon an evil with which as Londoners we have nothing to do. If it should prove to be possible to abolish smoke in London, we shall have all the more chance of being listened to when we urge the factory-owners of the North to take in hand the more consecrated, and consequently the more manageable, evil by which they are confronted on every side. It is possible, too, that in the search after machinery which shall enable an ordinary domestic grate to consume its own smoke, some valuable experience may be gained as to the best means of enabling a factory furnace to consume its own smoke. The real test of the degree in which the public has been educated by the recent discussions and by the present Exhibition will be the readiness which is ultimately shown to make the use of some satisfactory form of grate compulsory in private houses. It has hitherto been supposed—or, rather, we have acted as though we supposed—that it is an essential part of a nuisance that it should be created by some process which is carried on for gain. The man who bakes our bread is punished if he allows his chimney to part with its smoke; but the man who equally allows his chimney to part with its smoke without doing us any service in return is treated as beyond the reach of the law. An Englishman's house is his castle so long as he puts his fire to no purpose that is useful to his neighbours. It ceases to be his castle so soon as he does put it to such a purpose. It is of the more importance that this distinction should be broken down because the enormous extension of London makes the area of the mischief so very much wider. We must go a long way afield before we can find a suburb as free from smoke to-day as Kensington and Brompton were thirty years ago. If nothing is done, the canopy of smoke under which Londoners have to live will get yearly wider and denser, and the work of breaking it up will become proportionately more difficult. If the Smoke Prevention Exhibition should result in the discovery of a grate that really prevents smoke, the National Health Society will have made an invaluable contribution to the public comfort.

#### PUBLIC SCHOOL BOOKMAKING.

THE topic of our present remonstrance is not the excessive prevalence of betting at our public schools, nor, indeed, are we aware that rebuke on that head is particularly called for. It is an outside excrescence or parasitical attack, not an inward disease, that we mean to speak of. We could not mark its nature in few words by any less ambiguous title than the one we have prefixed, in which the term bookmaking is to be understood in its first and liberal sense. The public schools of England are cherished institutions, and, like all objects of popular interest, are exposed to the Nemesis of having flippant and hasty books made concerning them by compilers. Just now the compiler is deprived, as it happens, of any decent excuse. For there is a still new book on the Public Schools, noticed by us in the spring of this year, which, though written in a familiar way, is a really sound and useful book. But the compiler is an irrepressible species. Mr. Charles Eyre Pascoe has got together a certain amount of history and legend about the public schools by the ordinary compiler's processes, and, moreover, has bethought him of a novel attraction for British parents and schoolboys. This is the enlisting of the schools themselves in the work. He has induced recent, or in one or two cases present, pupils at the leading schools to write for him accounts of their daily life and manners; and the collection appears under the title of *Everyday Life in our Public Schools, Sketched by Head-Scholars of Eton, Winchester, Westminster, Shrewsbury, Harrow, Rugby, Charterhouse, and so forth*, "edited by Charles Eyre Pascoe." And in the book itself the names of these scholars are given. Now we are strongly of

opinion that, without Mr. Pascoe's latest invention, English school-boys get in sundry ways quite as much premature publicity as is good for them; and we should therefore not be disposed to congratulate Mr. Pascoe, even if his invention were justified to the greatest extent to which literary success could justify it. But peradventure this is not our affair. There is no law to prevent any one from publishing whatsoever he can get printed and published at any time after he is old enough to write. We presume that the consent of the parents or guardians of these young gentlemen has been obtained to the present publication; and, if they do not object, other people are free to regret the example, but they can hardly do more. And we shall say nothing more on this matter; nevertheless, thinking of it as we do, we cannot be extremely sorry that the result, taken on its merits as a literary performance, is not of an encouraging kind. We have, indeed, no grave censure to pass on the contributions of the "head-scholars" (we should like to know, by the way, in what public school, if any, such a term as "head-scholar" is current). They speak well, in the main, for the tone and culture of modern sixth-form boys. They are simply and candidly written, and on the whole with creditable intelligence, though in one or two of them there are slips which look as if the writers had not revised their work with much care. Assuming that the thing was to be done in this fashion, the editor has no reason to complain of his materials. But to make the best of the materials would need a very different editor from Mr. Pascoe.

Mr. Pascoe's part of the work, it appears, is reprinted from the *Leisure Hour*; and we do not know that it is more slipshod than contributions to minor magazines have a license to be by present custom. But that excuse, whatever it be worth, will not serve when slipshod work is republished in cold blood. The key-note is struck at once in the preface by a sentence of fatuous complacency. "There are few parents, indeed," says Mr. Pascoe, "who would not desire to educate their sons at a Public School; and there are few lads of any spirit who would not hail with satisfaction the prospect of entering one." As to the lads of spirit, it may safely be assumed that the boys of well-to-do parents will always hail with satisfaction the prospect of doing what they are brought up to believe is the proper thing for people of their class to do. But as to the parents, an author who undertakes to instruct us about the public schools should not be unaware that among the parents and schoolmasters who think seriously of these things it is understood that our whole public school system is on its trial as it never was before. Not that the schools are worse; on the contrary, they have been made much better in every way than they were even one generation ago. But people have begun to reflect, and to consider that education is a thing to be taken in earnest, and means a good deal more than learning lessons and playing games. Among the most notable signs of the times in this respect is the admirable address delivered by Mr. Wilson, formerly of Rugby and now Head-Master of Olifton, to the Education Society, and printed in the *Journal of Education*. Parents will do much better to read that, and read it carefully, than to amuse themselves with the odds and ends of school "shop" collected by Mr. Pascoe. We need hardly apologize for a little digression which has led us to mention one thing of solid value in the course of this article. The value of Mr. Pascoe's historical, legendary, and archaeological smatterings is merely naught. He gives an account of the constitution of one public school after another, but seems never to understand their relations and differences. In his chapter on Shrewsbury there is the following curiously bungling passage:—

It has been somewhere remarked, and not without some ground for the assertion, that the Foundation boys of each of our great schools represent the school; in other words, that the "Collegers" of Eton represent Eton College as founded by Henry the Sixth; the "Scholars" of Winchester, Winchester College as founded by William of Wykeham; the "Queen's Scholars" of Westminster, St. Peter's College as established by Elizabeth. In the case of Shrewsbury School, this order of things has been reversed, owing to the restriction imposed by Edward, of reserving the principal benefits of his Free Grammar School to the sons of the burgesses. Since his day, the burgesses, or those inhabitants of the town of Shrewsbury who possess the legal qualification to be so named, have greatly declined in number, and each succeeding year they have become fewer and fewer. Only a few persons now live within the old borough liberties of Shrewsbury; the town proper is mainly used for business purposes, the inhabitants residing on the outskirts. Hence it has been brought to pass, that the number of scholars having the statutable right to be educated at the school under Edward's charter at the lower fee have become so greatly reduced that, if the school had depended for its existence on the influx of "Oppidani," or Town-boys, it must long since have been closed. The prestige of Shrewsbury School has been mainly upheld, and its fame promoted, by the "Alieni," who have sought admission to it from all parts of the kingdom.

Mr. Pascoe is comparing incongruous things. The truth is that our public schools fall into several distinct classes. We have the endowed Colleges of Royal foundation—Winchester, Eton, and Westminster—with their fixed body of foundation scholars enjoying the founder's gifts, and a more or less variable body of outsiders who pay their own way, and whom the authorities are in strictness not bound to take in at all. The type is just the same as that of a College at either University, with its head, fellows, and scholars who are members of the foundation, and pensioners or commoners who are not. The head of the Oxford or Cambridge House corresponds, of course, to the Provost of Eton or Warden of Winchester, not to the Head-Master. Eton College would have been formally complete in itself without any oppidani, just as the associated foundation of King's at Cambridge ("affiliated,"

as Mr. Pascoe ludicrously calls it) not only might be, but until our own time was, complete in itself without any pensioners. But even the actual association of King's with Eton, and of New College with Winchester, has failed to exhibit this obvious homology to Mr. Pascoe. Then we have the Grammar-schools of the Reformation period, in one or two cases of Royal foundation, but mostly the work of private munificence, which were designed in the first instance exclusively or chiefly for the benefit of residents. There are schools of this type all over the country. Some of them, being favoured by circumstances, have gained a national reputation, and taken rank as public schools in the most eminent and honourable sense. Harrow, Rugby, and Shrewsbury, are of this class. The thing to remember about them is that they do not formally differ from many other schools which have not had the like success. There was no reason in the nature of things why the Grammar-schools of Sherborne or Tunbridge, for example, should not have become what Harrow and Rugby became. And there is no reason in the nature of things why old Grammar-schools which have hitherto remained obscure should not yet make for themselves a considerable place if they fall under capable direction, as indeed the two we have last named are doing. St. Paul's and Merchant Taylors stand apart from other grammar-schools as the work of men who were advanced reformers in their day. They reject the principle of local advantage, and have been free and open from the first. St. Paul's is now on the point of entering on a new course as a day-school on a large scale, with the advantages of public-school traditions, and teaching of the best public-school standard. The experiment will be most interesting, and if it succeeds may have great consequences. Lastly, we have two peculiar foundations, also of the Reformation period, where charity in the popular sense was a material or principal part of the original scheme. These are Charterhouse (by its proper legal name Sutton's Hospital) and Christ's Hospital. Perhaps, however, the difference between these and the older collegiate foundations should be reckoned only one of degree; for in most of these, if not all, distinct provision for the poor was included. These charitable provisions have either been commuted, or have become so insignificant beside the scholastic part of the foundations that few people remember their existence. On all these matters Mr. Pascoe is either silent or hopelessly confused. So that his account of the public schools, as English institutions of a very typical and remarkable kind, is perfectly worthless.

Neither is Mr. Pascoe happier in details. We begin with his account of Eton, which comes first. He tells us that "the secular priests who under the charter"—he means statutes—"were retained for the daily service of the chapel have long since been relegated to the things of the past." It is true that secular priests, as a class distinct from regular, are "relegated to the things of the past," every Anglican priest since the Reformation being secular; but the particular secular priests in question are to this day represented at Eton by the Conducts (*conducti*, or *salaried*), of whom Mr. Pascoe has evidently never heard. The modern reforms in College are post-dated by about a generation. "Fagging in the days gone by (we write of twenty-five years ago) was fagging, indeed," says Mr. Pascoe. "No proper surveillance was exercised by the masters; and a junior collegier's life was wellnigh one of positive misery." We say of our own knowledge that between twenty and twenty-five years ago this was not the case. Fagging has been in some respects diminished since; but even then it was milder at Eton, and in College in particular, than we still understand it to be at some other schools. And the other reforms in College mentioned by Mr. Pascoe as if they were quite recent are about forty years old. A similar mistake, though on a much smaller point, occurs in the chapter on "Life in College" contributed by a recent Collegier. The late Oppidan's story of "Life among the Oppidans" which follows has a certain pleasing simplicity. It begins with stating that "the generally received idea that an Eton Oppidan has not so much work to do in school as a Collegier is an erroneous one." Quite true—but with the qualification that, brilliant exceptions excepted, the Collegier does his work and the Oppidan does not. The same contributor mentions that the Head-Master "thought it his duty" to take notice of an extremely gross and, we should ourselves add, all but unprecedented case of bullying. He further endeavours to instruct the British public in the mystery of the "wall game" of football; about as hopeful a task as for a conveyancer to explain to a layman the operation of a common recovery, which a Chief Justice of the last century declared to be in its nature inscrutable. We pass on to Winchester. Let us hear Mr. Pascoe's interpretation of the threefold inscription in the schoolroom, "Aut discere, aut discere, manet sors tertia cædi." Apparently he has not discovered that it is a hexameter verse; but that is nothing. "In other words," he expounds, "the scholars are warned, either learn—Or depart hence—Or remain and be chastised." Any Winchester boy who in our fathers' days had been so misguided as to offer "remain and be chastised" as a "construe" of "manet sors tertia cædi" would have speedily made a better acquaintance not only with the grammar of the sentence, but with the practical meaning of the *sors tertia*. Discipline is gentler now, and perhaps he might escape with moderate admonition and not moderate derision. After this it is but natural that Mr. Pascoe should talk of "rules for the conduct of the students, written in Latin, in the style of the famous Duodecim Tabulæ of the Romans." The discreet reader may judge whether Mr. Pascoe has ever read a word of the fragments of the XII. Tables, or

would understand them if he did. For the early history of Westminster Mr. Pascoe quotes, at second-hand as we suspect, and with all but implicit faith as appears by his language, the chronicle of the false Ingulf. In the same chapter is an extremely absurd comparison of the general characters of the different schools. Mr. Pascoe is much awed by the aristocratic air of Eton collars, and imagines Rugby to have a monopoly of "the bone and sinew of England." We might pick out more blunders and crudities; but we are already ashamed to have troubled our readers with criticism of such flimsy stuff as this "introductory historical matter." The only part of the book that may some day be worth something is the glossary of school terms at the end. It is nothing like complete, and contains at least one serious mistake—the definition of "sock" at Eton as "edibles of various kinds privately imported into college, house, or school." "Sock" means and includes all petty refreshments—fruit, ices, or what not—consumed outside set meals, whether privately or openly. The word implies a certain superfluity. Bread and cheese taken to satisfy hunger on a long walk would not be "sock." But it does not imply anything clandestine. It also is, or was, used as a verb, to give by way of "sock," and thence to give generally; but this, we think, was rather a lower-boy usage. However, this glossary is the only attempt we have seen to collect the terms of art of the different schools, and some philologist may one day find it useful for want of a better.

#### THE MONEY MARKET.

THE course of the money market this autumn has not been in accordance with the expectations of the most competent observers. For a period, much longer than had been anticipated, the interest charged for the use of capital in the short-loan market continued low, although gold was taken in immense amounts for the United States. In the middle of August, however, the Bank of England raised its rate of discount from 2½ per cent. to 3, and a week later to 4 per cent. In the beginning of October it further raised the rate to 5 per cent., and has maintained it since at that figure. But no sooner had the rate been advanced to 5 per cent. than rates in the "outer market," as it is called, began to fall away; in other words, the competition amongst themselves of the banks and discount-houses which cluster round the Bank of England was so great that the rates charged by them fell to 1½, and at one moment even to 1¼, per cent. below the official minimum of the Bank of England. This showed that the demand for loanable capital here at home was but slight. Although trade has been improving for the past two years, and continues to improve, the improvement has not yet reached that stage which occasions demand for a great amount of accommodation on the part of merchants and manufacturers. There is no marked rise in wages or prices, and, until that occurs, the absorption of capital by trade will not be largely augmented. The real cause of the rise in the rate of discount was the drain of gold, particularly for the United States, and to a lesser extent for other foreign countries. As soon as that drain began to fall off the outer market took courage, and, as we have said, rates then fell away steadily; but about a fortnight ago there was a sudden change, and rates began to rise again, until at the close of last week they reached 4½ per cent., an advance of fully 1 per cent. in about ten days. To understand this sudden movement it must be borne in mind that the Bank of England is much more poorly provided than it was a year ago. Roughly speaking, it holds now six millions of gold less than it did at this time last year, and its reserve also is fully five millions smaller. The market, therefore, is very much less able to bear any strain upon it than it was last year, and still less able than it was two years ago. A slight cause consequently produces a considerable effect, and the special causes which have now been acting are three in number.

It is usual in the month of November for a considerable amount of gold to be taken from the Bank of England by the Scotch banks. In the middle of November the circulation of the Scotch banks rises considerably, and to cover this increased circulation the banks have to provide themselves with gold. The gold thus withdrawn from the Bank of England of course lessens its reserve, and leaves the London market poorer than before. The movement, however, is now well understood, and, as it is temporary in its nature, it is of itself calculated to have but a slight influence upon the market. Still it leaves the market poorer and less able to bear any strain which may arise. One such strain was caused by the preparations of the India Council for paying off a portion of its debt. The India Council is usually a large lender of money in the short-loan market of London. The fact is singular, since it would be considered contrary to sound principle if the Chancellor of the Exchequer were to enter the money market to compete with bankers there. But it is to be borne in mind that the India Council is the successor of the old East India Company; that the East India Company, like other trading associations, was in the habit of lending whatever surplus cash it happened to hold for the time being, as any other traders might do; and that the India Council has inherited this among other practices. The market quietly accepts a custom which, if introduced for the first time, it would certainly cry out against; and thus it happens that the India Council is usually a large lender in London. But a year ago it gave notice that it would pay

off on the last day of the month just ended certain bonds which it was entitled to pay off on giving a year's notice. As the time for payment approached, the Council was of course obliged to cease lending, and also to begin to call in the loans which it had made for short periods. The amount to be paid off was between four and five millions; and this large sum, withheld from the market at a time when the market was, as we have just been explaining, poorly supplied, caused a considerable rise in the value of money. The borrowers from the India Council had to provide themselves with the means to pay off the Council, and the demand created by them at once sent up rates. In addition to these causes there was the resumed export of gold to various places—South America, Portugal, the Cape, and India—and, above all, to America.

The export of gold to the United States this autumn has been very much smaller than last year or the year before; partly because the exports of those two years had almost provided the country with as much currency as it needed, and partly because the bad wheat harvest in America this year diminished the debt due by Europe to the United States, and consequently lessened the power of the United States to draw upon Europe for gold. It was, as we have already said, the drain of gold to the United States which in the early autumn caused the advance in the Bank of England rate; but the drain did not assume large proportions, and soon ceased, and people had begun to believe that no more gold would be taken, when suddenly pressure arose once more in New York. This pressure was caused partly by a succession of bank failures in Newark, New Jersey, and in Boston. The shock to credit given by these failures originated rumours in New York itself that one of the principal banks there was in an insolvent condition, and a scare followed. The bank, however, immediately invited the Clearing House Committee to examine its accounts, and the Committee reported that the bank was in a most satisfactory condition. The scare abated, but still there has remained a feeling of uneasiness, and all who are under engagements to pay large sums have been taking precautions against what might happen. In addition to this the market has been disturbed by the action of the United States Treasury. Here in England the proceeds of taxation are paid into the Bank of England to the account of the Government, and are thus available for trading purposes until the Government needs them. But in the United States the proceeds of taxation are paid directly into the Treasury, and are kept locked up there until they are needed. In the remote districts, indeed, the Government uses some of the banks as agents for collecting or depositing its receipts; but, speaking generally, the revenue is not deposited in banks, but is locked up in the Treasury until it is needed. As our readers are aware, the United States Government collects a revenue much larger than is required to defray its current expenses. The surplus income this year is estimated to amount to about 24 millions sterling, and during the present autumn the receipts have been coming in in exceptionally large amounts. Thus the Treasury has been taking out of the market very large sums at the very time when the market was apprehensive, and therefore needed a full supply. To remedy this state of things the Secretary of the Treasury advertised that he would buy every Wednesday during November bonds to the nominal amount of 400,000*l.*, and, in addition, he had called in for redemption a considerable amount of bonds which are to be paid off on Christmas Eve. But, as he offered for the bonds to be bought weekly only their par value, with the interest accrued at the time of payment, he has been unable to make any purchases during the month. A large class of lenders—as, for example, trustees and savings banks—are allowed to lend upon Government securities, but not upon any other kind of Stock Exchange securities, and consequently there is always an active demand for Government securities for the purpose of obtaining loans upon them. And as the United States Government has of late been reducing debt at an unprecedentedly rapid rate, this demand has run up the price of the Three and a Half per Cent. bonds, which alone the Secretary of the Treasury is willing to buy, above the figure which the Secretary offers for them. It thus happens that, while the Treasury by its collection of the taxes is abstracting from the market very large amounts, it is unable to return to the market by means of the redemption of debt such sums as would relieve the pressure. For these reasons the New York market has been exceedingly stringent for some weeks, and the exchange upon London fell to a point which threatened a renewal of the drain of gold; indeed last week an amount of gold was withdrawn from the Bank of England for despatch to New York. This withdrawal accentuated greatly the rise in the value of money here, as it was feared that it might be, but the beginning of another drain which might make money extremely dear. This has not, however, proved to be the case. The exchanges have again risen, and it appears improbable now that gold to any considerable amount will be taken. Moreover, there is a general opinion that the new Secretary of the Treasury will adopt energetic measures to prevent the action of his department from causing a crisis in the money market. He is not a financier, and he requires some time to consider what measures he should take. Indeed his only knowledge of finance was acquired when, for a single year, he held the office of Sub-Treasurer of the United States in New York about twelve years ago. Since then he has been Chief Justice of the Court of Appeals of New York, in which capacity he is not likely to have had either time or opportunity to pay much attention to finance. It is not surprising, therefore, that he has taken time to consider

his policy; but it is believed that he has now decided upon adopting such measures as will relieve the market.

As regards the immediate future it seems probable, as we have just said, that no drain of any considerable amount to New York is now to be feared; but it is also evident that the action of the India Council in paying off its bonds has ceased, while the drain of gold to Scotland is also over; indeed the gold is now coming back. Moreover, what we may call the miscellaneous export of gold to India, the Cape, Lisbon, Vienna, Monte Video, and Buenos Ayres is not important, and is not likely to exercise much influence upon the market. On the other hand, however, the demand of Italy for gold, in order to resume specie payments, is still unsatisfied; and the contractors for the Italian loan will continue their operations, taking gold, if not from this market, yet from quarters which would have supplied this market if not thus intercepted. Moreover, the improvement in trade continues; and, when it reaches a certain point, it will lead to a demand for additional capital on the part of manufacturers and merchants, and will thus tend to enhance the value of money. But, for the present, the general expectation is that rates will tend to fall, though they may begin to rise again as Christmas approaches.

#### THE THEATRES.

THE revival at the Haymarket by Mr. and Mrs. Bancroft of *Plot and Passion* was in some ways a curious experiment, of which the results were naturally watched for with interest. The Haymarket company has hitherto been occupied with stuff less strong than that of *Plot and Passion*—a play which demands strong and strongly-marked acting. The piece is described in the bills as the work of the late Mr. Tom Taylor; but there seems some reason to believe that part of the credit of its authorship was to be attributed to Mr. John Lang. It is not known to be founded upon any French play, and yet there is seeming evidence of some French origin, which cannot but strike a reader of the play, in the turn of the phrases. However this may be, the piece is a striking and effective piece of stage craft, and has the great merit that the interest in its action never slackens. The plot is mainly concerned with the downfall of Fouché, who in the first act appears disguised as an Abbé in the house of a certain Mme. de Fontanges, who is for the public a "grande dame de par le monde," but who is secretly an agent of Fouché's. Another creature of Fouché's, Desmarets, is secretly plotting against him, and has given private information to an anonymous pamphleteer, Henri de Neuville, a native of Guadeloupe, whom Fouché accidentally discovers. Desmarets by a stratagem procures the pamphleteer's escape, and then persuades Fouché to send Mme. de Fontanges after him to decoy him back to Paris, thus taking his revenge upon Mme. Fontanges for having scornfully rejected his own protestations of love. Mme. de Fontanges consents to do this under the pressure of Fouché's threat to denounce her as a paid spy, and follows Henri de Neuville to Prague. Here he falls desperately in love with her, and she falls as desperately in love with him; and from the moment when this is known the interest of the play centres in the plots and counterplots made by Mme. de Fontanges, Desmarets, and Fouché. These parts, originally played by Mrs. Stirling, Robson, and Emery, are now undertaken by Miss Ada Cavendish, Mr. Arthur Cecil, and Mr. Bancroft; while that of the fiery and chivalrous Henri de Neuville, formerly undertaken by Alfred Wigau, is now played by Mr. Conway. Both in the action and in the dialogue the colour has been laid on with a good fat brush, and the play seems throughout to demand a strength and breadth of interpretation which is perhaps not always reached by those concerned in its rendering. Mr. Bancroft's polished style suits well enough the mock character of the Abbé which Fouché supports; but he lets us see too little of the real Fouché, the unscrupulous and ambitious Minister of Police, whose agents are everywhere, while they are all, at least in appearance, abjectly obedient to him. Mr. Arthur Cecil had an unusually difficult task in undertaking a character associated with the memory and reputation of Robson, an actor whose peculiar gift of intensity lingers in the memory of many playgoers and is known by tradition to many others. Certain former performances of Mr. Cecil's have made us believe that he had it in him to play parts demanding this special intensity; and we still think, having seen his performance of Desmarets, that he has it in him. But, on the occasion on which we saw him play the part, he did not succeed in giving his conception of the character an adequate outward expression. His facial expression was from beginning to end fine and striking, and in this one could trace that he followed the character's varying phases with appreciation; but his voice and gesture did not correspond to his wish. He seemed, in fact, to have, to borrow a French phrase, emotions which did not cross the float. This has happened to many actors of exceptional merit on former occasions, and probably will happen again and again. Mr. Cecil's present performance of Desmarets, if it is for the moment disappointing, affords no reason for concluding that parts of a calibre similar to that of Desmarets will in the future be out of his reach. In Henri de Neuville Mr. Conway displayed a fire and passion for which we were not wholly prepared. Mr. Conway has always acted with grace and intelligence; but we have not before seen him go nearly so far as he now does in the direction of seemingly spontaneous emotion.

In the love scenes he displayed an unforced tenderness and fire, and in the scenes of anger he showed at once strength and self-restraint. Mr. Pinero as Cevennes gives an excellent and unexaggerated study of a fop of the time. We have kept for the last the great praise which we have to give to the rendering of Mme. de Fontanges by Miss Ada Cavendish, who, always an actress of high skill, seems to us to have gained much in the power to interpret varying emotions. Her last scene—an especially difficult one—was especially well played.

*Plot and Passion* is followed by Mr. Burnand's bright and clever adaptation of *Lolotte*, in which Mrs. Bancroft plays the part taken in the original by Mme. Ochaumont; a part which in *A Lesson* is that of Kate Reeve, a popular actress, who comes to give instruction in two of her favourite characters to Lady Duncan, wife of a Scotch banker, who detests theatricals, but who has been over-persuaded to allow his wife to act for a charitable institution. A good deal of fun is got out of Lady Duncan's astonishment at finding that the actress is off the stage a well-bred lady without a tinge of Bohemianism, and more is got out of the *verve*, tempered by Mrs. Bancroft's well-known skill, with which Kate Reeve throws herself into the task of showing Lady Duncan how to deliver burlesque lines riddled with puns, how to sing the kind of songs now popular in burlesques, and how to dance a burlesque dance. A serious interest is given to the little piece by Kate Reeve's discovery that her husband, whose marriage with her has been kept secret, is making love to Lady Duncan. The husband comes suddenly in while Kate Reeve is waiting for her cue behind a screen, and begins immediately to urge his suit. The actress stops forward and delivers herself of a scathing speech of rebuke, which is given with much force and dignity by Mrs. Bancroft. As she draws to an end she finds herself face to face with Sir Thomas Duncan, who has come in unobserved by her, and breaks off with "That, Lady Duncan, is how I should like you to speak the speech." The little play is well written; but its success naturally depends upon the admirable manner in which it is acted by Mrs. Bancroft, Miss Henri, Mr. Conway, and Mr. Brookfield, whose performance of Sir Thomas Duncan cannot but add to his reputation. His Scotch is capital; and his byplay is just what byplay should be, sufficiently marked, but never obtrusive. He is specially to be commended for the studious moderation of his acting at his last entrance, where any provocation to a laugh from the audience might spoil the situation. The scene is set with much gorgeousness; and the peculiarly hideous effect of a cast of the *Milo Venus*, with a bronze body and silver drapery, may be intended to indicate the deficiencies of Sir Thomas Duncan's taste.

At the Court Theatre Mr. Clayton has reproduced *Awaking*, Mr. Campbell Clarke's well-written adaptation of *Marcel*, and Mr. W. S. Gilbert's *Engaged*, in which Mr. H. J. Byron is specially engaged for the part of Cheviot Hill, formerly played by Mr. George Honey. *Awaking*, it will be remembered, is a one-act play, in which Mr. Clayton appears as a father who has lost his reason in consequence of the accidental slaying of his own son, and who is restored to health by an ingenious and touching plot. The interest of the piece is of an entirely pathetic kind, and the pathos is of the strongest order. It makes an incessant demand, while it lasts, upon the powers of the actor who appears in the principal part, and this demand is as fully met as possible by Mr. Clayton, who seems to us to have made a great stride in his art since he first appeared in the character of Tremaine. Look, voice, and gesture are throughout so carefully studied and controlled that the effect of the acting is completely spontaneous; and the final moment is, without a hint of maudlin sentiment, one of the most touching things to be seen on the stage. We wrote at length of *Engaged* when it was first brought out at the Haymarket, and it need now only be said that it is in many ways more effectively played than it was then, since all the performers have seized the idea that it is necessary to play its most ludicrous passages with the most complete seriousness in order to give them the desired effect. Miss Marion Terry, Miss Thorne, and Mr. Bellew play even better than before in their original characters, and Mr. Byron has certainly a truer notion of how Cheviot Hill should be played than Mr. Honey had. His performance on the first night was not so complete as it probably will be in future; but we have always agreed with Mr. Byron himself that a first night's performance is not a true test, under present conditions, of the merits of a play or an actor.

## REVIEWS.

### BISHOP THIRLWALL'S LETTERS.\*

THESE two volumes of unequal interest, though they are published together, are only so far connected that they contain correspondence by the same person. Of three nominal editors, only one seems to have performed the task which his name

\* *Letters, Literary and Theological, of Connop Thirlwall, late Lord Bishop of St. David's*. Edited by the Very Rev. W. Stewart Perowne, D.D., and the Rev. Louis Stokes, B.A. With Annotations and Preliminary Remarks by the Rev. Louis Stokes. London: Richard Bentley & Son.

*Letters to a Friend by Connop Thirlwall, late Lord Bishop of St. David's*. Edited by the Very Rev. Arthur Penrhyn Stanley, D.D., Dean of Westminster. London: Richard Bentley & Son. 1881.

implies. Dean Stanley prefixed to the *Letters to a Friend* his funeral sermon on Bishop Thirlwall. Dean Perowne contributes a preface of ten or twelve pages to the *Letters, Theological and Literary*, and he oddly adds a funeral sermon, not on Bishop Thirlwall, but on Dean Stanley. The Memoir, or thread connecting the letters, is furnished by Mr. Stokes, who does not state whether he was personally acquainted with the Bishop. It seems that the Memoir is compiled from an article in the *Edinburgh Review*, written by Professor Plumptre, now Dean of Wells, and Mr. Stokes acknowledges his obligations to the present Master of Trinity and to other informants. Some of the letters ought, if it was thought worth while to preserve them, to have been included in a collection of Bishop Thirlwall's "Remains" which has been already published. A disquisition on a point of theology or of biblical criticism is not converted for biographical purposes into a letter by the accident of being transmitted in a stamped envelope. An exception might have been made in the case of letters of mixed character, such as one which begins with remarks on Hebrew syntax, and ends with a protest against the childish credulity which the writer attributes to an eminent author:—"He was in this respect a born Papiat, and finds his natural element in the *Golden Legend*. . . . Surely it is one thing to believe that all is regulated by a Supreme Will, and quite another thing to believe that this Will employs a machinery like that of the *Rape of the Lock*." Mr. Stokes would also have done well to omit a series of juvenile letters to a schoolfellow, composed in the pedantic and voluminous form which might be expected from a precocious boy; but a biographer with scanty materials at his disposal cannot afford to be too critical in his selections. In the words of the preface, "Even the letters which have been collected do not cover the whole of his life." It is greatly to be regretted that "his correspondence with Lord Houghton, one of his oldest friends, perished, with other treasures, in the disastrous fire at Fyston some years ago." There was probably not one of his friends to whom he wrote with fuller sympathy or with a more thorough certainty of being understood. Bishop Thirlwall is truly described in a passage quoted by the Dean of Peterborough as having been, "not only foremost in the intellectual rank of the clergy: he was, by almost universal consent, foremost in the intelligence of Great Britain." The Dean proceeds to say that, "if he abstained from taking that part in public life which his uncommon powers justly entitled him to take, this was a side of his character which concealed its strength. But it concealed also its gentler and tenderer side. . . . Men thought him stern and severe, because they did not penetrate beneath his mask of reserve. He was, in truth, the warmest and most sympathizing of friends." A pleasant sketch of his ordinary life at Abergwili, by "one who knew him intimately," is added; but it is strange that a friend and admirer should have recorded, without a sense of the rudeness of the comment, his answer to a person who had, at his request, repeated a trivial remark, "Strange how little one loses by being deaf." Genuine kindness and attachment to friends are not incompatible with want of tact and disregard of the feelings of indifferent persons. Bishop Thirlwall was singularly deficient in the faculty of understanding commonplace people, who form the overwhelming majority of mankind. The Dean of Peterborough is perhaps singular in his belief that "no man governed a diocese better." Thirlwall would probably have been an admirable Primate, for he was by nature an ecclesiastical statesman, capable of forming a sound judgment on great public questions, and of exercising influence or authority over those who were similarly engaged. His diocesan charges were admitted, even by those who differed from his conclusions, to be among the most masterly controversial writings of the time; but he had no liking for minute details, and no capacity for dealing with ordinary persons. Probably no contemporary bishop was so deficient in personal consideration for his clergy. When he met them on public occasions he accorded only to a few the barest personal recognition; and in private society he addressed his conversation by preference to any layman who had the advantage of being a scholar or a man of the world. His negligence was not the loss to be regretted because the Welsh clergy are generally of humbler station than those of an English diocese. To serious business the Bishop was always ready to attend; and his pecuniary liberality was great. In his later years his unpopularity with his clergy diminished, as they gradually learned to understand his character and to be proud of his ability and reputation. The Dean of Peterborough is surprised "that a speaker of such acknowledged eloquence should have taken so little part in the debates in the House of Lords. When he did speak he commanded the ear of the House." It is true that Thirlwall's celebrated speech on the Disestablishment of the Irish Church was perhaps the most powerful argument which was addressed to either House. The peers probably listened respectfully to anything which might proceed from the ablest prelate on the Bench; but their attention was granted under difficulties. Some of them were in the habit of describing Bishop Thirlwall as the most tedious of speakers; and out of the House his slowness and prolixity were to ordinary hearers intolerable. In one of the *Letters to a Friend* he reports, with perfect good humour, how the company at a Welsh dinner on St. David's Day interrupted him with the cry of "Time." When he presided at an anniversary of the Literary Fund, his neighbours on the right hand and the left, one an eminent prelate, the other an eminent peer, and both his personal friends, slept calmly beside him for the last half hour of an interminable discourse. Every sentence in his speeches was grammatical; every passage had a definite intrin-

tion; but in his arguments and his digressions he followed trains of thought only cognizable by himself, without an attempt to inquire whether he was followed by his hearers. If Mill's description of Thirlwall's speech at a debating club was accurate, his eloquence must have afterwards deteriorated; but it is not improbable that the merit of the speech consisted rather in its substance than its manner. With an audience exclusively composed of philosophers Thirlwall would perhaps have been an effective orator.

The *Letters to a Friend*, nominally edited by Dean Stanley, are addressed to a young lady with whose family Bishop Thirlwall was united by intimate friendship. His correspondent says that the letters were intended for her father and sister as well as for herself; but they have not the less the charm of the personal sentiment which belongs to one of the most graceful and natural of relations:—

They talked with open heart and tongue,  
Affectionate and true,  
A pair of friends; though she was young  
And Thirlwall seventy-two.

A great scholar, who combined a massive intellect with a kindly and simple nature, probably expressed his grave and playful thoughts most easily to an appreciative pupil; and no man, old or young, can speak with full confidence of sympathy, and therefore with perfect freedom, except to a woman. Although none of the letters on the other side are published, it is evident that the Bishop was fortunate in finding a correspondent of varied attainments and open to wide and general interests. He is consequently able to write with equal facility about his cats, his geese, and his flowers, and on the Irish Church, on the character of Napoleon, or on the study of metaphysics. His remarks on the Irish Church are especially interesting, as they show his extreme dislike to the Disestablishment Bill, for which nevertheless he thought it his duty to speak and to vote. Though almost always instructive, his letters are never didactic, as they always have a personal impulse and application. His notices of the lighter books which he is reading have sometimes a critical value, but they are principally curious as illustrating his omnivorous appetite for reading. It was apparently his habit to allot only one hour in the day to English books; but into that space he contrived to crowd almost every novel which was published, in addition to biography, and other current literature. With Dickens, Thackeray, Bulwer, George Eliot, Mrs. Gaskell, and other principal novelists he was as familiar as Macaulay with the novels of the last century; and it is remarkable that he seems to like everything which he reads. He tells his correspondent that he had intended to read something else, but "Lord Houghton tells me that *Kitty* is the best novel that ever was written, and how can I help reading *Kitty*?" Of *Middlemarch* he never reads more than one chapter at a time, "as one only just moistens his lips with an exquisite liqueur to keep the taste as long as possible." He is not sure whether Sir George Lewis was incapable of enjoying light reading. "If so, I admire rather than envy him." He proceeds to say that he is delighting himself with the thought of reading the *Earthly Paradise* under a tree. The word "admiro" is used in the Latin rather than in the English sense, as expressing wonder. It was true that Sir George Lewis had little taste for light reading, or, indeed, for any kind of reading for the sake of literary gratification, inasmuch as books were to him only valuable as vehicles of knowledge. He was perhaps even a profounder historical critic than Thirlwall, though not a greater scholar; but the student who, like Thirlwall and Macaulay, finds enjoyment in literature itself as well as in the lessons which it conveys, has in that respect a larger intellectual range. In one of his letters Thirlwall accounts for the number of novels which he gets through by quoting the celebrated Equity lawyer, Jockey Bell, who accomplished similar feats with deeds by "always going straight to the charging part." It has been remarked that as a collector of plate or china manages to pursue his vocation in spite of narrow means, a busy man always finds time for reading which he likes. Within the limits of literature, for he knew nothing of science, Thirlwall's range of study was almost boundless. Having begun Latin at three and Greek at four, he soon afterwards learned French, and as a young man he was not a profound classical scholar, but an accomplished linguist. In middle life, on his appointment to St. David's, he became proficient in Welsh, and when he was far advanced in life he amused himself by learning Dutch. He had an extensive or exhaustive knowledge of German philology and criticism, and it appears that he had also studied German philosophy. It is a little surprising to find that he "always considered the problems of metaphysics as at once the highest and the most practical of all to which the human mind can apply itself." In a letter to Dr. Whewell he speaks with extraordinary bitterness of a writer whom many Germans regard as their greatest philosopher: "I have so much faith in the force of truth as to believe that sooner or later Hegel's name will only be redeemed from universal contempt by the recollection of the immense mischief he has done." It is not known that Thirlwall at any time wrote on metaphysical subjects.

The *Letters to a Friend*, even if they had been written by an obscure person, would possess great intrinsic interest. They are extraordinarily valuable as revelations of the true character of the greatest English scholar of his time. Bookish men have almost always certain qualities and defects in common. The love of learning, and especially of those branches of knowledge which may be

called useless, tends to preserve a certain delicacy and simplicity of character, while it apparently interferes with readiness of social intercourse, and with intuitive knowledge of human nature. It was not with impunity that Mill and Thirlwall learned Latin and Greek when they ought to have been playing in the nursery. Eyes, too early fixed on books, see little of the world around. It was in consequence of an unwholesome education which encouraged a natural propensity instead of correcting it, that Mill in mature life mistook the reproduction of his own sayings by his wife for original inspiration. If Thirlwall had not similarly lost touch of humanity, he would have known that courteous small talk would have gone further with Welsh incumbents than all the ripe wisdom of his charges. He was in this respect amenable to just criticism, and he was partly responsible for a mistaken impression of his character. His delightful letters to his young friend will do much to remove a natural misconception. The two volumes which are now published together, each with an excellent index, would have been much less valuable if they had related mainly to Thirlwall's professional or official character. He discharged his various diocesan functions with unequal success, though always with a sincere intention of doing his duty. It was a not wholly felicitous accident that he was a bishop; but he never allowed his perhaps uncongenial position to bias his judgment, or to impair the robust simplicity of his nature.

#### LAND OF THE MIDNIGHT SUN.\*

THERE are some writers who apparently become more hardened sinners by friendly criticism and advice. The present work is marked by the same want of method and arrangement as the *Explorations in Equatorial Africa*. There is no attempt at sequence, coherence, or consistency in the account of these wanderings, which embrace the shores of the Baltic and the Island of Hitteren, the southern town of Malmo at one end and Hammerfest and the North Cape at the other. Between 1871 and 1878 Mr. Du Chaillu spent a term of nearly five years in Norway and Sweden, interrupted, so far as we can make out, by return trips to America. We can readily believe him when he says that he has read much and consulted the best authorities on Swedish archaeology; that he has travelled by steamer, boat, *carriole*, and sledge, many thousand miles; that he has learned to speak more than one native language, including a little Finnish; and that he has seen as much of the family and domestic life of Scandinavians as it is possible for an alien to see. Yet, with all warnings and experience, these two volumes are neither consistent records of journeys nor coherent chapters about the Government, the scenery, and the manners of the people. Overwhelmed apparently by the copiousness of his own notes and the redundancy of literary material, the author has forgotten the duty of sifting, condensing, and reducing to proper shape. There is a sort of beginning in the journey from New York to Goteborg and Stockholm, and there is a not inappropriate termination somewhere near the Sound of the Cattgat. But, with the exception of the fact that we find something of a division between summer tours and sledging in winter, it is extremely difficult to follow Mr. Du Chaillu in his erratic course. He has added a map, which would be of some assistance if the author's route were not marked in a red line of nearly the same breadth and colour as those indicative of high roads and railways; and there are some capital illustrations of Norwegian houses, churches and castles, mountains and glaciers, cascades and fjords. But the reader is transported from the age of the Vikings to the peculiarities of modern farmers, and from the perils of a journey performed on sledges to a fair at midsummer, in a fashion which is rather trying to the patience. A good deal of the ground has been gone over by others; but we can do the author the justice to say that his style is pleasant, his observations intelligent, and all his pages readable even when they tell us nothing new.

An exploration of the Fjords, Fjelds, and forests of Norway and Sweden is utterly wanting in those dangerous incidents which nerve to action a pioneer in Turkestan, Persia or Arabia, and Central Africa. Mr. Du Chaillu's life was never in the smallest peril from robbers and raiders. His property when left behind was far safer than the trunks of an autumnal tourist on an Italian railway. In fact, the author's only discomforts and trials arose out of the overpowering civility of the people; and here individual egotism is displayed in a manner which amuses and will hardly offend. When once the ice of conventionalism had been broken, there was nothing which householders and farmers, *Lansmen* and *Bonders*, would not do for Paul Du Chaillu, the famous writer and explorer. Every one addressed him familiarly as Paulus or Paul. Hospitality knew no limits, and offers of payment were almost regarded as insults. He was surfeited with meals and interminable cups of coffee. On one occasion he had, to his infinite discomposure, to partake of thirty meals in two days and to swallow thirty-four large cups of coffee; thus completely distancing the celebrated young woman at the Brick Lane Temperance Meeting, whose nine and a half cups of tea occasioned such astonishment in

\* *The Land of the Midnight Sun: Summer and Winter Journeys through Sweden, Norway, Lapland, and Northern Finland; with Descriptions of the Inner Life of the People, their Manners and Customs, and Primitive Antiquities, &c.* By Paul B. Du Chaillu, Author of "Explorations in Equatorial Africa," "A Journey to Ashango Land." 2 vols. London: John Murray. 1881.

the mind of Mr. Weller, senior. More gloves, mittens, and shoes were pressed on his acceptance than would have sufficed for a popular curate or a centipede. When he left a farm or country house the parting was marked by tears, prayers, and fervent wishes for his return. In the course of a year's absence from this land of his adoption he received no less than four hundred letters from the friends he had left behind. One young woman was reduced to despair when she found that she could not accompany Paul Du Chailu to America; and the gift of a ring to another at a social gathering led to rather awkward consequences, and to the inquiries of the father as to Mr. Paul's intentions, which is not to be wondered at, the girl being "very pretty," with "fair complexion and unexceptionable bearing." We are bound to admit that the author's conduct in this and other instances where he was treated as a friend or relative seems to have been correct, courteous, and chivalrous. We note, however, with some surprise, that his innate modesty and diffidence made him uncomfortable under a compliment, and that he discovered, with a feeling akin to wonder, when dressed for a marriage festival in the costume of Dalecarlia, by the aid of a looking-glass, that he was "not ill-looking." His appearance in the church was greeted with a shout of delight. "Look at Paul! he is not proud, he is one of us."

We are quite ready to credit the majority of Swedes and Norwegians with the full amount of the primitive virtues on which the author lays such stress. The gnales were often empty and the criminal courts had no cases to try; articles of clothing or of value dropped or forgotten were faithfully restored. There was a trustfulness and a candour in mothers and daughters which was never abused; and even one peculiar chapter anent the mysteries of the family bath can be read by right-minded persons without a blush. Evidence of wealth was confined to herds of reindeer and comfortable houses and well-ordered farms; in which the beds, coverlets, skins of reindeer, snow-white fleeces, and domestic utensils were scrupulously clean. At the same time we find occasional rude inroads on this Arcadian simplicity. Drunkenness prevailed in some of the seaports, and at feasts and birthdays there seems to have been much more eating and drinking than was necessary, and healths and toasts were incessant. Now and then we have an instance of rudeness or an attempt at extortion, and in Finland the dwellings of the diminutive inhabitants reeked with smoke and were incrustated with filth. Here Mr. Du Chailu's good nature and buoyancy were scarcely proof against dirty coverlets, rotten mattresses, barbarous and offensive customs, and swarms of fleas and mosquitoes. The inconveniences of the former might be borne or obviated; the latter are the pests of northern travel; and there is a local proverb which says that, when a traveller in one year writes his name in a bed of mosquitoes somewhere north of Haparanda, in the following year he sees it again.

One incontestable merit of this work is that it presents to us Scandinavia in her winter dress. Other books have told us of Norway in the summer; the midnight sun, the rapid vegetation, the pure air, the salmon fishing, the red deer, the ryyer, and the willow grouse. Mr. Du Chailu was not content with a view of the sun at the North Cape in July or the deep blue of the Arctic Ocean, and the grass and wild flowers that were then growing in sheltered spots, but he must needs visit this *latas mundi* when under the pressure of *nebula malusque Jupiter*. To accomplish this feat, and indeed to travel at all between October and April, the author had to serve a hard apprenticeship in driving a sledge, managing reindeer, and going on snow-shoes. This latter equipment he pronounces far superior for speed and comfort to the similar article in North America. The shoes are usually six or seven feet long; but in Finland and Jemtland they reach to ten, twelve, and sometimes fourteen feet. The traveller should be careful to wear two pairs of home-made woollen stockings and a covering of Lapp shoe-grass. The great difficulty for beginners is to keep the two shoes exactly parallel. The foot must not be raised, except when going downhill; and in a flat country progress is most facilitated by two staves with a spike at the end, and, above the spike, wicker-work, to prevent the stick from sinking in the snow. The author practised this exercise for several hours every day, as sedulously as the late Lord Campbell practised dancing when at the Bar. A fall or two on smooth unfrozen snow is harmless. A native can go at the rate of from ten to fifteen miles an hour when the snow is in good condition; and a Laplander, it is said, can at this rate get over his hundred and fifty miles in a day of eighteen hours. It was not quite so easy to manage a sledge dragged by reindeer. In the first place, the animal is not the tractable being of children's geographical books. It is wild, restless, and hard to manage, and it takes a couple of years to break in. The reins are attached to the horns, and the deer often kick and plunge and upset the sledge in the snow. Great skill is required to balance the vehicle, especially at a curve or on going downhill, and in some cases it seems necessary to attach one or two animals to the rear to serve as a drag on those in front. A reindeer can go five or six hours without stopping, at the rate of twelve or fifteen miles for the first hour, and the colder the weather the greater the speed. Unlike the Norwegian cattle, they are not housed, live on the celebrated moss, and give a small portion of rich milk. The author was once or twice in some peril from the upsetting of a sledge; but neither wet nor cold seems to have daunted him. He forded rivers, lived on rye bread, tough mutton, and the coarsest of food and condiments; and he never seems to have suffered from frost-bite, cough, or other disease. He had, to borrow an expression from a French writer, a physique of iron wadded with cotton wool.

Amongst other national characteristics, the habit of going to farms in the mountains during the brief summer merits notice. In Norway these are called *seters*, in Sweden they are *fabodars*. The start is made for these lonely residences on the slopes of high hills somewhere about the middle of June. A family, or a couple of girls, take with them churns, pails, wooden vessels, a supply of coffee and bacon, and remain till September, three or four thousand feet above the sea level. A particular kind of grass gives a flavour to the milk, which in one place is pronounced "aromatic," in another "disagreeable." Large quantities of butter and cheese are made and stored, and grass is cut and carted away for the winter supply. The air is singularly pure; but the nights, even in July and August, are very cold; and a peremptory order to abandon the *seter* comes in the shape of a snowstorm in the middle of September, when there is nothing to be done but to pack up pails and churns and make off at once. Here Mr. Du Chailu saw the red snow, which derives its colour from minute vegetable organisms, according to one authority; from animalcules, according to another. Some of the patches so stained were fifteen feet long. On these trips an enormous number of the lemmings were seen. Many are crushed by horses or vehicles; many more are drowned; and, like locusts in the East, these animals lay bare whole tracts of country, and utterly devour moss and grass and the leaves of the willow and the birch. The mention of these mountainous farms reminds us that the lofty ranges of hills are found in Norway alone. Sweden has swamps and forests, and two very large lakes, the Wenern and the Wettern; but it is not strictly a mountainous country. The Swedish *fabodar* is often a hamlet round which grain is grown in fenced fields. The Norwegian *seter* is lonely; and the house, though scrupulously clean, is a mere chalet of the roughest build.

There is an interesting chapter on geology, glaciers, and the upheaval of the country, which is calculated to go on at the rate of  $2\frac{1}{2}$  feet in a century. Glaciers in Norway both increase and decrease, and the largest are found south of the arctic circle, where more snow is melted by the summer sun, to be converted into solid ice by the succeeding frosts. The limits of perpetual snow, from the statistics collected by the author, vary, according to latitude, from about 5,000 to 2,500 feet. The water of a glacier is turbid, being mixed with dirt, *débris*, and sand. We are not at all sure whether Mr. Du Chailu has correctly apprehended the system of land tenure in Scandinavia; but he informs us that Sweden, like other countries, is threatened with the abolition of the law of entail. The Swedish aristocracy have splendid castles and country seats. Around some of these there are moats and stately avenues of trees, flower-gardens and greenhouses. We must, however, confess to our ignorance of the fact that Claude Lorraine was a Swedish artist; and we should have liked a note or two on the special gems of Itassalle, Rubens, Correggio, and a tremendous list of Continental painters—Italian, Dutch, Flemish, and others—who have filled these aristocratic residences with perfect treasures of art. There is a want of accuracy in the use of the terms "estates" and "farms"; but we take the two phrases to be identical, and gather that, owing to primogeniture, property has remained for centuries in the same families; and that when a property is sold to a stranger, any one member of the family may repurchase it within ten years. If this be correctly stated, we can understand that it operates as a bar to the investment in land by capitalists and bankers. But we must say that the author's phraseology about homestead rights and allodial interests is hazy and peculiar, and that we much prefer him on his congenial subjects of adventures in the forest and of fireside talk. We trust that his satisfactory statistics of schools are trustworthy. Sweden has more than twice the population of Norway; in both the education of the masses is cared for; and though there are School Boards, we do not make out that any of the members entertain any doubts about allowing the Bible to be taught or hymns to be sung in the *folkakolor* or people's schools. But then the Scandinavians are not yet "advanced thinkers." To suit the needs of the community scattered over a large area, there are what are termed ambulatory schools. Teachers go from place to place at stated periods, and the local farmers are bound to provide rooms for the scholars as well as to board the teachers while the instruction lasts. As we read the text, the teacher is ambulatory; the school is stationary, though not permanent, and never moves so long as the teacher stays at one place.

The fault of want of connexion in these two volumes perhaps may strike a critic much more than a general reader. Mr. Du Chailu is, however, far too fond of recurring to favourite topics. More than once he gives us long strings of the pretty names of women—Karin, or Carin, Lovisa and Erika, Nina and Ulrica. Amongst males we have Dodrick and Frithioff, Hildmar and Sigurd, Valfrid, Tryggve, Staute, and Egil. There was no reason why these should not have been compressed into a single page or note. But we are bound to say that, in spite of redundancy, repetition, and reiteration, these two volumes contain a great deal which demands attack and merits consideration, and that they add to our knowledge of a country now growing in favour as a summer resort. We trust that tourists will imitate the author's good-humour, intelligence, and kindly feelings for the natives, and will not endeavour in a tour of a few months to compass what it has cost him some years of toil and endurance to effect.

## MARY STUART.\*

MR. SWINBURNE'S *Mary Stuart* completes the trilogy of which *Chastelard* and *Bothwell* were the first two parts. Upon the quantities of these it is needless to go back in detail; but it may be said that there is some ground for disappointment as regards *Mary Stuart*. The play is, as it strikes us, undramatic, by which we do not mean merely untheatrical. If it does not "lose the name of action," yet the action moves so slowly, and at such length, that the interest of a reader cannot but flag at some points where it should be most aroused. The verse is throughout fine, and it need hardly be said that many passages are striking, and in every sense worthy of their author; but they are, on the whole, outweighed by the mass of mere talk, which is indeed framed in words that are fine in the best sense, but are superfluous, so far as the development of character and action is concerned. The poet seems to have been seized with a strange love of writing at great length merely for its own sake. The first long speech delivered by Mary herself is long indeed. It consists of two sentences. The first contains ninety-three lines, the second nine; and the first is almost as difficult as Thucydides, and hardly so interesting. The speech is objectionable on other grounds, to which we may recur, but its mere length and intricacy are discouraging. It is not every man who can write a sentence of this length so that it can be proved to be coherent, and it is not every man who can play on a one-stringed fiddle. Mr. Swinburne's accomplishment in the matter of long sentences is displayed too frequently in the course of his latest volume; but this is perhaps the most striking example of it, and it is not altogether fortunate that so remarkable a string of words should be placed so early in the mouth of his heroine. Faults of this kind, however, would be better endured but for the fact that the qualities of fire and passion which used to inform Mr. Swinburne's verse—and did so notably in *Atalanta in Calydon* and in *Brechtheim*—seem, in great part, to have deserted him in *Mary Stuart*. In the actual planning of the play Mr. Swinburne has departed, not, perhaps, with the greatest advantage, from the lines of his predecessors who have handled the same subject. In *Chastelard*, it will be remembered, Mary Beaton is represented as being desperately in love with Chastelard. "What is this they say?" she cries, just after his execution.

*So perish the queen's traitors! Yea, but so  
Perish the queen! God, do thou much to her  
For his sake only; yea, for pity's sake,  
Do thou much with her.*

In the first act of *Mary Stuart* the Queen asks Mary Beaton, concerning a letter to Elizabeth,

Dost thou mind  
The letter that I writ nigh two years gone  
To let her wit what privacies of hers  
Our trusty dame of Shrewsbury's tongue made mine  
Here it took fire to sting her lord and me?  
How thick and o'er o'ercurled with poisonous lies,  
Of her I am sure it lied not; and perchance  
I did the wiselier, having writ my fill,  
Yet to withhold the letter when she sought  
Of me to know what villainies had it poured  
In ears of mine against her innocent name:  
And yet thou knowest what mirthful heart was mine  
To write her word of these, that had she read  
Had surely, being but woman, made her mad,  
Or haply, being not woman, had not. 'Faith,  
How may'st thou? did I well?

*Mary Beaton.* Ay, surely well  
To keep that back you did not ill to write.

*Mary Stuart.* I think so, and again I think not; yet  
The best I did was bid thee burn it.

Now, so far from having burnt it, Mary Beaton has kept the letter as a possible weapon wherewith to avenge Chastelard's death, and it is the production of this letter which, after Elizabeth has gone through some somewhat weary scenes of indecision, decides her finally to sign Mary's death-warrant. There is, it seems to us, a tinge of paltriness in this; nor do we greatly admire the means which the poet employs to point Mary Beaton's wavering purpose to send the letter, and thus ensure the death of the Queen, who has for years believed in her fidelity and affection. In the fourth act Mary Stuart refers again to the letter, wondering what effect it might have had if it had been sent.

*Mary Beaton.* Certainly,  
I think that soul drew never breath alive  
To whom this letter might seem pardonable  
Which kindly you forbore to send her.

*Mary Stuart.* Nay,  
I doubt not I did well to keep it back—  
And did not ill to write it: for God knows  
It was no small ease to my heart.

*Mary Beaton.* But say  
I had not burnt it as you bade me burn,  
But kept it privily safe against a need  
That I might haply sometime have of it?

*Mary Stuart.* What, to destroy me?

*Mary Beaton.* Hardly, sure, to save.

*Mary Stuart.* Why shouldst thou think to bring me to  
my death?

*Mary Beaton.* Indeed, no man am I that love you; nor  
Need I go therefore in such fear of you  
As of my mortal danger.

*Mary Stuart.* On my life,  
(Long life or short, with gentle or violent end,  
I know not, and would choose not, though I might  
So take God's office on me) one that heard  
Would swear thy speech had in it, and subtly mixed,  
A savour as of menace, or a sound  
As of an imminent ill or perilous sense  
Which was not in thy meaning.

*Mary Beaton.* No: in mine  
There lurked no treason ever; nor have you  
Cause to think worse of me than loyally,  
If proof may be believed on witness.

*Mary Stuart.* Sure,  
I think I have not nor I should not have:  
Thy life has been the shadow east of mine,  
A present faith to serve my present need,  
A foot behind my footsteps; as long since  
In those French dances that we trod, and laughed  
The blithe way through together. Thou couldst sing  
Then, and a great while gone it is by this  
Since I heard song or music.

The Queen goes on to ask Mary Beaton to sing, and she in a speech aside announces that according to the Queen's memory of the song her fate shall be decided, and then sings the beautiful song in *Chastelard*, beginning:—

Après tant de jours, après tant de pleurs,  
Soyez secourable à mon âme en peine.

Mary Stuart tells her that she has some recollection of the song. "Was it—but his rang sweeter—was it not, Remy Belleau?"

This answer decides the treacherous Mary Beaton to send the fatal letter. Queen Elizabeth's speech when this letter is put into her hands is open to the same objection which we have referred to in connexion with the inordinately long speech of Mary Stuart at the beginning of the play. It is riddled with the most horrible language. Mr. Swinburne may plead in defence of this, that it is, according to his view of the matter, *dans la nature*. But he would do well to remember the very pertinent saying of Voltaire on this matter, a saying which was coarse enough in itself, but hardly coarse in comparison with the tendencies at which it was aimed. It would, perhaps, be absurd to suspect Mr. Swinburne of being influenced by the silly rubbish that is talked by M. Zola and his so-called school; but he has certainly done himself less than justice in putting into the mouths of two such important personages as Elizabeth and Mary speeches which have a rank flavour of Billingsgate. Shakespeare, who lived in an age which was sufficiently coarse in its language, was far more reticent in this way than Mr. Swinburne has been in *Mary Stuart*. But, apart from this, it seems to us, as has been said, a mean thing to represent Elizabeth as a vacillating person, anxious at one time to have Mary Stuart privily done to death, at another desirous to sign a formal death-warrant, at yet another shrinking from setting her seal to it, and finally moved to do so, in a towering and most unqueenly passion, by reading a report by Mary Stuart of what "the dame of Shrewsbury" has said, in terms more than plain enough, to her discredit. Indeed, the characters of Elizabeth and Mary, as of other comparatively subordinate personages, are shown forth but ineffectively in the words that they themselves speak. From Mary's own words and deeds we should be at a loss to know with any certainty in what light the author wished to represent her; but there is one thoroughly admirable speech concerning her put into the mouth of Sir Drew Drury:—

*Drury.* Nay, myself  
Were fain to see this roll wound up, and her  
Removed that makes it: yet such things will pluck  
Hard at men's hearts that think on them, and move  
Compassion that such long strange years should find  
So strange an end: nor shall men ever say  
But she was born right royal; full of sins,  
It may be, and by circumstance or choice  
Dyed and defaced with bloody stains and black,  
Unmerciful, unfaithful, but of heart  
So fiery high, so swift of spirit and clear,  
In extreme danger and pain so lifted up,  
So of all violent things inviolable,  
So large of courage, so superb of soul,  
So sheathed with iron mind invincible  
And arms unbreached of fireproof constancy—  
By shame not shaken, fear or force or death,  
Change, or all confluence of calamities—  
And so at her worst need beloved, and still,  
Naked of help and honour when she seemed,  
As other women would be, and of hope  
Stripped, still so of herself adorable  
By minds not always all ignobly mad  
Nor all made poisonous with false grain of faith,  
She shall be a world's wonder to all time,  
A deadly glory watched of marvelling men  
Not without praise, not without noble tears,  
And if without what she would never have  
Who had it never, pity—yet from none  
Quite without reverence and some kind of love  
For that which was so royal. Yea, and now  
That at her prayer we here attend on her,  
If, as I think, she have in mind to send  
Aught written to the queen, what we may do  
To further her desire shall on my part  
Gladly be done, so be it the grace she craves  
Be nought akin to danger.

For the rest, Mr. Swinburne has avoided any attempt to give any relief of comedy to a play which has a sombre tone throughout.

\* *Mary Stuart: a Tragedy.* By Algernon Charles Swinburne. London: Chatto & Windus. 1881.

and which is in some parts tedious, but of which the cardinal fault seems to us to be that it fails to reach the height and grandeur of true tragedy, by reason chiefly of the littleness of motive which is employed to bring about tremendous events. Perhaps the best consecutive passages are to be found in the closing scene. Here, as in *Chastelard*, Mary Beaton finds herself unable to witness the execution, and we learn what is going on from a bystander who makes report to her. In this there is certainly a fine tragic irony, but the effect is injured by the inadequate treatment through the play of the character of the woman who thus avenges the execution of the man whom she had loved.

#### THE PORTRAIT OF A LADY.\*

THIS novel, which is one of the most careful and elaborate that the author has hitherto published, will maintain, if it will not materially increase, his reputation. It is marked by the same merits and the same defects which are to be noticed in nearly all that he has written. There is the same minute and accurate observation, the same adroitness in keeping the reader's curiosity, if not always his interest, alive to the end, the same ingenious analysis of superficial feeling and motive. But in *The Portrait of a Lady*, as in so much that Mr. James has written, we cannot help remarking the care which the writer takes not to go down, if he can possibly avoid it, below the surface of his characters and of the situations in which he places them. And in those cases where he cannot escape doing so, he seems at once to lose hold of the characters whose outward and superficial qualities he depicts with so much ability. The real nature of his characters, which should appear most clearly in serious and critical situations, seems at such times to have no connexion with what he has told us of their past history. Mr. James devises a plot skillfully, and leads us up to a crisis where all our expectation is awake; but when the moment for action comes, he evades the catastrophe altogether, either—which is his most common method—by making his actors do nothing at all, or by making them do something which seems to be prompted by no reasonable motive. In either case he frustrates the curiosity of the reader, and leaves him with the sense that the plot, however ingenious, breaks down at the critical moment. Mr. James has certainly many of the qualities of a fine novelist; but his reluctance to go below the surface, or to grasp a character as a whole, renders his short sketches and little episodes more successful than his longer works. For the same reason his subordinate characters, with whom he only pretends to give us a casual acquaintance, are more satisfactory than the chief actors, with whom we naturally desire a more intimate knowledge. Mr. James's method evades the main difficulty of a novelist's art; but it also cuts off the writer who uses it from attaining the highest success.

Isabel Archer, the lady whose portrait is drawn in these volumes, is the orphan daughter of a gentleman at Albany, in the State of New York. She is left poor, and her prospects are anything but brilliant, when she is invited by her aunt, Mrs. Touchett, the wife of an American banker living in England, to spend a few months under her charge. Mrs. Touchett, it should be premised, is a lady who does not think it a part of the conjugal duty to be in frequent attendance on her invalid husband. His bank is in London, and his country place of residence is Gardencourt, on the Thames, some miles from London. The lady, however, has an establishment in Florence, and occasionally drops in for a stay of uncertain length at the country house, sometimes on her way to or from America. She is an unfeeling, matter-of-fact, uninteresting person, who serves chiefly as a foil to the other characters of the book. The two most pleasing of these are her husband, a shrewd, kindly, long-suffering old gentleman in feeble health, and their son, Ralph Touchett, a young man of a whimsical turn of mind, in still feebler health, gifted with a good deal of wit, character, and generosity. Isabel and her aunt arrive unexpectedly from America as the father and son are lounging in the garden with Lord Warburton, a young nobleman who plays a prominent part in the book. What Isabel's charm is we can hardly make out. She is young, pretty, imaginative, and apparently has the faculty of striking her company as a girl of much depth and strength of character. She is, in truth, a rather selfish and heartless young lady, who acts as if the world were arranged in order to satisfy the claims of her imagination. She succeeds, however, in the course of the story in making three men deeply in love with her, and in making a fourth marry her; not, however, by in any way intentionally drawing them on, but simply by the impression her personality makes upon them. Where the charm lies the reader cannot easily discover, and he is in no way helped in his endeavours by any explanations of the writer. The first of Isabel's victims is a young American, Caspar Goodwood, whom, it appears, she had encouraged in his suit before she left her native country. The next two are Lord Warburton and Ralph Touchett, the former of whom declares himself after he has known her a few days, and who, notwithstanding that he is a young English patrician of the most wholesome and eligible sort, is rejected, on the ground, apparently, that the lot he offers her is too circumscribed, and does not promise enough of the unforeseen for her imagination to feed upon. The third lover, Ralph Touchett, makes Isabel no offer of marriage, which his state of

health puts out of the question; but gives her to understand what his feelings towards her are, and follows her career partly with the chivalrous devotion of a lover whom circumstances forbid to seek to be more than a friend, and partly with the speculative curiosity of an active mind condemned by physical weakness to play the passive part of a spectator of the life of others. We are given to understand that Isabel is one of the striking, complex, and problematic natures which repay such a study; but the reader can hardly help feeling that the chief point of interest in her is that we cannot quite tell what she will do next. However, her lack of defined motive passes with all her admirers as a sign of depth and originality. Isabel's stay in England is brought to a close by the death of her uncle, who, at Ralph's suggestion, leaves her a handsome fortune; after which event the scene changes to Italy. Here Isabel, who has hitherto brought disappointment to all her lovers, becomes in her turn the victim. In Italy she falls in with Gilbert Osmond, a Europeanized American, who lives in a villa near Florence. The most salient feature in this gentleman's character is that he looks on life purely as a matter of taste; and Isabel, being a handsome young lady, and the owner of seventy thousand pounds, is precisely the acquisition to be desired by a needy connoisseur of cultivated and expensive tastes. The character of Osmond—a selfish, heartless, accomplished, and still ineffective man, reminding one in a good many points of George Eliot's Grandcourt—is one of the most successful in the book. In the teeth of the remonstrances of her aunt, Mrs. Touchett, and of her still faithful lovers, Ralph Touchett and Caspar Goodwood, Isabel, after once refusing Osmond, marries him at last. As to Isabel's change of mind, and the means Osmond takes to bring it about, we are left altogether in the dark. A year or so is supposed to elapse after the refusal, and we are then re-introduced to Isabel as an engaged woman. Surely if the portrait of Isabel's character is to be a living one, we ought to see something of the mental processes which decide her to take the gravest step of her life. Caspar Goodwood, a powerful, energetic, positive, commanding nature, is rejected; Lord Warburton, a generous, manly, attractive, and every way eligible suitor, is rejected; Ralph Touchett, different from both, but quite as noticeable in his way, is hardly ever thought of as a man to be loved. The trains of feeling and association which lead a good and clever woman to prefer to type a like these a person of Osmond's stamp, and the illusions she must create for herself before she can do so, are precisely the subjects on which a skilful analyst of human nature should be able to throw some light; but it is just here that Mr. James leaves us most in the dark. We can only wonder that a situation should be devised so cunningly on purpose, as it almost seems, to be made no use of.

One of Mrs. Touchett's friends, whose acquaintance Isabel makes first in England, is a widow lady, Madame Merle. She is, like Osmond, a Europeanized American; like him, she has lost her partner in life; and it is she that fosters the intimacy between him and Isabel. It is not till long after her marriage that Isabel begins to imagine that there has been anything more than a friendly relation between them; and it is not till the close of the story that Isabel finds out what was her chief motive for bringing about the marriage. Madame Merle is a lady whose antecedents have been questionable, but who has had the art so to veil them from the world that she is received and welcomed in the best society all over Europe. Osmond, when he marries Isabel, has a daughter just budding into womanhood, who, a couple of years after the marriage, becomes herself of an age to have suitors. Two present themselves—one a Mr. Rosier, an inoffensive young American addicted to *bric-à-brac*, who wins the girl's liking, and the other Lord Warburton, who vicariously transfers to Pansy the solicitations which he once addressed to her stepmother. Osmond discountenances Rosier's suit, and does his best to promote the interests of Lord Warburton. The plot at this stage becomes exceedingly intricate; everybody is playing a game, and most of the players a double game. The old lovers reappear upon the scene, and all of them, intentionally or not, combine to trouble the domestic affairs of Isabel. She has soon learned to dislike and despise her husband, and her dislike, if not her contempt, is heartily returned by Osmond. At last the crisis arrives. Ralph Touchett is taken back from Rome, where the need to be in a warm climate and near Isabel had driven him, to die at the old home in England. Mrs. Touchett telegraphs to Isabel that he would like to see her, and in defiance of Osmond's wishes, Isabel quits her husband and goes to visit her dying cousin and lover. Before leaving Rome she finds out that Pansy, her stepdaughter, is the illegitimate child of her husband and of Madame Merle, and discovers that ever since she made the acquaintance of this interesting lady she has simply been unconsciously her tool.

Ralph dies. His deathbed interview with Isabel is described with graceful and delicate feeling. She now makes no pretence that her marriage has not been a disappointment to her. Since her arrival in England she has neither heard from her husband nor written to him; and now her earliest lover, Caspar Goodwood, reappears once more on the scene, and urges her to give up all thoughts of returning to Osmond, and to commit herself to him. Isabel seems to waver; but when Caspar seeks a second interview he finds that she has started for Rome. The story closes enigmatically. Caspar receives the news of her departure from a friend of Isabel's, Henrietta Stackpole, and as he turns away in surprise, "Look here, Mr. Goodwood," she said, "just you wait." Upon which he looked up at her. With these words the book comes to an end. In what way

\* *The Portrait of a Lady*. By Henry James, jun. 3 vols. London: Macmillan & Co. 1881.

this crisis in Isabel's married life ends, what becomes of her, of her husband, of Onapar, of her stepdaughter Pansy, or of Madame Merle, we are not told. So far as the development of the plot goes, the tale might end at the close of the first or of the second volume just as well as of the third. We are carefully prepared for a catastrophe, and just before it comes off the curtain falls. As we said before, till the time for action comes Mr. James's men and women are admirable imitations of human beings; but the moment the hour arrives for decision and deeds, they reveal themselves as mere *simulacra*. And this defect, which is characteristic of most of Mr. James's works, is nowhere more conspicuous than in his latest book.

Many of the minor characters in the book are admirably sketched. Perhaps the best of all, though she can hardly be called a minor character, is Isabel's friend, Henrietta Stackpole, an American newspaper correspondent, who from time to time appears in Europe to give Isabel counsel and to study the civilization of the old world. Madame Merle, too, is excellent till we come to her deeper motives, and then she too loses her individuality. The most disappointing figure of all in the book is that of the lady whose portrait is the chief subject of it. But the tale, like all that Mr. James writes, abounds in the quickest observation and the happiest description; and if we are compelled to find fault with it in some important respects, it is chiefly because its decided merits tempt us to ask for more.

#### WITH THE CAPE MOUNTED RIFLES.\*

WE have had more than enough of books on the South African campaigns by soldiers, civilians, and colonists turned volunteers. But the volume before us comes from a fresh point of view, being the experiences of a full private in the Cape Mounted Police, and it chiefly concerns itself with the fortunes of the corps. The narrative is written in a lively style, and is sufficiently full of incident to make it agreeable reading; while the descriptions of some of the engagements, and especially of the siege laid to "Morosi's Mountain," are clearly intelligible and often picturesque. Like most soldiers—or policemen, we suppose—who consider that their services have been undervalued, the author is something of a grumbler. But when he states the grievances that were generally complained of in his corps, he quotes facts in support of his assertions; and if he deals hard measure to some officers who held important commands, he can be liberal of the commendation he bestows upon others. We might have thought that the chances of rough frontier campaigning were rather a risky remedy for an enfeebled constitution. Yet it was chiefly with the idea of benefiting his health, injured by a sojourn on the West Coast of Africa, that the author thought of enlisting in the "Frontier Armed and Mounted Police in the Cape Colony." The programme of attractions issued by the colonial recruiting agent was as seductive as the style of the force was imposing. As it turned out, both were delusive. The performance of the Colonial Government is said to have fallen far short of its promises; while, shortly after the author had joined, the name of the force was arbitrarily altered, with the duties it had undertaken to discharge, much to the disgust of the men. Whatever he might have hoped from the climate of the Cape, the circumstances of the voyage thither, as he describes them, were scarcely favourable to an invalid. With two-and-twenty other recruits he was shipped on board a steamer, and found himself among an exceedingly mixed lot of companions, who seem to have ranked beneath the ordinary steerage passengers. These companions consisted principally of rough navvies; they "never had any meal without a light for it," when, of course, the weakest went to the wall. We can imagine no better training for a zealous officer destined to deal with disorderly characters, yet we can believe that the author had quite enough of it in the course of a tedious twenty-eight days' voyage. Disembarking at Cape Town on their way to East London, they had an acquisition to their party in six of "the most unmitigated ruffians it has ever been my lot to encounter." As might be supposed, the six gentlemen in question proved highly unsatisfactory bargains to the Cape authorities. Their first exploit on landing at East London was to inflict a savage beating on the sergeant in charge of them. And the author mentions, by way of illustrating the discipline observed in the force at that time, that when the ruffians were tried for the aggravated assault, they were let off with a fine of half-a-crown and a caution. In fact, the officers appear to have lived in terror of their men, who were certainly as mutiniously independent a set as we can conceive. The old hands advised the novices on joining never to do anything that they could help, as, if they showed themselves willing, they were sure to be put upon; which the author found by experience to be perfectly true. The punctuality which is the soul of discipline, as well as the politeness of princes, was totally neglected; the men were sent on duty when it suited the sergeants, and there were no particular hours for meals. Their leisure might have hung less heavy on their hands had they had more spending money. But, though five shillings *per diem* sounded handsome, there were many serious deductions for stoppages. The men had nothing free but arms and ammunition; they found themselves in everything else. Nay, they had actually to build their stations at their own expense; and the dealers who purveyed their horseflesh

were supposed to make an excellent thing of it by a friendly understanding with the officers. Possibly common report did the officers injustice; but the system by which a man was bound to replace his horse in case of a casualty, receiving a maximum of 14*l.* from the Government, seems to have been open to grave objection. The average cost of a charger was 25*l.*, although it is said that the ordinary value was very much less. So that, as the trooper who had his horse killed in action was virtually fined 9*l.*, he had strong inducements to keep the animal out of harm's way. We are bound to add that, on the corps being transformed into Mounted Rifles, when it was more carefully drilled and better commanded, selfish considerations of the kind do not seem to have weighed with it. The men did a great deal of useful service against overwhelming numbers of the natives; and the artillery troop in particular, to which the author was attached, appears to have attained a high degree of efficiency.

The author's opinion of the natives is far from complimentary, which is not astonishing considering that, while in the Rifles, he passed his time in fighting them, and that they subsequently burned him out of a snug homestead in which he had invested his modest capital. As they have cost us much anxiety and money in the past, he entertains no manner of doubt that they will give us infinite trouble in the future. But he believes that we might have escaped most of our recent little wars had the authorities listened in time to warnings or read significant signs. It may be laid down as an axiom, he says, that a rising is coming off when the Kaffirs are selling their oxen and buying arms. One consolation we have in dealing with them—that they are always ready to quarrel with each other on slight provocation, and are unlikely to combine, even for the common object of exterminating or expelling the detested whites. And he hints his approval of a thoroughgoing, though passive, policy founded on the Iliberian legend of the Kilkenny cats. As he explains his opinions as to the best method of dealing with the Kaffirs in language that may perhaps lay him open to misconception, we may as well let him speak for himself:—"They [his opinions] do not differ very much in respect of improving the natives from that of the American with regard to the Indians, whom he would have improved off the face of the earth." He is certainly not in the habit of mincing matters, when expressing his ideas as to men or things. Here is the character he gives of our ally and *protégé*, Gangeleswe, the headman of the Tambookies, though, if all he has to tell of him be true, we do not know that the portrait is overcoloured:—"This chief is the most cowardly, contemptible nigger in the whole of South Africa; in fact, I doubt if his equal in these respects is to be found in any country or clime." But, on the other hand, he can do justice to a brave enemy, even when stained with the worst vices of the savage. He bestows high praise on Sigow, one of the chiefs of the Galekas, who was notorious for his intense hatred of the white men. Sigow always showed to the front in the bush-fighting, and, although frequently wounded or nearly captured, he appeared to bear a charmed life. But the author, while holding most of the native races in contempt, speaks warmly of the warlike qualities of the Galekas, and he had many opportunities of judging them. He has seen them come on, time after time, in most determined rushes; and more than once they were only checked at a critical moment by the superiority of the English rifle and artillery fire. Consequently he strongly condemns the policy which has invited them to settle again near their own country, where they are in easy communication with their formidable old leader. Krelé appears to have inspired his people with something of the blind devotion which the clansmen of the Scottish Highlands paid to their chiefs. Galekas earning good wages in the service of colonists have been heard to confess that they would make a point of obeying Krelé's summons were he again to try the fortune of war. And we happen to know, on good authority, that most of the Galekas who have settled under our magistrates can lay their hands upon concealed firearms at a moment's notice; while the Fingoes, who have given convincing proofs of their loyalty, have been very effectually disarmed.

We have said that the story of Morosi and his mountain is very picturesquely told; and the moral of it is that in time of peace we should guard against prospective troubles by keeping a sharp eye on suspicious proceedings. Morosi owned a narrow strip of territory, with comparatively a mere handful of people. He had received it from the chief of the Basutos as a reward for distinguished services in the Basuto war of 1853. The veteran savage seems to have been a born strategist, and he had a very pretty natural turn for engineering operations, as the colonists were to learn to their cost. To make a mountain impregnable by cleverly devised fortifications had always been a mania of his, and he very nearly achieved the feat. The position was well chosen with a view to throwing difficulties in the way of a protracted siege; while he might well have brought himself to believe that it was safe from a *coup de main*. There were no roads in the surrounding country, and pasturage was scarce. The rocky hill itself rose so abruptly out of the plain as to be absolutely inaccessible on three of its sides. On the top, however, was a spacious tableland, which could accommodate all his people, with their families and herds of cattle; while he had laid in large supplies of food and ammunition. No pains or labour had been spared in fortifying the fourth side, which slopes at an angle of thirty degrees. A series of strong parallel walls had been built along it, each of them dominating the one beneath. They were from eight to twelve feet high, were loopholed for musketry, and it was practically impossible to

\* With the Cape Mounted Rifles; Four Years' Service in South Africa. By an ex-C. M. R. London: Bentley & Co. 1881.

breach them by any artillery fire that could be brought to bear. The siege for some time seemed wellnigh hopeless, and half-hearted assaults only ended in failures. For the Baphutis, we are told, are splendid shots, and they must have been well armed, so that it was certain death to venture within five hundred yards of the first "schanze." Apparently the blockade must have been indefinitely protracted or given up in despair, had it not been for the happy thought of bringing up a venerable mortar, which dated from 1802. Fortunately there were plenty of shells, but the gunners had to adapt makeshift fuses to them. The mortar was placed in charge of the author, with six men acting under him. During four days and nights a steady discharge was kept up at intervals of ten minutes. The shells, falling on the steep side of the mountain, rolled backwards down the slopes and exploded among the defenders, who had hitherto sheltered themselves behind their schanzen. The plucky Baphutis became demoralized, and the way was smoothed for a surprise with scaling ladders. The assault came off at a natural fissure in the rocks, which had left a flaw in the chief's system of defences; the Baphutis were taken almost unawares, the schanzen were successively turned; and, with considerable slaughter of the defenders, Morosi's stronghold was in the hands of his enemies. Certainly the author's services with the improvised mortar battery would appear to have deserved recognition and recompense. But he complains that he went altogether unrewarded; that the Mounted Rifles were not even thanked for doing, with the aid of a few Kingoes, what the colonial volunteer forces had failed to accomplish; and that the colonel in command, who had reaped all the honour, actually never set foot on the mountain. At the same time, we do not understand that the author disputes Colonel Bayley's claim to have devised and successfully directed a daring and most ingenious attack.

#### COOKE'S FREAKS AND MARVELS OF PLANT LIFE.\*

WE gladly welcome every well-directed attempt to make accessible and attractive to the public the most prominent results of recent scientific research in each special department of nature. Among books of this class a place of merit is due to Dr. Cooke's handy little volume on the curiosities of vegetation, designed to present in a popular form—devoid as much as may be of technical language—some of the most noteworthy fruits of the latest investigations into the phenomena of vegetable life. In his introductory remarks the writer expresses some dread of being taken to task for the use he has freely made of Mr. Darwin's researches without materially adding to them from resources of his own. But the truth is, so exhaustive are the labours of our great naturalist, whatever the field on which he enters, that there remains but scanty gleanings for any one who comes after him; and the best service left for lesser workers is to diffuse and popularize the stores of knowledge which make his volumes a cyclopædia of biological facts. There is a second objection which Dr. Cooke modestly anticipates, resting upon the miscellaneous character of the subjects comprised in his book. Writing, however, as he professes to do, in a popular style, he may fairly plead the necessity of interesting those who are not botanists, and to whom facts of a novel, curious, and attractive kind are more welcome than methodical and systematic lessons in the science of botany. He cannot in fairness be accused of sacrificing truth to the mere excitement of wonder, or of pandering to the ignorant craving after paradox; and his book is fitted to kindle in a wide class of readers an interest in plants and flowers such as they never felt before. Some elaborate investigations—as, for instance, those in fertilization—of great interest to botanists, have been excluded, as little suited to be understood or appreciated by the general public; whilst, on the other hand, subjects which have not been exhaustively examined and reduced to the standard of scientific knowledge have been held to fall legitimately within the scope of his undertaking. Free use has been made of every source of information, the writer feeling convinced that the more experiments of this kind are known and understood the greater and more general will be the appreciation of the labours of those who have contributed to the elucidation of obscure phenomena in plant life.

It is difficult to form any adequate conception of the vast extent and unlimited variety of vegetable life, or to estimate the grandeur and beauty which it has conferred upon the world. Our author can only bid us pick up here and there some object of special interest, gaze at it, marvel at it, try to comprehend it, and then pass on, leaving behind an infinity of wonderful and beautiful things, to be picked up by our successors, and marvelled at as they have been by us. He quotes the saying of a travelled naturalist, that the feeling of one who penetrates an extensive wild forest is much the same as that of one on a sea voyage—surprise at the interminable character of the scene. The chief difference between the two is that the one is a sea of waters, the other a sea of trees. Illimitable, however, as the ocean of vegetable life may be, it is not to be called monotonous. The mind wonders at the multitude of living things, asks whence they can have drawn nourishment to rear such solid, delicate, and complex structures, speculates on their age, their formation, or

their use. The first question to arise will probably be that which our author puts as a prelude to his subject—what number of different kinds or species of plants may be supposed to exist on the surface of the globe? The progressive estimates of these numbers from age to age, which he proceeds to give, furnish a curious chapter in history. Thus Theophrastus (300 B.C.) enumerates 500 kinds of plants. These may be presumed to represent all that were then known. Even narrower, it is possible, was the botanic knowledge of Solomon, though he discoursed on all plants, from the cedar of Lebanon to the hyssop on the wall. Pliny (A.D. 79) increased the number to double that of the Greek naturalist. By the beginning of the seventeenth century the catalogue had grown to 6,000. The second edition of Linnæus's great work included no more than 8,800, but from the impulse given by his labours the progress became rapid. Willdenow up to 1807 had distinguished 17,457 species of flowering plants, Robert Brown carrying on the number to 37,000, and Humboldt calculating all plants, flowering and non-flowering, at 44,000. By 1820 De Candolle had set down 56,000 at the least, to which figure the collection in the Herbarium of the Jardin des Plantes was not long after brought up; that of M. Delessert reaching in 1847 as many as 86,000 species, at which number Dr. Lindley had estimated in 1835 all the plants in the world. About this time Humboldt's advanced calculations seemed to him to verify the ancient myth of the Zend Avesta, that the creative primeval force called forth 120,000 vegetable forms from the blood of the bull. In 1845 the total species of phanerogamic and cryptogamic plants were set down by Mr. R. B. Hinds as 134,000, by Henty in 1857 at 213,000, whilst in 1855 De Candolle could extend the full number of flowering plants to 375,000. With the knowledge of new lands and their varied flora, the numbers may be expected to grow indefinitely. The problem is of course enhanced in difficulty by the vagueness of the line defining specific differences; but at the present time it may be thought a safe estimate to say, with our author, that there are probably not less than half a million distinct species of vegetable organisms on land and in the water dispersed over the globe.

Out of this vast store of vegetable life Dr. Cooke selects for illustration some score or so of groups or species less familiar to the ordinary observer of nature, or more remarkable for their bearing upon the general laws of organic life. First in order come the carnivorous plants, which were for the first time made the subject of systematic research by Mr. Darwin a few years ago. A popular summary is given of his experiments upon the sundew (*Drosera rotundifolia*), to be met with among bog-mosses and in other swampy places. The structure of this curious little plant is made clear by well-executed woodcuts, and the action of the glands in seizing and disposing of the insects that form its natural prey described in detail. The nature of the viscid secretion from these glands has been shown by chemical analysis to correspond with the gastric fluid in animal forms. It completely dissolves albumen, muscle, fibrin, cartilage, the fibrous portion of bone, gelatine, and the casein of milk, precisely in the same way as these are acted upon in the process of digestion in the stomach of animals. In the power of the tentacles to close upon their prey, and in their response to irritation, we see a resemblance to sensibility in the animal kingdom, as well as in their power of distinguishing between organic and inorganic substances, as between a piece of glass and a piece of boiled egg, or between a hard-skinned beetle and a soft fly, also between different kinds of fluids, acids, and alkalies. And not only do these tentacles bend over and grasp the insects or other objects brought into contact with them, but on living flies being placed half an inch away from the leaves, the tentacles have been found to bend gradually towards the insects, closing and gripping them fast within two hours or so in their bristly and viscous embrace. On the flies being removed three-quarters of an inch further off, the leaves still remained bent towards them away from the direction of the light, though failing to reach them—indicating the presence of an appetite in plants. Of the true sundews no less than three hundred species have been discriminated, of which three are met with in England. Australia has yielded two, and others have been met with not only over the whole of Northern Europe, Canada, and the United States, but as far apart as Brazil and Australia. Kingsley speaks of his rapture at coming upon the familiar little plant among the tussocks of Trinidad, with its clawy-haired paws full of dead flies, just as they would have been in any bog in Devonshire or in Hampshire, in Wales or in Scotland. How came about this world-wide dispersal? Possibly, the author thinks, by means of ancient landways connecting the existing continents, which gave unbounded spread to both flora and fauna, but more probably the minute germ was carried on the feet or in the crop of birds. Hardly less interesting is what Dr. Cooke has to say of *Dionaea muscipula* (Venus's fly-trap), belonging to the same natural order of plants as sundews, not a native of the British islands, but dwelling in the damp tracts of the eastern parts of North Carolina. Another order of carnivorous plants—the Sarracenias, or Side-saddle flowers, the representatives in the New World of the Pitcher plants of the Old—are made to furnish many particulars of curious interest, as are also the minor carnivora which manifest the like propensities in a modified form. Among these are the Butterwort (*Pinguicula lusitanica*), the Bladderwort (*Utricularia vulgaris*), with its associated species very widely diffused, the list closing with the Christmas rose (*Helleborus niger*), in which indications have been

\* *Freaks and Marvels of Plant Life; or, Curiosities of Vegetation.* By M. C. Cooke, M.A., LL.D. Author of "Ponds and Ditches," "The Woodlands," &c. London: Society for Promoting Christian Knowledge. New York: Young & Co. 1881.

detected, if not of persistent fly-catching, yet at least of a capacity for assimilating animal food. A note from Gerard's *Herbal* (p. 157) is appended, in which the quaint old naturalist speaks of the leaves of the Viscaria as covered with a thick and clammy matter like birdlime, so that "if flies do light upon the same they will be entangled with the limessence that they cannot fly away, inasmuch that in some hot day or other you shall see many flies caught by that means. Whereupon I have called it the Catch Fly, or Limewort."

The gyration or circumnutation of plants, for the first time made the subject of regular and systematic investigation by Mr. Darwin, is here set before the reader without the mass of technical detail which was needed to establish upon a scientific basis this important and far-reaching principle in nature. From the clear outlines of the phenomena given by Dr. Cooke, and the illustrations he supplies of the organic movements to be observed in plants of various kinds, the student may do much to carry on for himself the inquiry into the working of this curious property of plant life. The mysterious attraction towards the light, shown in the creeping of buried radicles in the direction of any cranny or crevice where a ray of the sun may pierce; the following of the sun's disc in its course by the heliotropes, or sun-flowers, which has given to this remarkable order the title of polar or compass plant, and made it familiar to travellers as a guide across the prairies unerring as the magnet, may be noticed and appreciated in a minor degree by any one who will watch carefully the behaviour of plants growing on a bank lit and warmed by the sun's bonus. At the same time, he may be impressed with the opposite phenomenon of negative heliotropism, or turning from the sun, observed by Mr. Darwin in *Bignonia capreolata*, an exotic trumpet-flower, and in the *Cyclamen*. The sleep of plants, as determined or influenced by the deprivation of light, furnishes another chapter of inexhaustible interest in botanical study; as do also such freaks of nature as those of the "twiners and climbers" which wreath themselves into tangled masses in the forest or along the hedge-row, or with their tiny hooks creep in fantastic twirls or puzzling zigzags over wall or cottage-roof. The travellers' joy (*Olema vitalba*), the common fumitory (*Fumaria officinalis*), the climbing corydalis (*Corydalis claviculata*), and the Virginia creeper (*Ampelopsis hederacea*), come home to every observer of nature; whilst for exotic specimens he may turn to what our author has to tell him of the Michigan rose, or his striking picture of the Natal climbing plant (*Oeropogon Sandersoni*, fig. 22). The dispersion of plants, their abnormal, dwarf, or giant growths, and their strange and perplexing mimicry of other forms of life, animal as well as vegetable—in which part of his book the writer is betrayed into a weak hankering after the doctrine of design in its pre-Darwinian stage—are treated of with much variety of illustration. Without pretending to high scientific quality, the work throughout is well fitted to instruct and to attract a class of readers who might shrink from grappling with a scientific text-book.

#### ARCHIBALD'S COUNTRY SOLICITOR'S PRACTICE.\*

IT was once a popular belief that the new régime instituted eight years ago by the Judicature Act of 1873 was destined to effect an immense simplification in our legal procedure. If any person exists so deluded as to cherish the idea that this result has been or is likely to be attained, we would simply refer him to Mr. Archibald's bulky volume as an evidence of the enormous mass of subsequent acts, orders, rules, forms, and decisions which have conglomerated round the original nucleus, making confusion worse confounded. For really chaos is a mild term to apply to the present condition of legal practice. Complications have arisen with regard to the fundamental measure. In seeking to remedy these, others and worse ones have been introduced; decisions on one provision tend to nullify another, pleadings which were to be so sweetly simple have developed a higher technicality than ever, until competent judges are driven to recommend their total abolition, and Mr. Archibald's is merely the last of a long series of books of practice designed to evolve order out of the hopeless confusion. Of these it is unquestionably one of the best and completest. Treating the country solicitor as a guileless and unlearned legal infant, Mr. Archibald leads him gently on through all the mazes of a modern action at law, adapting the knotty points and hard sayings to his tender understanding, until the professional mind trembles at the prospect of innumerable country solicitors arming themselves with copies of this work, and declaring their independence of counsel for all time to come. Loyalty to the brotherhood of which he is a distinguished member leads Mr. Archibald, however, to deprecate this misuse of his valuable work, and to point out, as he does at p. 144, the dangers a solicitor may run in rashly dispensing with the services of counsel in drawing pleadings, for instance. So that, while solicitors will beyond doubt profit largely by Mr. Archibald's labours, we may hope those labours may not result in the absolute ruin of the much-enduring junior bar.

Speaking seriously, the author is to be very much complimented on this most careful and comprehensive manual. It can only be his modesty which prompts him to commend it primarily to

solicitors, inasmuch as there are few barristers who would not be the wiser for studying it. A particularly valuable feature consists in the numerous suggestions it contains as to various questions arising every day on which no reported authority is available—suggestions which, from Mr. Archibald's position and peculiar facilities, we can well believe are in many cases "inspired." Thus, at p. 163, speaking of the practice which has grown up of a defendant denying his liability altogether, and at the same time paying money into court in satisfaction of the claim he disputes, Mr. Archibald says:—"There is no provision on the subject; but it is presumed the court has power to order the money to be repaid if the plaintiff has taken it out of court and ultimately fails in his action"—a useful hint, inasmuch as the popular belief has hitherto been to the contrary. So, again, at p. 1108, in the addenda by which Mr. Archibald brings his work up to the level of the very latest decisions, he suggests a method by which money paid into court as a condition of being permitted to defend may be tendered and pleaded in satisfaction—another doubtful point, on which there is as yet no authority. In the more beaten tracks of procedure the work is no less efficient. It embodies the whole system now in force, artistically supplementing the new practice by the still existing remnants of the old, so as to be absolutely complete in itself, and to enable its fortunate possessor to dispose of his "Ohitty's Archibald," his "Lush's Practice," his "Wilson's Judicature Acts," and all other like manuals for what they will fetch. From which sweeping supersession we would, however, except another work of the same author—namely, "Forms of Summons and Orders," the leading authority on a subject which could not well have been incorporated into the present volume, and which forms a fitting pendant thereto.

Almost the only point in which we could wish Mr. Archibald's book to be other than it is, is as to the collection of forms of pleadings which he has adopted from the schedule to the Judicature Acts. Of course, these forms have to a certain extent the sanction of authority, and we suppose the author could not well have dispensed with them, but they are really very inferior models; there is among them an extraordinary predominance of precedents for shipping cases, and a corresponding paucity of formulas of more general utility, while some of the specimens are absolutely misleading—notably that of the pleadings in a foreclosure action, which contains at least three paragraphs which would expose the party utilizing them to the danger of having them struck out at Chambers as embarrassing and contrary to the spirit of the Acts and rules. It is really a pity that Mr. Archibald should have had to mar the efficiency of his book by the insertion of these dubious exemplars, which have long ceased to be regarded with any special reverence, and we should have considered him fully justified had he seen fit to reform some of them in accordance with recent decisions.

One of the most hopelessly involved and contradictory departments in the existing procedure is that concerning the employment and functions of the Official Referees. Though these functionaries are, so to speak, the pet offspring of the Judicature Act of 1873, that Act, the rules intended to carry out its provisions, and judicial decisions upon both Act and rules, have combined to put them in an anomalous and almost ridiculous position. The Act and the rules distinctly imply that they may try actions and direct judgment to be entered for the successful party; the judges say they cannot try actions, and cannot direct judgment to be entered. Mr. Archibald, in an excellent and lucid chapter on arbitration, does his very best to guide his reader through the conflicting authorities, though of course it is not within his power to reconcile things which are distinctly and diametrically opposed to one another. Probably either the Act or the rules will have to undergo a complete process of remodelling before the Official Referees can discharge their allotted duties in peace and comfort. Nor does Mr. Archibald confine himself to mere matters of practice. He discourses ably on bills of sale, acknowledgments of married women, and other subjects with which it behoves the country solicitor to be well acquainted. With regard to the former topic, we may mention that the author has, with laudable alacrity and conscientiousness, recalled all unsold copies of his work, with a view to correcting an error which had crept into the report of a bill of sale case at p. 553. This has now been done, and the book is as trustworthy on this point as it is on all others.

At least one half of the book is occupied by the Acts, orders, rules, and forms which constitute the authoritative source and exponents of the existing practice, and which are here printed at full length. This course does not, however, in the present case give rise to the slightest suspicion of any intention on the part of the author to pad out his work to comely proportions, or to economise the product of his own brain by copious extracts from the statute book. A reduction rather than an increase in size is what Mr. Archibald's book could best stand, and in books of practice it is absolutely essential to have at hand the *ipsissima verba* of the enactments and regulations under which proceedings are being conducted. A text-book, however good, is of but little use as authority in such matters; but a text-book which tells you where to find the authority, and at the same time supplies you with it, is obviously the most useful kind of manual. We must confess to some slight misgiving as to whether the very bulk and completeness of Mr. Archibald's book may not somewhat stand in the way of its general adoption by London practitioners. In the hurry and bustle of Judges' Chambers, for instance, it might be difficult at the moment to hit on the particular one of its 1,266

\* *Archibald's Country Solicitor's Practice: a Handbook of the Practice in the Queen's Bench Division of the High Court of Justice.* By W. F. A. Archibald, Esq., Barrister-at-Law. London: Stevens and Sons. 1882.

pages which contained the particular point to which one wished to refer. It is, however, admirably arranged and indexed, with a view, no doubt, to obviating this difficulty as far as possible, and a judicious turning down of pages beforehand would guide the eye of the practitioner to the required point. For the seclusion of the office or chambers it is, however, as we have before intimated, singularly well adapted. The references are wonderfully copious, their selection not being confined to the ordinary reports only, but embracing the *Weekly Notes*, the *Weekly Reporter*, and the *Law Times*, in whose pages so many practice cases lie entombed, and from which, without some such assistance, it is so exceedingly difficult to unearth them. These minor reports are a perpetual source of terror to the practitioner, who can never feel quite sure that they may not contain some obscure authority adverse to his contention, which, unknown to him, may prove a weapon in the hand of his opponent. So far as practice is concerned, Mr. Archibald has now dispelled much of this terror by enabling one to know the worst, or else to enjoy the feeling of safety.

The portentous length of the addenda above referred to proves the author's extreme assiduity and care up to the very moment of his book's going to press, and also shows the need that exists for the continual issue of new books of practice or the thorough revision of old ones. Nothing is more misleading than a superannuated law book; it is of about as much use as a last year's almanack. In these addenda Mr. Archibald has a fair foundation for a second edition of his work, which we trust will ere long be necessitated by the well-deserved exhaustion of the first. In his preface he refers to another cause which might some day have the same effect—namely, the possible adoption in whole or in part of the recent Report of the Chancellor's Committee on Legal Procedure. No signs of any stir in this direction are, however, as yet apparent; possibly the authorities are waiting until they can obtain the requisite co-operation of the Legislature; and, so far as any danger of Mr. Archibald's book being thus superseded is concerned, we are inclined to believe it will share the immunity enjoyed by threatened men.

## CHRISTMAS BOOKS.

11.

WE have not, this week, to review any of the more splendid works of men and publishers. The splendours of the Christmas season are probably still in the hands of the binders; the largest and most sumptuous of the books of the week is an American volume of travel, *The Heart of the White Mountains*, by Mr. S. B. Drake, with illustrations by Mr. Hamilton Gibson (Chatto and Windus). The White Mountain is the Ararat of the Red Indians, or rather, is one of their Ararats; for every race which possesses the tradition of the Deluge points out its own local eminence on which its local Noah landed after the waters abated. The Indians believe the White Mountain to be the abode of no ordinary Manitou, and approach with reluctance the snowy tops of a hill which is not more their Ararat than their Olympus. The Deluge legend in this part of America tells how one Powaw and his wife alone escaped from the flood; how they sought safety on the crest of the White Mountain; and how, as the waters withdrew, the Powaw sent forth, not a dove, like Noah, but a hare to spy out the land. In a recent essay, by the way, on the Deluge-myths, M. Lenormant maintained that the people of Africa have no such tradition. It would be strange if they were really unacquainted with a story so widely spread that it is current in India, in North and South America, among Celts, and Greeks, and Australians. By a curious accident, the author of *Uncle Remus* makes his plantation negro tell the nigger story of the flood, which, in this African myth, was brought about by the machinations of the crayfish. "There wasn't no ark in this yer Deluge," says Uncle Remus, and his artless narrative seems to throw doubt on the statement of M. Lenormant. But it must not be supposed that *The Heart of the White Mountains* is all given up to Red Indian mythology. We read of the great carbuncle of the hills, the fabulous stone commemorated by Hawthorne, and we have countless descriptions and pictures of fresh and attractive scenery, and humorous American anecdotes of travel. The woodcuts are generally executed with delicacy, and the book is not only well got up, but permits itself to be read with pleasure. This is unusual in Christmas books.

*Features of Bird Life in Pen and Pencil* (Rev. M. G. Watkins, M.A. Illustrated by Giacomelli. Cassell, Petter, Galpin, and Co.) These pictures of the life of birds are very pretty and clever. The frontispiece is particularly ingenious; a number of draggled and drenched little birds are cowering away from the storm in the niches of a sculptured stone. The owl, which makes the tailpiece of the preface, is a most knowing and uncanny fowl. Mr. Watkins's letterpress is an interesting combination of natural history, poetry, and folk-lore. The woodcuts are engraved with much delicacy, and the book should be a favourite in all country houses.

For the poems in *Indian Summer* (Griffith and Farran) Mr. Clarkson confesses his debt to "American poets only," while the sketches were made in the woods of Maryland. Among the poets who supply the verse we notice such celebrated writers as Miss Mary Mapes Dodge, Miss Celia Thaxter, Mrs. Piatt, and the names, even better known in Europe, of Longfellow and Lowell and Joaquin Miller. The following verses of Mr. Wilde's strike

us as being almost the gloomiest over which we ever dropped the tear of sensibility:—

My life is like the autumn leaf  
That trembles in the moon's pale ray,  
Its hold is frail, its date is brief,  
Restless and soon to pass away.  
Yet ere that leaf shall fall and fade,  
The parent tree will mourn its shade,  
The winds bewail the leafless tree,  
But none shall breathe a sigh for me!

In a verse of Mr. Lathrop's address to Mr. Longfellow on his seventieth birthday we foresee the conjectural reading of the future German critic:—

And if too soon the hear-frost throngs  
Your air, O Poet of our prime,  
It seeks in vain to chill your songs,  
Or blanch the beauty of your rhyme.

For "air" some commentator is certain, in the by and by, to read "hair." The poems in this volume are more engaging than the rather garish coloured illustrations.

*Dreams, Dances, and Disappointments* (G. Konstans, E. Casella, and N. Casella. De La Rue) is an exceedingly pretty picture-book, in the style of Mr. Caldecott, though graver in tone. We have rarely seen such pleasant reproductions of the ways of the last century.

The pictures of animals in *A Winter Nosegay* (Sonnenschein and Allen) are extremely spirited and lively, and give a not unnecessary interest to the letterpress.

*The Cornet of Horse* is the history, by Mr. Henty (Sampson Low, Marston, and Co.), of a Herculean young officer who served under "George Churchill," as Mr. Henty unakes Marlborough call himself. This is obviously a mere slip of the pen, which Mr. Henty redeems by his careful maps of the battles fought "in Anna's wars." The Cornet of Horse is the best swordsman of his time. The artist, however, depicts him in the act of lunging with his left foot foremost, and his attitude on guard in a duel is elaborately absurd. The hero throws all his weight on his right foot, and only touches the ground with the heel of his left foot. In this position, of course, he would be the helpless victim of his big opponent. His attitude is that of the "Narcissus" in the Naples Museum, or of one of the Inner Brotherhood in *Patience*. This is the artist's affair; but the innumerable adventures of the hero will be the delight of boys, and we confess to having read Mr. Henty's book with the utmost excitement. When the hero was sucked in by the mill-wheel we gave him up for lost; but from this, as from all his other perils, he emerges unharmed.

*Salt Water* (Griffith and Farran) is quite as thrilling an account by Mr. Kingston of danger and battle by sea, and is certainly more interesting than most of the novels in three volumes which make the life of the reviewer hideous.

*Our Little Ones* (same publishers) is a lively American collection of papers for children. We deeply sympathize with the hero of "Johnnie's story." "I wanted to be good. I wanted to have lots of fun." Alas, this is the human tragedy in brief.

*The Home Library—Constantine the Great* (Rev. Edward L. Outts, B.A. S.P.C.K.)—Mr. Outts has spared no pains to make his book attractive and interesting. He has read a great many authorities, ancient and modern (especially the latter), on the early history of the Church, and quotes from them freely. He has also a number of very good drawings scattered through his pages, some of which are copies of coins with the portraits of the Emperors, and others sketches of scenery and public buildings. We value these the more highly, as good drawings in Christmas books are as rare as swallows in winter. Mr. Outts's literary style is not, however, always equal to his matter. He occasionally uses newspaper slang, and condescends to such amazing expressions as "a handsome and cultured Emperor." We must object to a statement he makes on page 2. This is, that "the provinces which are so familiar to us under the names of Bosnia, Herzegovina, Servia, and Dalmatia, were familiar to the world then under their ancient names of Dalmatia, Noricum, Pannonia, Moesia, and Thrace . . . they were then united under the name of Illyricum." Now, at no time was the name "Noricum" applied to either Bosnia or Dalmatia. Noricum was the country south of the Danube and west of Vindobona, or Vienna, comprehending most of the modern provinces of Austria, Styria, Carinthia, and Carniola. Pannonia lay directly east of it, bounded on the east by the Danube, and with only a small portion of its territory included in the modern Bosnia; while Thrace, far from forming any part of the province or prefecture of Illyricum, was reckoned one of the members of the Prefecture of the East.

*The Brave Men of Eyam* (Edw. N. Hoare, M.A. S.P.C.K.)—There is no sadder tragedy in all history than the almost complete depopulation of the Derbyshire village of Eyam during the great Plague of 1665. The pestilence was introduced in a bale of goods sent from London, and in less than a year five-sixths of the inhabitants were dead. Whole families were swept away; women, reduced to misery and want, were forced to dig the graves of their relations; and it was only the courage of the villagers, who remained inside their homes and faced the death that awaited them, which prevented the Plague from spreading widely. Mr. Hoare has told his ghastly story well, neither sickening his readers with unnecessary details, nor giving way to sentimentality; but we think it a pity that he introduced the murder of the pedlar, which seems pointless. Indeed a murder is a thing to pass unheeded in the presence of such horrors.

*Off to the Wilds* (Geo. Manville Fenn. Sampson Low and Co.)—Zulaland has hitherto been saved from the pen of the writers of boys' books; but, now that Rorke's Drift has taken the place of the Balacava Charge in our plays and novels, the well-trodden fields of Canada and the South Sea Islands have been deserted for the attractions of Cape Colony. Adventures, however, are just as numerous and striking as of old. We still have monstrous, maneless, yellow lions crawling along the sedgy grass; and we know that the lion has his part to play in harmlessly exciting us before he is disposed of. Large herds of gnus—creatures resembling bisons—tails in air and heads on the ground, charge the defenceless white boy with all their accustomed (and futile) vigour; while worse than all is our old friend the serpent, "writhing and turning in the most horrible manner down in a narrow rift," equally ready to crush a gazelle or wind itself round the body of a man. These wonders are not, however, left solely to the imagination, but are impressed on our minds by numerous pictures. There is a perfect Zoological Gardens in the book, and some rather curious foreshortening. In p. 164 the men look as if they were gracefully balanced on waving ears of corn. In p. 154 the boy is like a caterpillar; while the rhinoceros (p. 225) seems to bound after the fashion of a dream beast, rather than to crush through the brushwood in the manner characteristic of the real quadruped. But boys will not care about these little shortcomings, and will delight in all the hairbreadth escapes.

*Hoodie* (Mrs. Molesworth. With Illustrations by M. Ellen Edwards. Routledge).—Mrs. Molesworth has given us one more of her stories, which, like the others, is pretty and charming, but yet unsuitable for childish reading. The notion that it is "interesting" to be naughty is one that is by no means unfamiliar to grown-up men and women, and it is surely a mistake to implant it in children's minds. The teaching of the old fairy tales was far more wholesome than this. Cinderella, it is true, had something of the *fille encompas* about her (especially as drawn by Mr. Millais), but, luckily for her, lacked the time to brood over her wrongs. The picture of a little girl of five making herself miserable over the thought that nobody loved her is, we hope, untrue to nature, or, if not untrue, is a fact to be passed sadly by without comment. Besides, children, especially little children, never think in language. They have strong impressions, but these are too vague to be translated into words. If, however, we object to *Hoodie* as a Christmas present for our nephew and niece, we have found much entertainment in it ourselves; and the illustrations are above the average.

*Aunt Judy's Annual Volume for 1881* (Edited by H. F. Gatty. Bell and Sons).—If we cannot have Mrs. Ewing herself to write the leading story in *Aunt Judy's Christmas Number*, the next best thing is to have one by the author of "Castle Blair." Her present small hero does not, however, resemble the Irish boys who were the torment of their relatives. Hector was of French origin, and went for a few months to visit his relations in France. His one thought was "birds," and how to make himself as much a bird as possible. Like all Miss Shaw's children, he is perfectly natural and not self-conscious. The rest of the volume is painstaking, but perhaps hardly up to its usual interest.

*Hide and Seek: a Story of the New Forest in 1647* (Mrs. Frank Cooper. S.P.C.K.).—Life in 1647 must, indeed, have been full of surprises if it was as lively a thing as Mrs. Cooper would have us believe. She has, however, given us a vivid and interesting picture of the kind of adventures to which people were liable at that date, though we would fain hope these perils did not follow quite so fast on each other's heels, and that the unfortunate creatures were allowed a little breathing space to recruit their spirits.

*Our Bob* (Author of the "Lost Note." S.P.C.K.).—The illustrations to this story are the most singular thing about it. There is a picture of "Our Bob" in the act of pulling off his coat before plunging into the water to save a drowning child, which we thought for a long time was a waiter wringing out a napkin. The child is in the water a foot or two off, apparently surveying the prospect at his leisure, while his mother, who has evidently much more repose than is usual in her class, is sitting in a corner with her face in her hands. The story begins well, but the dénouement is improbable.

*Vanda* (Esme Stuart. S.P.C.K.).—By far the best part of *Vanda* is the description of the Mathon family, where the gifted young lady who bestows her name on the book became governess. There is real humour in the sketch of the cheerful captain who loves to tease his matter-of-fact irritable wife, and of their two mischievous little boys. The rest of the book, though pleasant reading enough, has nothing remarkable about it.

*Under Palm and Pine* (J. A. Owen. S.P.C.K.).—This is a bright little tale, laid partly in Tahiti and partly in New Zealand. The story, perhaps, does not come to much; but it contains some adventures and pretty descriptions.

#### FRENCH LITERATURE.

IT is not often that a book has twice to run the gauntlet of legal tribunals; but this is, we believe, the fate of Benjamin Constant's *Letters to Mme. Récamier* (1). Almost immediately after the lady's death they were advertised for publication in the

(1) *Lettres de Benjamin Constant à madame Récamier*. Paris: Calmann-Lévy.

*Presse*, though the joint opposition of the two families, supported by a legal decision, made M. Emile de Girardin abandon the publication. Now, so far as we can make out, Mme. Récamier's representatives have sanctioned their issue, while Benjamin Constant's still protest. It was, indeed, recently announced that a fresh lawsuit was to follow on their issue. It would not be fitting to give any opinion here on the propriety of this course; but, without exceeding the limits of purely literary criticism, the difference of attitude may be said to be comprehensible enough. There is nothing in the strict sense compromising to either party in these letters, which show pretty distinctly how purely platonic, on the lady's side at least, was the *liaison* which led to two duels between Constant and others of her admirers. The only reason that we can imagine for the objection which the representatives of the author of *Adolphe* are said to entertain to their publication is that they destroy, or at any rate alter, one's previous conception of his character. Benjamin Constant has always had the credit of being a kind of elder Henri de Marsay, with English instead of French characteristics—a perfectly cold-hearted and clear-sighted person, to whom the various celebrated women with whom he was connected were merely so many playthings. A perusal of these letters scarcely sustains this view. Constant is nearly as passionate in his attitude towards his Juliette as Mlle. de l'Épinasse is towards her Guibert; and, what is still odder, the references in the letters to Mme. de Staël by no means bear out the current idea of Corinne as the victim, of Benjamin as the sacrificing priest. An appendix, however, which contains some fragments of unpublished memoirs, contains a terrible portrait of Mme. de Staël, not, indeed, very surprising to acute students of that person, but likely considerably to disturb Dr. Stevens, her late enthusiastic biographer. According to Constant, who certainly had reasons for knowing, Corinne must have very much resembled a certain English statesman in petticoats. "Mme. de Staël est de bonne foi successivement en mille sens contraires. Mais comme dans chacun des moments où elle est réellement de bonne foi, on est subjugué par l'accent de vérité qui retentit dans ses paroles . . . son éloquence produit sur elle le même effet que sur ses auditeurs. En se préférant aux autres elle ne pense être que juste et elle s'estime de sa justice."

The fourth volume of M. Gambetta's speeches (2), which has acquired an additional interest in the course of its passage through the press, does not contain any of his most famous utterances. But the articles on the anniversary of Hoche's death (thrice repeated), on Edgar Quinet, and on that curious person, D'Alton Shee, are of some general interest, not to mention others.

An anonymous pamphlet (3) on the Egyptian question takes the line of exaggerating the importance of Turkish intervention, and of urging the value of French "political" interference as contrasted with interference in the mere interest of French subjects. Students of this thorny question will know what to make of this and of the covert insinuations against England; others the brochure will hardly interest.

M. Gambetta's new Under-Secretary for Foreign Affairs can hardly be charged with issuing his book (4) as a testimonial for office, inasmuch as it must have passed through the press some time before the fall of the Ferry Cabinet. It is an eminent example of the style which Mr. Carlyle, in one of the moments when his genius was most with him, baptized for ever as "dull-snuffing." With insignificant changes, it might be the work of a club orator of the First Revolution, a description which M. Spuller will take as a compliment, and which will fully characterize it to those who are acquainted with history. "Dix-huit siècles de civilisation chrétienne (*Rivra*)" is the sort of thing which occurs throughout. It must be admitted that the Republican grouse in the gun-room requires a special education to make it specially laughworthy.

The Duchess de FitzJames has reprinted in pamphlet form (5) her valuable article on American vines and their use in fighting the phylloxera, which, when it first appeared in the *Revue des Deux Mondes*, was fully commented on in the *Saturday Review*.

M. Fernand Maurice's essay (6) is a very clever and a rather dispiriting production. It bears a close resemblance (except that it is better written) to an Oxford prize essay. The author has acquired the knack of taking rapid general views of history, and has seized the idea that at the present moment everything French is to be seen in the light of the Republic. So he starts the question whether there must not of necessity be something radically different between a Monarchical and a Republican foreign policy. The latter seems, as far as we can make it out, to be to let everything go by the board. How little M. Maurice guards his easy historical *aperçus* by any acquaintance with actual facts may best be judged by his argument that English foreign policy is always the same, and that public opinion in England would scout alterations in it. What M. Maurice needs is a caution to read the newspapers as well as the philosophical historians, and to remember that there is such a thing as human nature.

M. Gabriel Monod is well known to students of contemporary French literature, and it is hardly necessary to say that anything

(2) *Discours et plaidoyers politiques de M. Gambetta*. Tome IV. Paris: Charpentier.

(3) *La question égyptienne*. Paris: Leroux.

(4) *Nouvelles conférences populaires*. Par E. Spuller. Paris: Charpentier.

(5) *Grande culture de la vigne américaine en France*. Par Mme. la duchesse de FitzJames. Nîmes: Dubois.

(6) *La politique extérieure de la république française*. Par E. Maurice. Paris: Germer-Baillière.

which he does or superintends will be more or less well done. His present enterprise (7), however, does not commend itself to us. It seems that something or somebody answering to our "My Lords" has decreed that the *neuvèmes* in French schools (that is, the lowest class) should have Greek and Roman history, together with that of non-classical antiquity and a few specimen biographies of classical worthies, hashed up for them in an exceedingly exiguous primer. The thing is here very cleverly done, or rather would be done if it were not impossible.

It is rather a pity that such a book as M. Borel d'Hauterive's *Sieges de Paris* (8) should have reached a third edition. What can be thought of a professedly sober writer who inserts a stupid *chanson* of his own about "Le barbare Attila" and "A Berlin" and "Le Rhin français" and "Le jour prochain de la revanche," and who, in recounting the entry of the Prussians into Paris, has the incredible silliness to talk about "un cordon *infranchissable* formé par les gardes nationaux pour empêcher les Allemands de pénétrer dans la ville," and to say that "pour satisfaire leur amour propre il avait fallu les laisser se glisser un instant"? After "la revanche" it may be pardonable to talk in this way.

A very pretty little book (9) in M. Leroux's pretty little series of folk lore contains some translations of Albanian tales, many of which are curiously Oriental in character. M. Dozon seems to be at present in Cyprus, and to be studying Cypriot traditions.

M. Xavier Marmier is not exactly one of the chief glories of the French Academy, and his American travels (10) are considerably behind the time. But they are written on the accepted lines of travel in France, which lines may be said to be, first, the observation of a perpetual forced liveliness, and, secondly, the inculcation of the superiority of France and Frenchmen to all other countries and nations. It is, therefore, not very wonderful that they should have reached a new edition.

It is possible that some very hard-hearted person might question the right of M. Paul de Musset to have his works presented in so dainty a form (11) as that of M. Lemerre's *Petite bibliothèque*. But it is a great thing to have a brother, and (let it be freely confessed) a greater thing to believe frankly in him, and to take up the cudgels for him gallantly against all comers. M. Paul de Musset's merits in this kind incline us not to press too hardly the comparison between his *Originaux* and Gautier's *Grotesques*.

M. Emile Zola, or some too zealous friend for him, makes such constant and skillful use of *la réclame*—in plain English, of puffery—that even non-subscribers to the *St. Petersburg Messenger de l'Europe* are pretty well acquainted with his critical lucubrations long before they are collected in volumes. This present book (12) illustrates perhaps better than any of its forerunners the strength and the weakness of M. Zola in criticism, for it would be absurd to pretend that there is not strength as well as weakness. M. Zola has unfortunately had a very insufficient literary education; he has fallen early among those worst of thieves, the members of a small mutual admiration society, and he has subjugated himself hopelessly to the most terrible of all slaveries, the slavery of jargon. The consequence is that perhaps no other living writer writes such a curious mixture of sense and nonsense. When M. Zola is talking about the achievements of naturalist literature, the scientific movement, and so forth, he always talks nonsense without exception, and when he attacks his personal enemies he is always unimportant though often amusing. But when he happens to get upon neutral ground his natural shrewdness, which is great, constantly emerges. He knows absolutely nothing about poetry, and therefore no one who has not much time to spare need trouble himself to open his articles on Victor Hugo, on Gautier, on Musset as a poet—for there are some shrewd remarks on Musset as a man—or on contemporary poetry in France. The writer is simply not at the point of view, and his observations are therefore irrelevant. But on Chateaubriand, and in the long and interesting paper on Sainte-Beuve, he has much to say that is worth attention, though neither article is to be recommended to any one who is not in a position to apply the corrective of independent knowledge and criticism. Then we have "La critique contemporaine," which is merely a personal repartee on the critics who do not like M. Zola. How empty his dicta are in such a case may be estimated from his impertinent remarks on M. Oberbuliez, who certainly has his faults as a novelist, but whose best works are worth all M. Zola's put together, and on M. Emile Montégut, one single page of whose best criticism is sufficient to outweigh everything that M. Zola has written in that way. The book ends with an essay on "La moralité dans la littérature," which is an earnest attempt to distinguish between "Brantôme, Boccaccio, and La Fontaine," on the one hand, and *Nana* on the other. The attempt really was not needed.

Many people are more or less interested in French North Africa just now, and all who are so interested will find M. Choisy's book (13) worth their attention. At the time when the late ill-

fated Colonel Flatters set out on his expedition to explore the route for an Algiers-Timbuctoo railway, M. Choisy, who is a civil engineer by profession, was charged with the humbler duty of exploring the triangle between Laghouat, Goleah, and Wargla—a district nominally included within the limits of Algeria, but entirely Saharan in character, and exposed to the incursions of semi-independent tribes. No actual harm came to the little party of surveyors, though they had many frights. But the utterly impracticable nature of the country, the impossibility of its being turned to any account by civilized inhabitants, and the extreme difficulty of prosecuting military operations in it appear very well in these pages. It is not superfluous to remind the reader that the country here described is typical of the entire region from the Nile Valley to the Atlantic.

M. Bougot's is a handsome book (14), and one of no inconsiderable value as a contribution to archaeology. Everybody who has something more than a conventional knowledge of Greek literature knows the peculiar luxuriance and minuteness of the later Greek descriptions of "pictures." In the Greek romances especially they form a staple element, but the most considerable collection of them is that of the rhetorician Philostratus, who is best known as the author of the *Life of Apollonius of Tyana*. These descriptions M. Bougot has translated with an ample commentary and with illustrations of the subjects wherever possible, these illustrations being derived from modern as well as from ancient art, but principally from the latter. The only fault that we have to find with the book is the miscellaneous character of the illustrations, which would seem to have been taken from other works. Here we have a lithograph, here a woodcut, here a héliogravure—a mixture not worthy of so handsome a volume.

In the *Revue des arts décoratifs* for September (15) there is an article on Pugot which is worth reading, and in that for October some "Reminiscences of a Director of the Fine Arts," by M. de Chennevières. Both numbers contain among the illustrations some fine examples of Venetian glass from the Limoges Museum.

Among an unusual number of novels Mme. Henry Gréville's *Perdue* (16) fairly takes first place. It is a very pleasant sketch of the fortunes of a lost child, somewhat slight, but with details in the author's best manner, while it is at the same time entirely suited for anybody's reading, even for the famous young persons "dout on coupe le pain en tartines." *Sauvageonne*, by A. Theuriot (17), does not deserve this latter description. It is, however, a story of greater power than is usual with its author, while its descriptions of forest scenery are both skilful and attractive. The chief fault of the book is the faint and indefinable but perceptible appearance of that discipleship to George Sand and M. Octave Feuillet of which M. Emile Zola has rudely but not unjustly accused the author of *Sauvageonne*. The situation of the wife, her husband, and her adopted step-daughter is wholly different from that of *Julia de Trécar* no doubt, yet a kind of feeling obstinately recurs that if *Julia de Trécar* had not been written neither would *Sauvageonne* have been. Still the book has interest, though of no very agreeable kind. MM. Catulle Mendès and Richard Leclède are two practised men of letters, and the former at least is no mean writer. They might perhaps have been better inspired than in their fancy sketches (18) from the life of Capigliostro. General Ambert's book (19), which we class with novels chiefly because it is not easy to know where else to place it, is a collection of tales, short essays, and miscellaneous papers tinged with a strongly clerical spirit. The writer, we fear, has too little sense of humour and too weak a pen to do his allies much service. In *La buccasse de perles* (20) M. Mario Uchard has apparently determined to slaughter the naturalists with their own weapons. Although, however, he has imitated their audacity in selection and treatment of subjects, as well as sometimes at least their photographic minuteness, he has not caught the true "scientific" drone, and is deficient in the necessary *argot*. Nor, on the other hand, has he the romantic charm; so that his poor modern Cleopatra is tragical without being really affecting. The chief merit of *Trop sèvre* (21) is its Wilkie-Collins-like setting, describing the meeting of a famous doctor and a casual passenger in a train, and the reception of both of them in a great old house at Lille. The tale which this book contains may or may not interest the reader. *Un cas de folie* (22) is a romance of crime of a rather complicated character. It is well written, and, like *La mort d'Eva*, gives the idea that its author has a future before him in novel-writing of the kind of which M. Louis Ulbach has been hitherto the chief practitioner in France. He has, however, as it seems to us, in this instance scarcely taken space enough for the development of his plot and characters. M. Guy de Charnacé has written in *Une parvenue* (23) a decidedly commonplace book concerning *nouveaux riches*, marriages for money, illicit connexions, &c. Although criticism by comparison is often not very fair, it is not, we

think, unfair to describe M. Rémusat's book (24) as being not unlike Captain Mayne Reid in his more ambitious moods. The Frenchman, as might be expected, is the better novelist and the better writer of the two. The sub-title of his book, "Souvenirs d'un marin à la Havane," describes it pretty well. M. Daniel Bernard has written a story about brigands (25) which has considerable merit. The woes of the luckless banker who is captured and made executioner to the band, and brother-in-law of the chief to wit, are depicted with a good deal of ingenuity, and show not a little skill in avoiding the burlesque while keeping up an undercurrent of comedy. Very little can be said for M. Armand Silvestre (26), who, as in *Les farces de l'ami Jacques*, is coarse without being graphic, and jocular without being amusing. Our list closes with three family books, all of which have merit. M. J. Girardin (27) is nearly always to be trusted, not merely in the moral, but in the literary sense, though he sometimes spins his stories out rather further than their substance will bear.

For intending Land Owners and Occupiers, Land Agents, Surveyors, Colonists, &c. The COLLEGE FARM, for the practical instruction of the Students, surrounds the College, and is a mixed Farm of about 800 Acres.

Resident—His Grace the Duke of MARLBOROUGH, K.G.

Committee of Management.

The Right Hon. the Earl of DUNELM, Chairman.

The Right Hon. the Earl of BATHURST.

The Right Hon. Sir MICHAEL E. HICKS-BEACH, Bart., M.P.

Lieut.-Col. R. NIGEL F. KINGSFOTE, O.B., M.P.

GEORGE T. J. NOTHERTON-ENTCOURT, Esq., M.P.

AMBROSE L. GODDARD, Esq.

EDWARD ROWLY, Esq.

WILLIAM JOHN EDMONDS, Esq.

Major T. W. CHESTER MASTER, M.P.

For Prospectus of COLLEGE and FARM, List of Scholarships, Prizes, Diplomas, &c., apply to the PRINCIPAL.

NEXT SESSION begins January 31.

**BRIGHTON COLLEGE.** Principal—Rev. T. HAYES BELCHER, M.A., Queen's College, Oxford.

Vice-Principal—Rev. J. NEWTON, M.A., St. John's College, Cambridge.

A special Army Class in which preparation is made for Sandhurst, Woolwich, Cooper's Hill, and Indian Civil Service, has been in active work for some time. The course of instruction enables boys to go up for their examination direct from the College. The NEXT TERM will commence on Friday, January 27.

F. W. MADDEN, M.B.A.S., Secretary.

**MALVERN COLLEGE.** The NEXT TERM commences on Friday, January 27. Entrance Examinations on January 30. For particulars apply to HENRY ALDRICH, Esq., Secretary.

**SOMERSETSHIRE COLLEGE, BATH.**—The College is divided into Classical and Modern sides. BOARDERS are taken in the Senior Department by the Head-Master; in the Junior Department by the Rev. Philip Carey, M.A. Special attention is given to Dialectic or Backward Boys. For Prospectus, List of Honours, &c., apply to the Head-Master, T. M. BARNLEY, M.A.

**ST. ANDREW'S COLLEGE, CHARDSTOCK, Dorset.** Terms moderate and inclusive. NEXT TERM begins January 27, 1882. Apply to School SECRETARY.

**TRINITY COLLEGE SCHOOL, STRATFORD-ON-AVON.**

Founded by the Rev. J. D. COLLIS, D.D., The Warden, RICHARD F. CURRY, M.A., is assisted by Seven Resident Masters. Classical and Modern sides. Preparation for the University, and all competitive examinations. Special Classes for the Army Examination. Great attention paid to Modern Languages. Junior Department for Young Boys. Large Playing Fields, Gymnasium, Five Courts, &c. &c. Terms 5s and 10s. Scholarships per annum. Apply to the WARDEN.

**A BINGDON SCHOOL, BERKS.**—An Old Foundation, six

miles from Oxford, with New Buildings on gravel soil, in large playing fields, and every requisite for health, study, and domestic comfort. Thorough education given at moderate cost to the BONS of GENTLEMEN. Young Boys carefully prepared for the larger Public Schools. Valuable University Scholarships attached to the School. Apply to the Rev. H. SUMMERS, Head-Master.

**OAKHAM.**—Archdeacon JOHNSON'S SCHOOL,

Head-Master—Rev. E. V. HODGE, M.A., Balliol College, Oxford.

Boys are eligible to Four Leaving Exhibitions of 250 per annum from the School; Sixteen Johnson Exhibitions at Cambridge; Three or more School Exhibitions from 250 to 250; Three Places of 400. New Class-rooms have lately been built, and a new House opened last Term. NEXT TERM begins January 1st.

**WHARFE-DALE SCHOOL, near BEN-RHYDDING, Leeds.**

A PUBLIC SCHOOL for BONS of GENTLEMEN. Preparation for Scholarship and other examinations. Modern Languages. Natural Science. Splendid site. References to School, University Church Dignitaries, &c.—Apply to Rev. T. GRANGE HURR, M.A., Sedburgh School, Yorkshire.

**FOLKESTONE.**—Mr. W. J. JEAFFRESON, M.A. Okon,

assisted by a Cambridge M.A. and competent Teachers, prepare PUPILS for the University, Woolwich, Sandhurst, and all Competitive examinations. A few Vacancies.

**AMESBURY HOUSE, PAGE HEATH, BLOKLEY, Kent.**

Rev. EDMUND FOWLE receives THIRTY-THREE BOYS under the age of Fifteen, to prepare for the Public Schools.

The house, surrounded by six acres of land, is situated in a charming locality, thirteen miles from London.

There is every requirement for a high-class Private School, a cricket and football ground, large iron play-room, forming gymnasium, &c., two Eton five-courts, workshop, dry playground, and a run of a third of a mile on a dry gravel path.

Every Educational advantage given, and many comforts offered, the greatest care being taken of little Boys on their first leaving home.

Great success has been met with, several Open Scholarships gained, and in no single case has a Boy failed to take his place at a public school.

Rev. EDMUND FOWLE is the author of a very successful series of Latin and Greek School Books, one of which was written by special request, for use at Eton, and has been adopted also at Harrow, Merchant Taylors, &c.

**THEOLOGICAL, UNIVERSITY, MILITARY, CIVIL**

SERVICE, and other EXAMINATIONS.—PUPILS rapidly and successfully prepared. Terms moderate. Highest references.—Address, Rev. W. BOWLANDSON, Great Braxted, Witham.

**BOYS from Public Schools and others RECEIVED for the**

CHRISTMAS VACATION by the HEAD-MASTER of CHARDSTOCK COLLEGE, Dorset.—Particulars on application.

**TO PARENTS and GUARDIANS.—WANTED, by a LADY**

of great experience, wife of a medical man, residing in one of the most healthy suburbs of London, the sole CHARGE and EDUCATION of One or Two CHILDREN (Boys not objected to). Every home comfort. The highest references can be given. Terms liberal. For particulars apply to "Medicus," 11, Chandler, Esq., 66 Bishopsgate Street Within, E.C.

**GOVERNESS (January 30).—EX-RECTOR'S DAUGHTER.**

Trilingual, Musician, Vocalist; Certified abroad. Good references. Good salary.—Address, M. F. G., Messrs. Masters, 78 New Bond Street.

**AS SECRETARY.—A GENTLEMAN, educated at Rugby**

and Cambridge, and who speaks and writes French well, seeks an APPOINTMENT in London as SECRETARY to a Gentleman of position. The highest references given and required.—Apply, by letter, W. O., care of Gilbert Robins, Solicitor, 11 Pancras Lane, E.C.

**A RESPECTABLE, middle-aged MAN would be glad of**

EMPLOYMENT of any kind; is a fair scholar, and has held appointments of great responsibility. First-class recommendations. Moderate remuneration.—Address, J. G., 2 Granby Street, Hampstead Road, N.W.

**A U T O G R A P H S!**

Messrs. J. & W. BANTING, who brought this fine Collection before the public last year (although having received many offers from abroad as well as at home, but not having as yet had an acceptable one), again beg to SOLICIT INSPECTION. It will be remembered that, included in the said Collection, are Engraved Portraits, Letters, &c. of and by most Eminent Persons, Ancient and Modern, amongst others those of Kings Henry VII. and VIII., Edward VI., Queen Elizabeth, Charles I. and II., Kings James I. and II., Prince Rupert, Oliver Cromwell, William and Mary, Queen Anne, Kings George I., II., III., and IV., Queen Charlotte, Princess Charlotte, William IV. and Queen Adelaide, Her Majesty Queen Victoria, Prince Albert, &c.; the Dukes of Buckingham and Marlborough, Earl of Rochester, Archbishop Cranmer, most of the celebrated Bishops and Judges, Noblemen, Gentlemen, Statesmen, Artists Poets, &c. (some Thousands in all), many of them being most carefully and beautifully mounted with a Manuscript Description, &c.

N.B.—As before stated, the collection, made during a long life by a private gentleman, is very valuable, and it is very doubtful if such another exists in the world.

They can be inspected at 35 and 37 St. James's Street, between the hours of 10 and 4, on any days excepting Saturdays.

**NEXT PRESENTATION.—For SALE, the next PRE-**

SENTATION to a valuable RECTORY, with very superior House and Grounds, Vineries, and Gardens, charmingly situated, in the County of Suffolk, within a mile of First-class Station and Market Town, and easy drive of the Sea. Population, about 1,000. Good Parish Endowments. Income, about £1,000, chiefly from Rent Charge.—Apply to Mr. R. H. REEVE, Solicitor, Lowestoft, or Messrs. FRICK & SON, Land Agents, Birmingham, Suffolk.

**INVESTMENT in PUBLIC-HOUSE PROPERTY.**

INVESTMENT may be made in Sums and Multiples of £100 up to £1,000 in purchase of Joint Ownership, anonymous if desired.—In PUBLIC-HOUSE PROPERTY, the yield reliable interest of 30 per cent. from thoroughly tried business, the property to be sold upon application, personal or with reference, before December 7, to Messrs. W. ALLEN, JAMES & TAYLOR, 22 Chancery Lane, W.C.

**PENINSULAR and ORIENTAL STEAM NAVIGATION**

COMPANY.

UNDER CONTRACT FOR HER MAJESTY'S MAILS TO INDIA, CHINA, and AUSTRALIA.

**REDUCED RATES OF PASSAGE MONEY.—SPECIAL RETURN TICKETS.**

Departures for—  
BOMBAY, Calcutta, Madras, Ceylon, Weekly, From Gravesend.  
CALCUTTA, MADRAS, CEYLON, Fortnightly, From Gravesend.  
CHINA, STRAITS, JAPAN, Weekly, From Gravesend.  
ADELPHI, MELBOURNE, SYDNEY, Monday.  
GIBRALTAR, MALTA, EGYPT, ADEN, Weekly, by tank of the  
LONDON OFFICES: 112 LEADENHALL STREET, E.C., and 25 COCKSPUR STREET.

**BRIGHTON.—BEDFORD HOTEL.**—Facing Sea and

Regent's Road. Near the West Pier. Central and quiet. Large comfortable suites of Rooms. Special Office-room for Ladies and Gentlemen. See Waterbury's Hotel.

WATERBURY, Manager.

THE PRESIDENT'S MESSAGE.

THE PRESIDENT'S Message to Congress was not likely in present circumstances to be an important document. If President GARFIELD had lived he would have expressed nearly the same meaning in slightly different language. It had been foreseen that the present Government would sustain in reference to the Panama Canal the pretensions of Mr. BLAINE, who indeed is still Secretary of State. Since the issue of Mr. BLAINE's Circular Despatch, his Government seems to have been reminded that the CLAYTON-BULWER Treaty, in which the principle of a joint guarantee was distinctly recognized, is dated four years later than the Columbian Treaty, which, if it had stood alone, could not have affected the rights of third parties. The PRESIDENT now states that negotiations have been instituted for the repeal of the clauses in the CLAYTON-BULWER Treaty which conflict with the recent American claim. In a formal communication to Congress he could not conveniently explain the grounds on which he asks for a concession on the part of England which would introduce an unnecessary innovation into international law. There is no reason, except the assumed supremacy of the United States over the whole American continent, for the exclusion of European Powers from a share in the Panama guarantee. The territories of the Union are separated by hundreds of miles on both coasts from the Isthmus which is to be pierced; and it must be remembered that England also has vast dominions on the shores of the Atlantic and Pacific and in the Gulf of Mexico. The exclusive guarantee looks too much like a claim to keep the key of a passage which will become one of the most important communications in the world. The exclusive and narrow commercial policy of the United States suggests a suspicion that an exclusive control over the Canal might be used for the purpose of imposing differential duties. It seems that the Columbian Government has not hitherto assented to the American proposals; but the PRESIDENT adds that the Columbians will be disposed to enter into fresh negotiations.

In all other respects the external relations of the United States furnish the PRESIDENT with grounds for undisturbed complacency. The friendship between America and France has been cemented by the centenary celebration of their common victory, to which Germany contributed by the visit of the descendants of a soldier of fortune who served in the revolutionary war. The present Government of Germany has complied with the requisitions of the American Government in the matter of emigrants who have acquired rights of citizenship. The friendship between the United States and the Russian Empire is undisturbed, though friendly remonstrances against the persecution of American Jews have still not produced the desired effect. The general harmony of nations includes even England, in consequence of a recent exchange of courteous offices. The sympathy which was felt and expressed during the illness of Mr. GARFIELD seems really to have been appreciated by the American people, and the PRESIDENT deserves personal credit for the good taste and good feeling of the compliment which he paid to England at the close of the Yorktown celebration. The Americans cannot perhaps be held responsible for the meetings of Land Leaguers and Fenians, or for the felonious plots which are announced against English life and property; but it is to be regretted that the model

State of the Union was represented at a Land League meeting by the Governor of Massachusetts, and the model city by the Mayor of Boston. It is natural that the tone of the Presidential Message should be cheerful, as far as it deals with the exemption of the Republic from foreign complications. The despatch of special missions to compose the quarrel between Peru and Chili scarcely forms an exception to the general tranquillity. Abroad, as well as at home, the United States enjoy the proverbial felicity of countries without a history. The advantage which has generally belonged to insignificant States is now shared by the richest and perhaps the most powerful of civilized communities. The domestic portions of the PRESIDENT'S Message sound like common forms. The questions which really interest American politicians are not suited to a formal and conventional statement.

In the United States politics have, except on extraordinary occasions, become a game of which the object is to produce artificial excitement, or they resolve themselves into personal intrigues. The issues which are raised are so insignificant as to be indiscernible to foreigners, though they provide occasion for much apparent activity. The anxiety with which the PRESIDENT'S Message is said to have been awaited was caused only by the doubt whether he would continue General GARFIELD'S policy, which consisted in alliance with Mr. BLAINE against Mr. CONKLING, Mr. CAMERON, and General GRANT. It is not known that any of the rival candidates for power differ from one another in opinion; though several of them possess considerable energy and ability. Mr. CONKLING, like other American politicians, is an opponent of Free-trade. Mr. BLAINE attended the late Tariff Convention for the purpose of approving the project of imposing duties, not for purposes of revenue, but as a protection to domestic industry. The distinction between Republicans and Democrats is scarcely more perceptible than the line which divides the Republican factions. All parties find that the manufacturers are better worth courting than the consumers, who, indeed, for the most part offer no opposition to the fiscal system which is maintained at their expense. No domestic question of importance is likely to be raised in the present Congress, and all American politicians are of the same mind in respect of foreign affairs. Whether Mr. BLAINE succeeds Mr. FAYETTE, or is succeeded by Mr. FREYLINGHUYSEN, the duties of the Secretary of State for the time being will be full of magniloquent patriotism. That a great and free country should continue to thrive in the absence of vigorous politics is an addition to historical experience.

It is perhaps convenient that no considerable legislation should be proposed, inasmuch as the balance of parties would render it difficult or impossible to pass any contested measure. If the internal Republican divisions are left for the time out of consideration, the respective numbers of the Republicans and of the Democrats in the Senate are almost equal. Mr. DAVIS calls himself an Independent, and General MAHONE was nominally elected as a Democrat, but really by a coalition of the Republicans of Virginia with the advocates of State repudiation. He may now be considered as a Republican proselyte; and there is no counterbalancing secession from the party which he has deserted. His alliance, which gives a majority to the Republicans, is not the less eagerly welcomed because he represents the doctrine and practice of fiscal bad faith. If the former adherents of General GARFIELD hesitate to confirm the

nominations of his successor, the Democratic Senators will be able to control official appointments. In the House the Republicans have proved their superiority by appointing a Speaker, but a majority of four will not enable them to pass any Bill which may be distasteful to their adversaries. It is also probable that the feud between Mr. BLAINE and the so-called "Stalwarts" will weaken the Republicans. General GRANT is supposed to be engaged in constant intrigues against the action of the party which returned Mr. GARFIELD. Manchvros in Congress are for the most part designed, not to affect legislation, but to exercise an influence on the next Presidential election. If less than three years the perpetual struggle will recommence, and perhaps by that time the popular objection to a third term of office may have subsided. The PRESIDENT, as might be expected, uses vague and indefinite language in speaking of the question which is of all others most interesting to the CONGRESS, the GRANTS, and the BLAINEs. He is in favour of Civil Service Reform, and he even approves theoretically of the English system of competition; but he thinks that it cannot be prematurely introduced into the United States. In his opinion public appointments should be distributed on the same principles which are adopted by private employers. As no trader and no commercial firm selects clerks or agents by examination, it follows that Mr. ARTHUR has no intention of resorting to competition. If a President, or a Minister were to regard the interests of the State as exclusively as a private person considers his own interests, it may be admitted that examinations would be useless. Mr. BLAINE made some progress in the establishment of a purer system, but it will be a difficult task to eradicate the fundamental American institution. If there are no places to bestow in return for party service, there will be no levy of taxes on salaries, and there will be scarcely any reason for the continuance of electoral organization. In time, perhaps, public opinion will prevail against the efforts of professional politicians.

#### GERMANY AND EUROPE.

COUNT KOLNACKY, the successor of Baron HAYMERLE, has arrived at Berlin, after having paid a visit to St. Petersburg. Before taking possession of the Austrian Foreign Office he wishes to know as accurately as possible the views of the Czar and of Prince BISMARCK. Austria is on the most friendly terms with Germany, and Russia has lately taken much pains to make its relations with Germany as friendly and confidential as possible. Nor is this all. The SULTAN has lately sent a special emissary to Berlin, nominally to offer the EMPEROR the highest order which Turkey has to bestow, and really to assure Prince BISMARCK of the SULTAN's absolute devotion to him, and to ask him to become more and more the supreme guardian of Turkey. Thus it may be said that, for the present, Prince BISMARCK is the master of Eastern Europe and the grand arbiter of the eternal Eastern question in the phase through which it is now passing. It is he to whom the disputants refer, and it is his voice that decides when a decision has to be made. It was Prince BISMARCK who ordered that concession should be made to Greece, and it is Prince BISMARCK who now composes or encourages, as he pleases, the differences of disputants, in the minor quarrels which inevitably arise from day to day. Austria, for example, has introduced the conscription into Bosnia and Herzegovina, and the SULTAN naturally objects. Theoretically the SULTAN has much to say for himself. The Bosnians and Herzegovinians are his subjects, not the subjects of the Emperor of AUSTRIA, who is merely occupying two Turkish provinces; and it seems strange that the subjects of the SULTAN should be enrolled against their will in a foreign army, which may any day be ordered to occupy fresh portions of the SULTAN's territory. But Austria has two reasons for enforcing the conscription. As the Bosnians would certainly not be permitted to be enrolled in the Turkish army, they would, if not subjected to the Austrian conscription, escape conscription altogether; and there is in the eyes of every Continental Power something unnatural, and almost horrible, in any body of men having the luck through a pure accident to escape conscription. The other portion, too, of the Austrian Empire, would regard it as very unfair on them that, after they have spent much money and many lives in taking possession of Bosnia and Herzegovina, those whom they have benefited should

escape repayment, and should be allowed to avoid furnishing their due contingent both of money and of men. Further Austria regards the opposition to the annexation in its semi-Turkish provinces as a challenge to show that it has the courage to treat Slavs as it would treat any other people. The Slav world, with Russia at its head, has conceived the notion that Austria, if it takes on itself the protection of any Slav race, is bound to treat those whom it protects as a sacred and peculiar people. Austria—that is, German Austria and Hungary—accepts the challenge, and enforces the conscription. There is every sign that Prince BISMARCK here supports Austria. The SULTAN complains, and no one attends to him, and Russia is silent and acquiescent while Slavs are conscribed. Nothing can be more natural than that Prince BISMARCK should support Austria in this matter. He of all men would be the first to feel acute pain at the possibility of any set of people escaping the universal lot of Continental man, and not being obliged to fight; and it was to combat Slav pretensions, and to counterbalance Slav power, that he invented, and has adhered to, the Austrian alliance.

There is also a small quarrel going on between Austria and Roumania to which attention has been directed by the KING's speech at the opening of the Roumanian Session. What the KING said was, in effect, that Austria was trying to bully Roumania, and to deny Roumania its just rights in the control of the Danube. It was a very strong step for the KING to take the question in this marked and public manner out of the province of diplomacy, and Austria at once signified its displeasure by directing its Envoy at Bucharest to cease all relations with the Roumanian Government. The KING said what he said partly because he is a HORENZOLLERN, and dared to say it partly because he knew that the difference between Roumania and Austria must be referred to Berlin, and he wished to provoke this reference without further delay, and partly, it may be supposed, because he was honestly convinced that Roumania was in the right, and could prove that it was in the right, if the attention of Europe was called to the controversy. Two questions regarding the Danube divide Roumania and Austria; the question of the supremacy of Austria in the general Commission of regulation, and the question of the dependence or independence of the local police of Roumania in waters that flow between banks both of which are now Roumanian. Austria claims a supremacy because she is much the greatest Danubian Power, and because she has undertaken to spend a large sum of money on the improvement of the navigation of the river. Roumania has no objection to Austria having any amount of honorary distinction in the Commission; but wishes to secure that, when any question arises that specially affects its interests, Roumania shall not be liable to be systematically outvoted. Austria claims that its general superintendence of the Danube shall not be subordinated to any rules of the Roumanian local police. Roumania claims that her local police shall have as full authority as the Austrian local police has where the river flows through purely Austrian territory. In an indirect way Germany and Russia are interested in the quarrel; Germany because the Danube in its upper waters is a German river, and Russia because Russia now controls one of the mouths of the Danube. But the questions at issue are evidently of a character that ought to be determined, not by secret political interests, but by the principles of public law, which have gradually been evolved during the very numerous riverain controversies which have from time to time arisen and been settled. The KING of ROUMANIA chose a mode of appealing to these principles which was neither friendly nor courteous to Austria. But he may have thought that, unless he made his appeal in a manner which at all hazards, must command attention, he might never get a chance of making an appeal effectually. He appealed to Czar at Berlin, and to Berlin he and Austria have now got to go. Probably he felt secure on one important point, and calculated that any feeling of irritation which might be aroused in Austria would soon die away. At Bucharest relations have ceased between the two Governments; but the Roumanian representative at St. Petersburg has had a pleasant and friendly discussion with Count KOLNACKY, and at Vienna the operations of the Roumanian envoy appear to have been not only accepted but welcomed. There is no reason why bitterness should prevail while both parties are awaiting the decision of Prince BISMARCK.

In one of his recent speeches Prince BISMARCK went out of his way to make some observations on Italy, which the Italians have keenly resented. He said that Italy was weak because it was Liberal, and because, being Liberal, it was necessarily gravitating towards Republicanism. Signor MANCINI, the Italian Minister of Foreign Affairs, gave the best reply that circumstances permitted. He refused to argue with a Foreign Minister as to the ultimate tendencies of Liberalism, and merely called on his hearers to testify their devotion to their King—an appeal which met with an enthusiastic response. It is to be observed that it was not Italy's attitude towards the Papacy that provoked Prince BISMARCK'S criticism. He is always consistent in his views on religious questions. The State should, in his opinion, think of nothing but how it is itself affected by them. He justifies the May Laws not because they promoted culture, but because they put a yoke on a party that was trying to break up the Empire. He now justifies a repeal or a large modification of these laws because they annoy a party which he now regards as the best instrument he can find for preserving the Empire. His view of the German Empire is that it is and must be essentially monarchical, and it is because it is monarchical that it now possesses its commanding position and great influence in Europe. It is German Liberals that are now the real antagonists of the German Empire, as he understands the Empire. When, then, Italy asks to be admitted into the system over which he presides, he says that its general tendencies are not sufficiently in harmony with those which he wishes to see prevailing in this system, and are too much like those he perceives in the party in his own country which misunderstands the character of the Empire and the foundations of his system. Nothing could be plainer than the language of Signor MANCINI in explaining the motives which had led the Ministry to form the new alliance with Austria. Italy, he said, has been very badly treated by France, entirely declines to recognize the validity of anything France has done, or procured to be done, in Tunis, and altogether disbelieves the assurances of France that annexation is not intended. The Austrian alliance was nothing but a means of taking refuge in the only shelter open to Italy while this French storm was blowing. What other effects the alliance may have remains to be seen; but its first fruit may be said to be that, under its protection, Signor MANCINI has ventured to use language about France that he would certainly not have ventured to use if Italy had remained isolated. It is not unnatural that Prince BISMARCK should allow it to be seen that he does not set any very great value on an alliance that was brought about in this way. When a weak Power, having something to resent, implores an alliance that will allow it to give voice to its resentment, it can scarcely expect to be treated altogether as an equal by those to whom the prayer is addressed.

#### THE WHIGS.

AN essay on "The Position of the Whigs," published by Mr. MILNES GASKELL in the current number of the *Nineteenth Century*, describes the party as it now exists with remarkable accuracy. It is not evident whether Mr. GASKELL has any definite object in his sarcastic description of his friends and of their allies; but his motives concern himself, while his statements and arguments are both instructive and amusing. He delineates with accurate observation, inspired perhaps by sympathy, the unwilling acquiescence of the Whig party in Radical measures. Since the time of the first Reform Bill the Whigs have never regarded with favour the constitutional innovations to which they have ultimately assented. They took a principal part in the defeat of Lord JOHN RUSSELL'S little Reform Bills, ending with the comparatively moderate project of 1866. They paid the penalty of their mistake by submitting to the much larger measure of the following year, and they still more reluctantly acquiesced in the sweeping legislation by which Mr. GLADSTONE interpreted for the benefit of unwilling pupils the practical meaning of extensions of the franchise. According to Mr. GASKELL, the discontent of the Whigs contributed to the reaction of 1874; and they only rallied to the Liberal cause when a domestic controversy was temporarily superseded by the issues of foreign policy raised by Lord SALISBURY.

They were probably glad of a reason for renewing active co-operation with their nominal allies, and on the eve of the election some of them were in the habit of assuring anxious inquirers that the Liberal party had never before been so moderate in its views. Though genuine Whigs probably regarded with disquiet Mr. GLADSTONE'S appeals to popular passion, they hoped that the defeat of the Conservative Government would be followed by a period of calm. They contributed largely to the Liberal success of the general election; and it must be remembered that the Parliamentary leader of the Opposition had been for some time one of themselves. It is true that Lord HARTINGTON had on one or two occasions compromised his character for prudence. There is no doubt that his Whig followers regretted his overtures to the Scotch Nonconformists; but, with blamable rashness, they concurred in his proposal to extend the present borough franchise to counties. Mr. GASKELL, who is one of their number, appears still to think that it will be possible to manage large rural constituencies; and he considers the redistribution of seats which must follow as involving only questions of detail. There are others who fear that the transfer of all political power to the lowest and most numerous class of the population will put an end to Whigs and Tories alike. When Mr. GASKELL wrote he had not yet known that by a judge-made constitution the representation of the populace had suddenly been doubled or trebled in strength. Although the Judges have on reconsideration wisely allowed an appeal, there is reason to fear that their decision will be confirmed.

It is more than doubtful whether the secession of the moderate Liberals would be conducive to the public interest. They are separated by no serious difference of opinion from their nominal opponents, and they profoundly disapprove the doctrines and measures of their overbearing associates. As Mr. GASKELL says, the Whigs have for many months been firmly convinced that force is the only remedy for disorder; nor, indeed, was there any difference in principle between themselves and the Birmingham section of the Government as to the efficiency of coercion. Mr. CHAMBERLAIN attributes to force, as administered by the Land League, the beneficent consummation of the Land Act. Mr. BRIGHT, when he gloated over the image of Irish landlords running for their lives, knew that they also were impelled by material force. It is only when force is applied by constituted authorities for the maintenance of law and order that it is denounced as not being a remedy. It may be conjectured that Mr. GASKELL, though he reserves his own opinion, inclines to approve the forcible protection of life and property. He deviates from the modern standard of Liberal orthodoxy in disapproving the system of government by clubs and the incessant appeal of political leaders to meetings of their supporters. He perhaps takes too seriously such a declaration as that of Sir W. HARCOURT that he attended a meeting in Cumberland "to gauge and take soundings of public opinion." The people of Workington heard what the eloquent Minister had to say; but he can scarcely have supposed that when they cheered his attacks on the opposite party they were giving him any information as to the state of public opinion. Mr. GASKELL, affecting to interpret the appeal to the mob literally, suggests that, if Sir W. HARCOURT were made Archbishop of Canterbury, he might ask the opinion of the great towns as to the Decalogue. He may be well assured that the political convictions of Workington are wholly indifferent to Sir W. HARCOURT, except when they find expression in votes at an election. The profession of deference for popular opinion would be affected and insincere, if it were not known to be a commonplace fiction.

On another point Mr. GASKELL plainly indicates both his own political position and that which he attributes to the Whigs. He quotes the threats of Mr. CHAMBERLAIN and Mr. COLLINGS that the rights of landowners in Great Britain are to be attacked, with the comment that "they are in direct contradiction to Mr. GLADSTONE'S opinions as uttered at Leeds." It is unfortunately impossible to fasten on Mr. GLADSTONE any direct contradiction. The propositions which he enounces are almost always ambiguous; and, even when they seem to be clear, they are liable to be explained away. Mr. GLADSTONE will probably keep his promise of not passing an Irish Land Act for England; but he is quite capable of passing an English Act which may include the three *Es*, and of proving that it is not identical with the Irish

Land Act. In his speech at Leeds he spoke of protecting the tenure of the English occupier, which, as far as it exists, needs no protection. The occupier has during his term a tenure which no landlord ever thought of disturbing; and when his time has expired, his tenure simultaneously disappears. It is therefore uncertain whether Mr. GLADSTONE intended to create the tenure which he proposed to protect; and if he had no definite meaning, he may, as on former occasions, at any moment invent a new principle to justify subversive measures. Mr. GASKELL is confident that the Whigs who would assent to such a Bill as is foreshadowed by Mr. COLLINGS and Mr. CHAMBERLAIN are few in number. It is less certain that "Mr. GLADSTONE would obviously give no encouragement to an agitation for either free sale or "fixity of tenure in England." It is perfectly true that "property invested in land differs in the eyes of a moderate Liberal in no respect from property in mills, in savings banks, in the varied securities of the United Kingdom." The only difference is that landowners have few votes, and that since the institution of the Ballot neither they nor any other portion of the upper classes have any considerable influence in elections. The Farmers' Alliance propounds its scheme of undisguised and selfish plunder solely because its managers believe that they can vote away the property of the landlords.

The study of Whig anatomy and physiology is the more accurate because the essayist appears to be one of the subjects of his own analysis. A landed proprietor with connexions in both parties, and, as the tone of the essay plainly shows, a moderate Liberal, Mr. MILNES GASKELL has made himself known as an active politician, was chairman of an Association or Committee for promoting the Liberal cause in the West Riding at the last election, and he has contested one or more seats as a supporter of Mr. GLADSTONE. He may perhaps not altogether regret that he is not called upon to express by his votes the confidence which he not long since reposed in the eccentric leader of his party. The doubts and tendencies to criticism of the Government which he attributes to the Whigs are mentioned without any sign of disapproval. Mr. GASKELL seems not to differ widely from a politician who formerly held very different opinions, though he is not as plain-spoken a commentator on modern Liberalism as Mr. AUBERON HERBERT. It has always been certain that, as the Government advanced in its course of disestablishment and disendowment, it would alienate larger and larger numbers of its supporters. If its continuance in office depended on a vote of payers of income-tax, who would fairly represent the upper and middle classes, it would probably be defeated by five or six to one; but under the new Constitution, as for the present declared by a divisional Court of the Queen's Bench Division, the majority may perhaps be as large the other way. The downward progress of democracy is accelerated as it goes. The Republic which, according to the shallow forecast of THIERS, was to divide Frenchmen the least, has concentrated all power in a single party. It is not improbable that in a few years the English Whigs will have approached as near to extinction as the French Orleanists. In the meantime, they probably serve the country best by remaining as long as possible in the ranks of the Liberal party, in which they were once supreme. The secession is proceeding rapidly among their hamble adherents, and several of the great Whig houses have transferred their allegiance; but it is desirable that the final elimination of moderate Liberalism should be postponed.

#### THE TWO PRESIDENTS.

M. GREVY, whose own demeanour is in all respects what a constitutional President should be, is not equally happy in the journal that is understood to represent him. That there should be such a journal seems odd to our insular notions; but the Continental idea of the press is different from the English, and in France especially a man can hardly be called a politician if he does not own or edit a newspaper. Even M. SIMON, who leads the handful of politicians known as the Republican Opposition in the Senate, has conformed to this universal law, and those who care for the rare utterances of common sense and rational liberty that diversify the dead level of Republican dogmatism may now find them in the *Gaulois* as well as in the *Parlement*. In France, therefore, even the

President of the Republic has his newspaper, and the *Paris* has the honour of imparting to the public the views of the Chief of the State. It is permissible, however, to suspect that the articles in this journal occasionally indicate what M. GREVY's less prudent friends would like him to feel rather than what M. GREVY himself feels. It is hard, for example, to believe that the President has genuinely interested himself in the controversy which has lately been carried on between the *Paris* on the one side and M. GAMBETTA's numerous organs on the other, as to the correctness of the title of "Chief of the Executive" with which the latter have lately decorated their idol. M. GREVY's friends, no doubt, remember the peculiar position which M. THIERS occupied in 1871, and they may naturally feel alarmed lest the revival of the particular title which M. THIERS then bore may be designed as a prelude to an assumption of the exceptional powers which were then associated with it. But the title itself is one that can hardly be denied to M. GAMBETTA if it pleases him to use it. The President of the Republic is at once more and less than the Chief of the Executive. He has other than merely executive functions to discharge, and he does not discharge the specially executive function of affixing to a decree the signature which makes it operative. Under constitutional government the Chief of the Executive is the man who is responsible for the acts of the Executive—the man to whom the Legislature looks to take care that things go right, the man whom the Legislature blames if things go wrong. The President of the French Republic can hardly claim higher attributes of sovereignty than those which belong to Queen VICTORIA; but no Englishman would think of calling HER MAJESTY the Chief of the Executive. That is a title which, if it belongs to anybody, belongs to the Prime Minister for the time being. It is not in the least like M. GREVY to show irritation at a thing which he has no power to prevent; and we have little doubt that, if the remonstrances of the *Paris* could be traced to their source, they would be found to have their origin near, rather than in, the Presidential Chair. M. GAMBETTA may fairly claim to have a similar allowance made for the injudicious zeal of his headmen. The motive of their recent acts of homage may perhaps be detected in another expression which has given great offence to the *Paris*. The Corps Diplomatique was said in one of M. GAMBETTA's papers to have "defiled" before the Under-Secretary of State. The *Paris* treats the use of this term as a serious infringement of international proprieties. The members of the Corps Diplomatique, it says, do not "defile" before any one. A foreign ambassador represents the chief of the State by which he is accredited, and consequently has no equal in France except the President of the Republic. It would be nearer the truth, perhaps, to read in the erring expression a desire to glorify the particular Under-Secretary of State. It was only incidentally that the writer wished to degrade foreign ambassadors. They might be as great as they liked, provided that for one happy moment he could picture them to himself as a little lower than M. SPULLER. Probably the Psalmist was thinking of small politicians suddenly raised to good places when he wrote that "Man, being in honour, hath no understanding."

Still, though a floating straw may not in itself be very full of purpose, it has its proverbial use; and there is certainly something significant in the solitary position which M. GAMBETTA shows himself inclined to assume. That the President of the Council should allow himself to be spoken of by a title which has been given to none of his predecessors, and that this title should be one which belonged to the single French Minister who had not even a nominal superior, are small things in themselves. When, however, they fit in with M. GAMBETTA's general line of action, they become invested with some degree of meaning; and it must be acknowledged that they do fit in with this line of action very well indeed. M. GAMBETTA is, in name, the head of a Cabinet the members of which are jointly and severally responsible for the conduct of public affairs. Everybody knows what is the process by which such Cabinets are ordinarily put together. The men who compose them have worked together in opposition, and they have thus obtained that general knowledge of one another's views upon public questions which may be expected to fit them for working together in office. The programme of such a Ministry represents the resultant of the various ideas contributed by each separate Minister, and in this way it represents with more or less of accuracy the ideas which animate the party that has

placed the Ministers in power. This would have been the process followed by M. GAMBETTA if he had been able to include in his Cabinet the various ex-Ministers to whom he applied himself in the first instance. It is doing him no injustice, however, to suppose that his efforts to secure their services were of a somewhat perfunctory character. The stipulation made by M. de FREYCINET and M. FERRY probably was that they should exercise some moderating influence on the policy of the new Government. They did not care to take office under M. GAMBETTA if the sole function assigned to them was that of carrying out in their several departments the orders issued by the President of the Council. That this was the function which M. GAMBETTA intended to assign to them there can be little question. There was no such antecedent difference between his policy and theirs as to make it difficult for M. de FREYCINET or M. FERRY to become his colleagues. Each had in turn been virtually nominated by him as Prime Minister; and, if each had in turn been overthrown by the same omnipotent hand, it was for the working out of his own supreme purpose, not for any demerit of theirs. It is probable, however, that they knew enough of M. GAMBETTA to realize fully the necessity of a clear understanding as to the place they were to hold in his Cabinet. M. GAMBETTA had every inducement to make his answer to this inquiry as agreeable as possible. It had always been assumed that when he at last took office it would be as the chief of a united Republican party. Consequently, he could not have wished to proclaim to the country that, of the chiefs of the various sections into which the Republican party is divided, not one was willing to enter his Cabinet. It was not of M. GAMBETTA'S own choice that the great Ministry that had so long been looked for became in fact the very smallest Ministry, as regards every member of it save its chief, that has ever been known in France. He would have averted this consequence, we may be sure, if he could have done so without too great a sacrifice. But the one sacrifice by which it could be averted was also the one sacrifice which M. GAMBETTA was determined not to make. He would not resign or weaken his own sovereignty in the Cabinet. Rather than do this he was willing to accept one refusal after another, and to end by taking a Ministry of clerks.

There is some ground, therefore, for the apprehensions which M. GRÉVY may be supposed to entertain of M. GAMBETTA'S intentions towards himself. There is not the slightest probability that M. GRÉVY will ever depart from his constitutional position, or attempt to place any restrictions on M. GAMBETTA'S freedom of action. He has no reason, therefore, to fear the result of a conflict into which he is determined not to enter. But it is conceivable that M. GAMBETTA may sustain a check from some other quarter than the PRESIDENT of the REPUBLIC. It is not his Ministers alone that he thinks ought to be in strict subordination to himself. In his own conception of the ideal State he probably assigns a scarcely less dependent position to the Legislature, and though at present there is no sign on the part of the Deputies of any disposition to quarrel with the place it pleases him to give them, it is impossible to say how long this state of things will continue. The habit of combination against any and every Ministry is very inveterate in the French Chamber, and it may by and by revive to M. GAMBETTA'S injury. If that should come to pass the President of the Council is not unlikely to compare his own precarious existence with the septennial life of the President of the Republic. It long seemed doubtful whether M. GAMBETTA meant to become President after M. GRÉVY or Prime Minister under M. GRÉVY, and, though circumstances have led him to take the latter office, he may still regret that it should have been forced upon him. To a man of M. GAMBETTA'S personal ambition, there must be something very attractive in the freedom from vexatious interference which belongs to a Chief of the State who is elected for a fixed period; and if, as in the United States, he enjoyed the further advantage of being elected by, and therefore responsible to, the country, not the Legislature, even M. GAMBETTA'S imagination could hardly conceive a post of more uncontrolled authority than that of President of the Republic. The actual holder of an office which, if it is not already, might easily be made, all that M. GAMBETTA thinks it desirable to have, may be pardoned if he feels that his own tenure of it is not perfectly secure.

#### REFORM OF PARLIAMENTARY PROCEDURE.

ONE Liberal member after another goes down to his constituents and tells them that before all things it is necessary to get the procedure of Parliament changed. The object of the change is universally described to be the removal of the obstacles which make it difficult for Parliament to legislate as much as it ought to do, and in the way it ought to do. Measures that are needed cannot become law because Parliament, although it has the will, has not the time to pass them; and measures that are passed are passed in bad form because they are mangled in their passage through Parliament. But, although all these speakers are agreed in saying that something strong and sweeping ought to be done, they are all equally agreed in avoiding the puzzling question what it is that they really mean. It is a relief, therefore, to find a Conservative member coming forward with definite proposals. Mr. CLARKE, at any rate, makes definite suggestions. He gives us something to discuss; and the same service has been done, not in a speech, but in a book, by Mr. TORRENS, the Liberal member for Finsbury. The value of the suggestions made may be great or small, but their general nature, and the fact that they come from the two sides of the House of Commons, suggest two reflections, which force themselves more and more on the mind of every one who gives serious attention to the subject. The first is that the reform of Parliamentary procedure is not, and ought not to be allowed to become, a party question. If Parliament can be made to do its work better, the improvement will benefit Parliament as a whole, and not one party more than another. And, as the benefits of a good reform will be shared by all, so will the evils of a bad reform. A Liberal, if he is really a Liberal, ought to be the most conservative of Conservatives in maintaining the freedom of debate and the rights of minorities. And then it must be remembered that the question is not at all a new question. It has been discussed at intervals for a quarter of a century, and the discussion has been quite as much the work of one party as of the other. It may perhaps have been first started by the late Lord DERBY, and it was continued by a Committee over which Sir JOHN PAKINGTON presided. The second reflection is that the work which it is proposed to take in hand is one of extreme difficulty. Every proposal is open to numerous objections. It may be wise to face these objections, and adopt the proposal in spite of them. If something must be done, the choice may be between two evils, and the smaller may have to be chosen. But every proposal that has been made, or that can be made, is open to so many objections that nothing but very free discussion and the authority of those of both parties who possess long Parliamentary experience can show which evil is the smaller. Just as the past history of the question shows that it is out of the proper range of party quarrels, so it also shows that the question is very puzzling and very intricate. Committee after Committee has been appointed to make suggestions; and, after patient consideration, has reported that it has had no suggestions to make, and that the only thing to do was to trust to the good sense and good feeling of members. All these Committees were earnest in the wish to suggest something feasible; but they all found, to their disappointment, that they could think of nothing which they themselves could not immediately pick to pieces.

No one could be stronger than Mr. TORRENS in denunciation of the present confusion and waste of time which characterize the legislative proceedings of the House of Commons. But when we examine what he considers to be the root of the mischief, we are surprised to find that his conception of the fundamental error of our system of legislation is precisely the opposite of that which is put forward by Mr. GLADSTONE and most Liberal speakers. They think that Parliament, owing to its defective procedure, does not legislate enough. Mr. TORRENS thinks that Parliament legislates far too much. A very few Bills, passed very slowly, is his ideal. He compares a Bill to wine in a cask, and says that the longer a Bill is kept in its passage through Parliament, the better and mellowed it will be. He has the courage of his opinions, and selects the Irish Land Bill as an instance. It would, he thinks, have been a most advantageous thing if the Lords had not rejected it, but had been in a position to take it up next Session at the point at which it came to them. They would thus have had an opportunity of thinking over it quietly in the recess. It

would then, to continue his simile, have had a full ripe flavour imparted to it, such as is given to brown sherry that has been sent round the world. This may be a good theory of legislation, or not; but at least it shows the extreme divergence of views to which thinkers, even of the same party, are led when, professing to start from the same point, they lose themselves in the labyrinth of Parliamentary procedure. Mr. GLADSTONE deplores that he cannot legislate enough; and one of his followers urges that the one Bill of last Session ought to have stood over, that the Peers might think over it in the recess. And Mr. TORRENS goes further. He stoutly maintains that last Session was wasted; but it was wasted, not because the Coercion and Land Bills were debated at undue length, but because both measures were futile. This objection takes us altogether out of the region of Parliamentary procedure. The criticism that Parliament has passed two bad Bills is directed, not against the mode in which the Legislature works, but against the capacity of Parliament to act as a legislative body. Mr. CLARKE, who, although much newer to Parliamentary life than Mr. TORRENS, never loses his contact with real life, and when he makes a suggestion considers how it will practically work, also favours the proposal, which has much to recommend it, that Bills should be taken up at the stage which they had reached in the preceding Session. Precious time would thus be saved, and what Mr. CLARKE considers to be equally important, the Bills would be improved; for, as those in charge of a Bill would not consider their measure lost, they would be content to let it be postponed until it could be attentively considered. He has certainly a most extraordinary instance of rapid and inconsiderate legislation to adduce. In 1878 a Bill was brought in, regulating among other things the lodger franchise. Fortunately an appeal from the late judicial interpretation of the clause has now been allowed, so that it still remains to be seen whether it was so drawn as really to introduce manhood suffrage into large towns. There was only one member of Parliament in either House who raised any objection to this extraordinary clause, and, when he was told by one Conservative member and one Liberal member that the clause as drawn would scarcely have any effect, he sat down, and it passed without further discussion.

Mr. CLARKE thinks that if the Bill could have been postponed until the following Session, instead of being rejected, the Government would have at once acquiesced in a proposal to postpone it, and that in a subsequent Session some one would have been sure to hit the blot. Unfortunately, it is most improbable that anything of the kind would have happened. The Bill was the work of a Conservative Government, which liked the clause in the shape given to it, which would have recoiled from a sudden and secret extension of the suffrage, and fully believed that what it proposed could not receive an interpretation that would be mischievous. Every one of every party, except Mr. CHORLEY, was under the same mistake; and he yielded at once when he found that private members on both sides took the same view as the leaders of his own party. If under such circumstances the Government had consented to postpone the Bill, it could not have carried any Bill whatever. One member on the Government side asks for explanations on a clause in a Government Bill, receives them, is satisfied, and sits down. Why should a Government decline to go on with a Bill, and get it through Parliament in the Session in which it is introduced, because some little doubt is expressed for a few moments by a single member as to the meaning of a clause which to the Government seems perfectly clear and perfectly harmless? And this points to the real objection to the proposal for taking up Bills in a succeeding Session at the stage they have already reached. It would help legislation, but it would also impede it. Every Government would find it much more difficult to get its Bills through Parliament if it was always open to the invitation to defer going on with a Bill for a few months. The motive power that practically gets Bills through Parliament is the reluctance of the majority that the Government of their party should be defeated. To ask for postponement would seem, not to defeat the Government, but to appeal to its equity and courtesy, and the appeal would be made by its supporters as well as by its opponents. The mischief of weakening the Government may be less than the mischief of Bills being passed without due consideration; but at any rate it is a mischief that deserves to be considered. The minor sugges-

tions of Mr. CLARKE and Mr. TORRENS all seem open to the same method of treatment. The suggestions themselves suggest the objections to them. Both, for example, approve of counting out a debate; so that, if forty members do not wish it to be continued, the House may go on to other business. The obvious objection to this is that members who have something of importance to say, but for which public opinion is not ripe, may be deprived of all chance of submitting their views to Parliament. To avoid this, Mr. TORRENS suggests that every debate should go on for two or three hours before the count-out extinguishes it. If so, the proposal comes to nothing, for three hours of public time may always be wasted. Mr. TORRENS, again, has an elaborate scheme, by which all the Committee work of the House would be undertaken, not by the House, but by what he calls three grand panels of 200 members each. This, he thinks, would be a great saving of time. The House would, in his metaphorical language, have three steam-engines at work at once. We naturally ask, when would these steam-engines work? and we find that Mr. TORRENS is obliged to limit their working to the hours between twelve and four on Tuesdays and Fridays. The suggestion that the House could efficiently get through all its Committee work in two weekly periods of four hours each, at a time of the day when every business man would be in the City, every lawyer in court, and every Minister in his office, may be left to refute itself. It may also, however, serve to swell the list of instances which show how much easier it is to talk about improving Parliamentary procedure than to improve it.

#### AFGHANISTAN.

IN the numerous utterances of supporters of the Government during the last week or two, nothing has been more frequent than an expression, in one form or another, of the opinion that the Afghan question is "dead." It is very much to be wished that it were; but unfortunately it appears to possess all the troublesome vivacity of John Barleycorn. It insists on getting up again and sore surprising the God-granted Government—it is a well-known Afghan phrase—which believes that it has settled it for ever. During the last few days there has been published a Blue-book of further correspondence relating to Afghanistan, and some very important news from the country itself, which throws much fresh light on the question, while the Blackburn speech of the INDIAN SECRETARY is hardly obsolete. In the Blue-book itself there is little but historical interest. One phrase may perhaps save it from utter oblivion, because of the illustrative light which it casts on Mr. GLADSTONE's theory of the moral barrier. The writer is the present Ameer of AFGHANISTAN, and the occasion of his writing is the demand of the Indian Viceroy for an Afghan Envoy. "A thoroughly confidential man," replies ABDUL RAHMAN, "does not (as your Excellency is well aware of the "nature of the people of Afghanistan) exist in this "country." Apart from this instructive confession, there is little in the Blue-book which does not belong to ancient, and now well-known, history. It breaks off, indeed, between the defeat of GHOLAM HYDER and the subsequent victory of the AMEER's troops; nor is there much, if anything, in it which deserves particular notice, except the unsatisfactory details of the black-mail arrangements for keeping open the Khyber, and the evacuation of Candahar. It contains, indeed, abundant data for estimating the attitude of the AMEER towards the British Government. That attitude may be said to be made up of a great desire for rifles, breech-loading cannon, cartridges, lakhs of rupees, and other varieties of portable property, and of a firm intention not to receive an inconvenient British Envoy—even a native one—on any terms whatever. But the existence of this state of mind on the part of the AMEER—and, indeed, of all Eastern princes—was sufficiently well known already. Nothing else, save the curious contrast of the unanswerable demonstration of the Indian Council (which, it need hardly be said, is not now a "Jingo" Council by any means) as to the retention of Pishin and Sibi, and the obstinate refusal of the English Government to do more than postpone the evil day, is contained within these covers.

If it is worth while to take up Lord HARTINGTON's speech so long after its utterance, it is only because the

speaker himself is not prodigal of extra-Parliamentary speech, and because of the important light which has been thrown on the Afghan question by subsequent news. Lord HARTINGTON's remarks on Afghanistan at Blackburn exhibited him again in the curious position which he has more than once held. No one questions Lord HARTINGTON's honesty, or his common sense; and, if certain unfortunate incidents, like that of the Army Discipline Bill, make some people question his backbone, that is a quality which, though it is the most invaluable one that a statesman can possess, is perhaps the most seldom called into play. But, unluckily, honesty and common sense, even if backed by a strong will, are not quite sufficient for the satisfactory settlement of State affairs. There is a fourth quality, which, for want of a better name, must be called knowledge; and it is more than ever obvious that Lord HARTINGTON has not taken the trouble to provide himself with this. His bland announcement in the early days of the quarrel about Candahar, to the effect that no argument or demonstration would move the Government from its preconceived determination to evacuate the city, has not been forgotten, and his attitude towards Afghan questions has been consistent throughout. No statesman who had taken the smallest pains to examine the history or the merits of the matter could have committed the inconceivable blunder of describing Afghanistan as a "neutral" country. No one who had even a rudimentary acquaintance with the facts could sneer at the importance of the Transcaspian railway, or affect to question the interest of England in the fact that independent Turkestan has been practically blotted out of the map of the world. Every allowance must be made for ignorance, and it is quite certain that an ordinary person is entirely excusable if he fails to appreciate the enormous difference which the last four or five years have made in the defensibility of India. It takes some trouble merely to go through the facts, more still to comprehend them. But it might be at least expected that a Secretary of State for India should not openly display his ignorance of them. To Lord HARTINGTON, no doubt, the recent news from Afghanistan is a thing of which he would quite innocently like, in his own words, "to be told how the interest or "honour of the country is involved in these events." This news is put briefly as follows. The great danger of Afghanistan as far as England is concerned is the existence of a divided but nominally independent Government. According to a plan which was perhaps too hastily abandoned by the late Government, Herat would have been re-united to Persia—a step which, accomplished as it would have been under British protection, would have made the recent encroachments of Russia on Khorassan impossible, and would have riveted the more than doubtful friendship of the SHAH to ourselves. Candahar would have been not directly annexed, but governed under a kind of protectorate by SHERE ALI KHAN, or some more capable governor, and Cabul, with its points of vantage towards India secured, would have been left to the reigning Ameer. This plan was given up for reasons not necessary to enter into, and the whole action of the present Government has been concentrated on the alternative plan of uniting all Afghanistan under ABDUL RAHMAN. They have lavished war material and money on him; they have retired from almost every point of vantage gained in the late war; they have pressed on him the importance of making his authority felt all over his nominal country. AYUB, his quondam rival, is a broken fugitive in Persia. Yet it by no means appears that ABDUL RAHMAN's authority is on the point of being established. Mere tribal disturbances in the East and South are of no importance. But it is rumoured, apparently on very good authority, that the Governor of Afghan Turkestan and the captor of Herat, MAHOMED ISHAK and ABDUL KUDUS, are by no means inclined to give up their quasi-independent authority. It may be remembered that the AMEER's regular troops had remarkably little to do with the capture of Herat. ABDUL KUDUS, his emissary, joined himself to the practically independent highland chief ANSIA KHAN and his Obar Aimaks, defeated the LUINAR, marched on Herat, and entered it. The proceeding was very much as if an emissary of one of the early STUART Kings of Scotland should have joined an Earl of CRAWFORD or an Earl of ROSS in the capture of Aberdeen or Inverness. Now, it seems, ABDUL KUDUS warns the AMEER that "the Heratis are not prepared to accept further

"change." It is not surprising that those who have watched Afghan affairs see in this a project to detach Herat and Turkestan from the AMEER.

Now it will be perfectly evident to any one who has taken the trouble to acquaint himself with the facts that it is exactly in Herat and Turkestan that English interests lie. Cabul, and in a manner Candahar, are, notwithstanding our withdrawals, still within the range of our influence, and are beyond that of Russia for the present. We still possess at Peshawar and Quetta bases from which we can act upon them, and, despite the reckless way in which the advantages gained at the cost of so much blood and treasure have been squandered, we still have routes alternative to the Khyber and the Bolan by way of Kurram and Hurnai, which can be utilized without much trouble. But in the further provinces we are, since the retirement from Candahar, utterly powerless, while it is precisely on these provinces that those conquests of Russia which Lord HARTINGTON seems to regard as situated in Saturn or Jupiter enable the Russians to bring their influence to bear. Between Tashkend and Balkh, the last nominal obstacle (it has for long been not more than nominal) has been removed by the servile declarations of the Ameer of BOKHARA. Between the Caspian and Herat the way has literally (whatever Lord HARTINGTON may think) been made easier and shorter than the way from Bombay to the Khojak. The value of a neutral Afghanistan, to use the INDIAN SECRETARY's strange phrase, might in any case be small; but, small or great, it must obviously depend on the country being united. In the case of an even nominally independent Herat-Balkh principality, it is scarcely necessary to say whose nominee the Prince would be. There would be no impropriety in Russia's exercising her influence. On the contrary, she would be simply following the principles which govern every State in the wide world, from her autocratic self to democratic America, from monarchical Germany to republican France, with the single exception of England under a Radical Ministry. That the next step would be that boundary of the Hindu Koosh of which some people talk so glibly cannot be doubted. The neutrality of Afghanistan, which is the INDIAN SECRETARY's latest discovery, would, under those circumstances, be perhaps one of the most curious neutralities which the world has known since diplomats invented the expression.

#### IRELAND.

IT is natural that the professed supporters of the Government should be rejoiced at the result of the election for County Londonderry, and it is perhaps only surprising that their satisfaction should wear something of the appearance of relief. Had the IRISH SOLICITOR-GENERAL been defeated, the idea of human nature would have had to be reconstructed, unless the supposed alliance between Conservatives and the "Catholic vote" had taken place. It was tolerably obvious beforehand that this alliance existed only in the wishes of Mr. O'DONNELL and the imagination of partisan writers; while the result of the poll proved it completely; fewer votes having been given for Sir S. WILSON than for Mr. ALEXANDER last year. Nor is it at all probable that the so-called Catholic vote—if by that is meant the vote of Roman Catholic Land Leaguers—is strong in Derry. The Irish Northern farmer is usually Protestant, has not lost his ancestral Scottish shrewdness, and is certain to prefer half a loaf on the right side of the legal hedge to a whole one on the wrong. Of this peculiarity Mr. PORTER and his partisans availed themselves to the very utmost of the elastic tether of election proprieties. The manner, indeed, in which the Derry election was won is a curious study in the ethics of bribery. The IRISH SOLICITOR-GENERAL had no need of a clumsy and dangerous box of sovereigns, or of agents likely to compound in the day of petition for their own sins by denouncing their neighbours'. The rent-roll of County Londonderry was his persuasion-fund, and all the Sub-Commissioners under the Land Act were his men in the moon. "Vote for PORTER, and you will have from twenty to forty per cent. taken off your rents" was the cry which has returned, and in the nature of things must have returned, the second Law Officer of the Crown in Ireland. It is said that the defeated candidate's threat of a petition in consequence is something more than a natural outburst of spleen. But the laws of bribery

were not framed with a view to the Irish Land Act, and there will probably be some difficulty in proving that Mr. PORTER overstepped the limits of legality in the slightest degree. The comparison between his fate and that of Mr. EDWARDS of Sandwich is all the more instructive to those who can appreciate the irony of human affairs. They both adorn the same profession; they are both members of the same political party; they have both worked in the same cause by appealing to the same eternal principles. Legally, it may be possible no doubt to point out the parting of the ways which led the one to the Palace of Westminster and the other to Canterbury gaol; from any other point of view than that of law it is not so easy.

Of more importance perhaps than the maintenance of a Government seat by such means as these is the still burning question of the anarchy of Ireland. No one has attempted to impugn the statements of Mr. Justice FITZGERALD at Cork on Tuesday, to the effect that in the province of Munster "life continues to be insecure, or is rendered so miserable as to be almost worthless"; that "the humbler classes continue to be oppressed by an odious tyranny," and that the present state of things, "if allowed to continue unchecked, threatens the very fabric of society." It is impossible to quarrel with these words in face of the almost daily news of murder and murderous outrage, and of the deliberate and persistent refusal to perform contracts. The last shift of the English abettors of anarchy is to maintain that it is the result of coercion; that the fire-engine is responsible for the fire. To argue with such persons would be absurd, and the only reasonable thing to do with them is to take the grain of truth which, as usual, lies at the bottom of their absurdity—the truth that the Government, by whatever use, abuse, or neglect of the means at their disposal, have failed to do their duty with those means. It is not too late for some improvement in this respect, and the announcement made as to an increase of the Constabulary is a step in the right direction, though a slow and hesitating one. The reinforcement of the Irish Constabulary by a thousand men chosen from the Army Reserve will be unquestionably valuable if it can be effected at once, and if good men can be got in this way. A suggestion which distinguishes itself amidst the vast mass of newspaper correspondence on the subject is that the Constabulary are at present both harassed and disabled from attending to their proper duties by the custom of sending large bodies of them, in company with the military, to superintend and protect evictions. Soldiers are in their proper place on such occasions, are intended to be used in masses, are (or can be) at hand in quite sufficient numbers for the purpose, and would be doing nothing else if they were not so used. On the other hand, every body of policemen which is detached on a day's duty of this kind might, if it were free, be broken up into dozens or scores of patrols, constantly scouring the country and protecting the peaceable inhabitants. It is this constant patrolling (by mounted men, if possible) which is the only thing to be relied on, both for the prevention, and, for what is better still in this case, the sharp and immediate punishment of the malefactors. It is not too much to say that the catching, red-handed, of a single gang of Captain Moonlight's ruffians would do more good than the shutting up of a thousand platform orators in Kilmainham or the successful prosecution of a hundred Ladies' Land League viragoes. If to this sweeping of the country for the purpose of catching the evildoers there were added some effectual mode of securing a fair trial of the evildoers when caught, more would have been done to reduce Ireland to order than all that the Government has done yet.

It is true that, even were these steps taken, one exciting cause of anarchy, the action of the Land Court, would remain. The proceedings of the Commissioners themselves in Dublin have recently been such as to encourage a hope which the conduct of their roving deputies had dashed not a little. The decision of Messrs. O'HAGAN and VERNON, despite their colleague's dissent, in favour of a natural and not a non-natural construction of the Act in the case of a tenant whose lease had expired before it came into operation, has been followed up by a series of other decisions in reference to existing leases, in which it is once more possible to recognize principles of something like a legal character. The complaint, however, which has been made of the postponement in favour of these comparatively unimportant cases of the hearing of appeals from the Sub-

Commissions seems to be well founded. So long as it is not known, from the results of a sufficient number of test appeals, how far the Commissioners uphold the wild practice and wilder doctrines of their deputies, so long will the tenants be excited by possibly illusory hopes of plunder. In particular, the question whether some of the Sub-Commissioners are to be supported in their opinion that what a landlord has bought and paid for in past years by the concession of a lease is to be taken away from him without compensation, ought to be decided with the least possible delay. At present both parties—the landlords and the tenants—are injuriously affected by the uncertainty prevailing. It is impossible for the former to decide what course to take in the altered circumstances of their property, and it is almost inevitable that the tenants should be unable to settle down to anything like a sober and businesslike frame of mind. It has to be remembered that in many, probably even in a majority of cases, the application of the tenant for a judicial rent by no means implies an undertaking on his part to pay that rent. It is a speculation, a form of gambling in which the tenant has two cards to play—"fair rent" and "no rent"—and in which he reserves his right to play the latter if he is dissatisfied with the result of the former. This attitude of mind is distinctly encouraged by the delay which is occurring in the settlement of the question how much a tenant is likely to get as a matter of final award from the Land Court. In fact, the only course which seems to be in the least likely to bring about a settlement of Ireland on Mr. GLADSTONE'S lines necessitates a prompt threefold action on the part of the Court, the Government, and the landlords. If the Court hastened to settle finally test cases of various kinds and from various districts so as to indicate the probable reduction to be expected; if the landlords, especially the larger landlords who can afford it, at once systematically put in force the rights of ejectment which the law has left them in case of refusal of rent; and if the Government, by multiplying patrols and taking steps to ensure the fair trial of agrarian crimes, show a determination to put down lawlessness, affairs will soon be brought to a crisis. It is not necessary to prophesy the precise nature of that crisis; but it is, after the course which Mr. GLADSTONE'S Government has hitherto adopted, the condition most likely to bring about a settlement in Ireland, or to rescue her from her present lingering disease of suspense and anarchy. The reported decision of the LORD MAYOR to set on foot, with at least the acquiescence of the Government, an English branch of the Property Defence Association, may assist the hastening of the crisis. It will certainly be a counterpoise to the American support of the Land League, and an encouragement of the greatest importance to the well-disposed.

#### THE LAND QUESTION IN SCOTLAND.

SIR BARTLE FRERE has published in the *Nineteenth Century* an account of the changes which he has observed on visiting Aberdeenshire after an interval of six years. He left landlords and tenants on amicable terms, except for some discontent caused by undue preservation of game; either class being not so much content with its own condition as unaware that any organic change in their respective relations was possible. The owner received the rent which a tenant agreed to pay; and it was understood that, under the system of leases for nineteen years, the occupier had the opportunity of recouping himself for any outlay which he might have found it expedient to make. At the end of the term both parties were remitted to their original independence of one another, and the rent was raised or lowered, or remained the same, according to its market value, ascertained by bargain. During the continuance of the system there have been many bad seasons, but until now it never occurred to the tenant that he could escape from the fulfilment of his contract. Having been engaged in totally different matters, Sir BARTLE FRERE finds on his return an agitation for the transfer to the tenant at the end of the term of the reversion, subject to payment which will still be called a rent. The price of further enjoyment of the land is to be determined by the arbitration of a tribunal, to the utter and final abolition of all freedom of trade in land. It is not stated whether the Aberdeenshire farmers have rivalled the cynical contempt for justice of their allies at Bedford and else-

where in England. The adjudication of the respective rights of landlord and occupier by two tenant-farmers indicates the opinion which Mr. HOWARD and his friends entertain of Mr. GLADSTONE's intellect and character. In other respects the Aberdeenshire agitators are at least as revolutionary as the English Farmers' Alliance. Mr. BARCLAY lately avowed with perfect candour that it was their object to transfer rights of property, which, as he added, was the only effective mode of reform. The agrarian agitators of the present day rival the cynicism of the French judge who is said during the Reign of Terror to have ejected a landowner who inherited from a long succession of ancestors, on the ground that his family had enjoyed the land long enough.

The causes of the change which has taken place are much more political than economical. Aberdeenshire has scarcely been affected by American competition; and it is more independent of fine seasons than regions with a more genial climate. Little or no wheat is grown in the county; and there has been no remarkable diminution in the crops of turnips or of oats, which have no American rivalry to fear. It is possible that, nevertheless, there has, even in Aberdeenshire, been a certain agricultural depression. The farmers may have found that, like those who are engaged in other commercial pursuits, they may in their current leases have sometimes made disadvantageous bargains. They would be exclusively entitled to the profits which might have been realized in good seasons with high prices. They suffer the whole loss in opposite circumstances, except that many of them rely with reason on the indulgence of their landlords. Ordinary railway shareholders receive the whole increase of the earnings, while debenture and preference shareholders are limited to their stipulated rate of interest. Conversely, the fixed dividends may perhaps in unfavourable times absorb the whole returns, leaving the more speculative shareholders to starve. Tenant-farmers are so far in a better position that they have the opportunity of readjusting their contracts as often as their leases come to an end. As Sir BARTLE FRERE remarks, both farmers and labourers have in modern times the means of escaping from undue pressure by threatening or resolving to emigrate. In many cases landlords, even during the continuance of a term, would be inclined to retain a good tenant at the cost of reasonable concessions. In the large part of England in which leases are almost unknown the tenant has for the last two or three years had the landlord at his mercy. Few owners are able or willing to cultivate their land themselves; and they sometimes find it impossible, even by great sacrifices, to induce tenants to remain. For the reasons which have been stated, the Aberdeenshire farmers have been comparatively exempt from the losses which have been incurred elsewhere.

The agitators whom they are disposed to follow have been stirred to activity, not by bad seasons or foreign competition, but by the accession of a Government which is supposed to have revolutionary tendencies, and by the introduction of the Irish Land Bill. Mr. GLADSTONE's followers perhaps do him injustice in believing that he is prepared to yield any boon which may be demanded by electoral majorities. The farmers may fail in argument, but they can easily outvote the landlords, and they hope that agitation will effect in Great Britain the results which are due in Ireland to outrage and to murder. When Mr. GLADSTONE declared at Leeds that he would introduce no Irish Land Bill for England, Mr. HOWARD significantly observed that Mr. GLADSTONE perfectly understood what was wanted, and that before he disclosed his policy he only wished to be backed by popular agitation. It is to be hoped that Mr. GLADSTONE's flatterers think too meanly of his honesty and firmness; but for the present they judge him by his acts. The author of the Irish Land Bill cannot rely on the principles of freedom of contract, which indeed he has expressly relegated, with other doctrines of political economy, to Saturn and Jupiter. The agrarian revolutionists are perhaps well advised in preferring the most extravagant claims, though they may not hope for the present to obtain perfect success. They demand not only arbitrated rents, but fixity of tenure, irrespectively of the terms of their leases. The Irish tenants could allege a more or less generally recognized custom, by which they remained in their holdings as long as they paid their rents. A stranger who ten or fifteen years ago made a bargain with an owner for the use of his land for a limited time now coolly insists

that he is entitled to a perpetuity. The proposals for the abolition of settlement and entail are inserted in the programme for purposes of ornament. The occupier at an adjudicated rent, with a perpetual right of renewal, will care little whether the rent-charge, as long as it also is not legislated away, belongs to the eldest son of the landlord, now reduced to the condition of an annuitant, or is divided among his children. The conscious injustice of the attack on ownership of land has been strikingly illustrated by the abandonment of the sham agitation against the existing land tenure. In no previous political movement has simple cupidity asserted itself with so little attempt at disguise.

If the soil of Aberdeenshire is to be arbitrarily taken from those who have acquired it by purchase or inheritance, it may well be asked why the tenant-farmers should be preferred by Parliament to other claimants, equally well entitled to the proceeds of legislative robbery. The labourers will probably wish to acquire gratuitous freeholds, although the more extreme communists are already protesting against their exclusive claim to the land, which is said naturally to belong to the whole community. It is true that the Farmers' Alliance and similar bodies care little for abstract justice, and that they place their whole dependence on their power to control county elections. Mr. GLADSTONE paid promptly and handsomely the debt which he had incurred to the seceding rural constituencies at the general election; but before he indulges in further displays of gratitude he will count the heads, not only of those who now possess the franchise, but of the future voters who are pressing at the door. At the next election it may be better worth while to buy the labourers than to pay additional bribes to the tenant-farmers; and it may be confidently assumed that the newcomers will not be deeply concerned for the interests of their immediate employers. The large farmers, who would gladly extend still further their areas of occupation, will have to try conclusions not with a small number of landowners, but with three or four times their own number of would-be peasant-proprietors. The abolition of entails would become an object of popular demand if it tended to bring small parcels of land into the market; and in that case it would result in the subdivision of farms. The introduction of the French system of succession, which may follow in course of time, would be fatal to the class on whose behalf the present agitation is promoted. As a general rule, it would not be advantageous to a tenant-farmer to purchase the fee of the land which he occupies. If any rich tenant could afford the luxury of becoming his own landlord, he would at once become devoted to the maintenance of the rights of property. It is easy to prove that the agrarian agitation is iniquitous in its objects; but it may be admitted that the managers trouble themselves little with attempts to prove the justice of their cause. Even the hypocritical affectation of a desire to increase the productiveness of the land has of late not been loudly urged. Covetousness of a neighbour's land scarcely troubles itself to assume a disguise.

#### MR. BRIGHT AT LLANDUDNO.

THERE were many things which Mr. BRIGHT might have said at Llandudno with profit as well as pleasure to his hearers. He might have told them a little about the processes by which he has trained and developed his extraordinary natural gifts, and has come, without, as he himself said, having much of what "high cultured people" call education, to be the most nervous and English of living orators. He might have contributed something to the vexed question, not how much ought children to learn—that has long ago been settled—but how much it is possible to teach them in the limited time, and under the unfavourable conditions, in which the education of the great majority of them must be carried on. He might have indicated what he and his friends mean when they speak of the political qualifications which come by education, and warned people against the common delusion that reading, writing, and arithmetic will somehow make a man a good citizen, without reference to what it is he reads, what it is he writes, or to what purpose his calculations are directed. He might have said something about the growing cost of elementary education, and ranged himself on one side or the other of the controversy as to how much of the necessary provision ought to be made by the com-

munity, and how much by those whose children directly benefit by the outlay. It is a question which needs to be threshed out, for the cost becomes greater every day, and the expedients by which it is met show that no firm grasp has yet been taken of the remoter considerations which are involved in it. Or, if he had been in an unwontedly gracious mood, he might have given a word or two of praise to those voluntary workers in the cause of education who did so much before ever Board schools were heard of, and have so well held their own since Board schools have been set up.

Upon not one of these things did Mr. BRIGHT touch. His speech from first to last was one long attack upon the old enemies with whom he has been fighting all his life. It was not political in the strictest sense, for no political names were introduced into it, but it was certainly political in the worst sense—in its constant appeal to class feeling, in its recurrent depreciations of every generation but our own, in its obstinate identification of things that have no relation to one another, in its refusal to draw even the most obvious lesson suggested by his own words when that lesson did not happen to square with the particular kind of legislation which Mr. BRIGHT favours. His remarks about temperance were a striking instance of this last fault. Some years ago Mr. BRIGHT said he met a Saxon gentleman who told him that sixty years back drunkenness was so common in his country that “if there was a man anywhere very drunk they would say he was ‘as drunk as a Saxon.’” Now, this gentleman said, you might use the very opposite expression. As sober as a Saxon has come to be as true as the less complimentary comparison was half a century ago. Mr. BRIGHT was naturally curious to know how this excellent change had been brought about, and particularly whether there had been any great change in the Saxon licensing laws. None, the gentleman said, that he could specially call to mind; the change had been made entirely by the schools. An admirable system of education had been established, and the result of it had been such an improvement in the character of the growing generation, “so much self-respect, so much knowledge of ‘what was due to themselves and to those around them,’ ‘so much sense of what would contribute to their own ‘comfort and happiness, that the vice of intoxication had ‘been almost banished from among them.’” It might have been thought that after this Mr. BRIGHT would have made it his business to learn something of the educational system which had worked this wonder, or, if he had no opportunity of doing this, that he would have recommended the Llandudno School Board to take the Saxon schools for their model, and have impressed upon them the superiority in all respects of sobriety which comes from education over sobriety created by law. So far from doing this, Mr. BRIGHT went straight from a demonstration that, in one remarkable instance, at all events, education had proved strong enough to deal with the vice of drunkenness, even when that vice was almost universal, to a glorification of the Welsh Sunday Closing Act, and to the expression of a hope that in this respect the example of Wales might be followed by England. It is hardly possible to conceive a more perverse *non sequitur*. The premisses point unmistakably to the conclusion so often insisted on by the opponents of prohibitive legislation, but the conclusion Mr. BRIGHT prefers to draw is precisely the opposite of that suggested by the premisses. Look at Saxony, he seems to say, and see how good schools can make a population sober without recourse to Acts of Parliament. Look at Wales, and see how it has preferred to take the less effectual method, and to rely on legislation to do the work which education can do much better. And from this Mr. BRIGHT deduces the inference that, England having the two examples before her, had better follow the example of Wales.

It is natural in a speech upon education to say something about Universities, and Mr. BRIGHT would have been wanting to himself and to the occasion if he had not had a fling at those ancient, exclusive, and wasteful institutions. No one would suppose from Mr. BRIGHT's reference to them that for the last thirty years Oxford and Cambridge had been devoting themselves with an almost exaggerated zeal to the work of reformation, and that every part of their machinery has been taken to pieces and reconstructed until, as in the case of the “rules called the Pie,” it has been more business to be found out what should be taught than to teach it when it was found out. Of all this Mr. BRIGHT

knows nothing. No one can be more judiciously blind than he to the amendment of an institution which he dislikes. But he might at least have given us his views upon the curious contrast which has by degrees grown up between the working of the University system now and its working in the unreformed days. Formerly every college at Oxford and Cambridge preserved traces, to say the least, of a system in which deliberate provision had been made for the education of the poor side by side with the rich. The old sizarships and servitorships were intended to carry out something of the same principle as has lately been tried—with, we believe, but scanty success—in the United States. The poor youth who was elected to one of them was to receive his education while at the same time he did work in the college. In course of time the original idea got perverted; and, instead of the sizars being youths to whom manual labour of this kind was natural, they were taken from a class who were unaccustomed to it. Instead of the labourer's son being enabled to dignify his work by study, the poor gentleman's son was expected to degrade his study by rendering menial service to his richer companions. The throwing open of endowments to unrestricted competition has swept away these anomalous offices. But the result has been that the old provision for the poor has been taken away, and no new provision put in its place. Where scholarships are gained by examination they naturally fall to the best-prepared boys; and this kind of preparation has now become such a recognized business that a boy has scarcely a chance of success if he has not gone through the forcing-house of a costly preparatory school. As the tendency of University reform is still in the direction of unlimited competition, it promises to become less and less possible for the poor to gain any benefit from them. We do not say that this result is avoidable, or even that it is to be regretted. All we care to point out is that, under the old system, the Universities which Mr. BRIGHT blames for giving their advantages mainly to the rich gave them very much more to the poor than is the case now. The poor have lost, not gained, by the work done in this reforming generation; and, when Mr. BRIGHT was surveying the whole field of human history, and picking out from it everything that could be made to tell against the generations that are gone, he might at least have praised them for the honest, if ineffectual, efforts they made to solve a problem which we have pretty well abandoned as insoluble. This would have been more suitable matter for a speech at the foundation of a school than eloquent but inaccurate generalities about the wickedness of war or the connexion between pauperism and the Land-laws.

#### M. PAUL BERT AND THE CONCORDAT.

WE have already more than once had an opportunity of expressing our opinion on the appointment of M. Paul Bert to the Ministry of Education and Worship in France and the line he has announced his intention of pursuing. If the Paris Correspondent of the *Times* may be trusted, the disquiet caused by this new departure in ecclesiastical policy is by no means confined to France. He says that as the signal of the anti-religious campaign has been given by a Republican Government in one of the leading countries of the Continent, Monarchical Europe feels the common interest at stake in the conflict, and recognizes the supreme necessity of guarding religion as one of the great auxiliaries of moral authority, and then he adds, “In this common anxiety differences of creed disappear, for it is felt that the assault threatens all creeds alike. At the advance of materialism every religion feels that its time is approaching, and that war has been declared against all, and it is not a question of Catholicism or of any other creed, but of all.” Such language is in curiously close accord with that of the great French Protestant statesman of the last generation, M. Guizot, who says in his *Meditations on the Christian Religion*, “It is in fact the whole Christian Church, and not this or that Church in particular, which is at present the object of attack in its fundamental principles. When the supernatural world, the inspiration of Scripture, and the Divinity of our Lord are denied, the blow falls upon all Christians, whether Catholics, Protestants, or Greeks.” If such fears were natural in M. Guizot's day, they are much more natural now, when the advancing secularism of the age has found so determined and influential an exponent in the new Minister of Worship in France. Our immediate concern however is not so much with M. Paul Bert's secularism generally, as with the particular instrument of oppression he proposes to apply for the discomfiture, and ultimate disestablishment, of the French Church. The Concordat and Organic Articles of Napoleon I. are henceforth, he announces, to be rigorously applied, and the various modifications or relaxations which have been gradually introduced during the period of nearly a century since

its original introduction are to be at once abrogated. As to the Organic Articles they may be dismissed in very few words. When M. Portalis, the minister of public worship, introduced the Concordat to the Corps Législatif on April 2, 1802, in an able and learned speech, he said not a word about these supplementary regulations which, as he well knew, had been surreptitiously appended to it by Napoleon after it had been signed by Cardinal Consalvi, and without the knowledge or consent of the Pope. Their general drift was to reduce the Church into direct and servile dependence on the civil Government; there were even restrictions imposed on the bishops as to the conferring of holy orders. The Pope protested in full Consistory against these Articles and demanded their suppression or modification, at the time without success. In some respects they were however found to be so unworkable that modifications have since been introduced from time to time, and—without, we believe, any formal agreement with Rome as to those retained—a practical understanding had been arrived at. How long it is likely to continue unimpaired under existing circumstances is another question.

But as regards the Concordat itself, apart from these accretions, there is an impression in many quarters, especially among those outside the Roman pale, that it is somehow a security for the liberties of the Gallican Church. And of course from the nature of the case any Concordat, as being a contract between the Holy See and the national Government, must in some degree restrict papal autocracy, and hence perhaps the remark of a leading Ultramontane divine of our own day that "the Church is always more at home in a Catacomb than in a Concordat." But the present question is not whether a Concordat may not more or less, according to its detailed provisions, promote the interests of Erastianism, but whether it serves to promote the independence of national Churches, which is quite a different thing. There is certainly no *a priori* reason for assuming that such would be the case, for the high contracting parties in every such agreement are the Pope and the Sovereign or Government of the country, who make terms with each other over the heads of the national episcopate and clergy, and therefore in possible disregard or contravention of their rights. But there is no need to discuss the question on *a priori* grounds. The Concordat between Pius VII. and Napoleon I., which M. Paul Bert desires strictly to enforce, is a document sufficiently well known in its origin, its substance, and its actual results, and is very far from being, under any of these aspects, the *Magna Charta* of Gallican liberties. The unprecedented and portentous assertion of Papal absolutism which was the essential preliminary and one may almost say leading principle of the Concordat—namely, the compulsory resignation or deprivation of the entire French episcopate, that the Pope might thereupon constitute a brand-new hierarchy, diminishing by about half the number of the ancient sees—would alone suffice to prove this. No such act had ever been attempted by the most autocratic and powerful of previous Popes. But we shall understand the matter better if we go back a little further in the history of the French Church. For the Concordat of 1801 was based, *mutatis mutandis*, on the Concordat of Bologna arranged in 1516 between Leo X. and Francis I., and the same principle in relation to the national Church runs through both alike. In the words of Mr. Jervis's *Gallican Church*, the best English work on the subject, "as in the sixteenth century, so at the opening of the nineteenth, the high contracting parties pursued their own views of interest, and reaped great mutual advantages; but the Church for which they professed to negotiate was at both epochs weakened and damaged rather than benefited by their agreement." And the Concordat of Bologna arose in this wise. The "Pragmatic Sanction" of St. Louis in the thirteenth century, constantly and justly cited as the *Magna Charta* of Gallican liberty, and styled by Pasquier "the foundation stone of the Gallican liberties," had declared that the French Church should be administered "according to the common law, the canons of Councils, and the statutes of the ancient Fathers"; it approves and confirms all ancient privileges and immunities of the Church, but contains no hint of the comparatively modern claims of Rome to the confirmation and institution of bishops, while it censures and prohibits for the future the exorbitant pecuniary imposts levied by the Papacy. But unworthy intrigues and violence on all sides prevented this salutary legislation taking any permanent effect. The Pragmatic Sanction of Bourges two centuries later was a second step in the same direction. It was a solemn protest against the encroachments of the mediæval Papacy, abolishing "reservations," "expectatives," "devolutions," "annates," and the like, prescribing canonical election of bishops and confirmation by the metropolitan—not, as Sir J. Stephen mistakenly supposed, their nomination by the Crown—and regulating appeals to Rome. But it had hardly been in force for twenty years when Pius II. induced Louis XI. to abolish it, on the ingenious plea that the liberties of the Church are but so many fetters on the absolute power of the Crown—and, he might have added, on his own. It was in fact from the first in evil odour at Rome, though received with universal satisfaction in France, and had been denounced both by Eugenius IV. and Nicolas V. as a blot on the French Church. Louis thought by abolishing it to get the control of the Church into his own hands, but he found himself bitterly disappointed. A half-century of chronic quarrels between Pope and King succeeded, and then Louis XII. made a futile attempt to restore the Pragmatic Sanction with the aid of the Council of Pisa. But he succumbed to the arms of Julius II. and the more astute policy of Leo X., backed by the fifth Lateran Council, an Italian synod, which claimed to be Ecumenical.

The final upshot of the contest was the famous Concordat of Bologna, concluded between his successor Francis I. and Leo X. in 1516, which differed in such important respects from the Pragmatic Sanction that it has been not unjustly said to constitute a complete revolution in ecclesiastical affairs, substituting absolutism—both royal and papal—for constitutional government. It was, in short, a private bargain between the King and the Pope whereby each party accorded certain privileges to the other, while the rights and interests of a third party, viz. the national Church, were sacrificed or ignored. It was thus totally irreconcilable with the true principles of Gallicanism; whatever was wrested from the Pope was appropriated to the Sovereign. The King, for instance, acquired the arbitrary nomination to bishoprics and some other benefices, to the final extinction of the primitive rule of free election, while the Pope acquired the sole right of confirmation and institution, to the exclusion of metropolitans and provincials to whom it belonged by ancient precedent. On the other hand, no further mention was made of the Councils of Constance and Basle, which had established the superiority of Councils over Popes, or of the annates abolished by the Pragmatic Sanction, which were accordingly at once revived. Both the Parliament and University of Paris strenuously resisted this arbitrary measure, but their opposition was suppressed by the King, and by the Bull *Pastor Æternus* Leo X. in lofty and sonorous terms of condemnation abrogated the Pragmatic Sanction, and established the Concordat in its place. The struggle, indeed, continued for many years, and the execution of the Concordat was contested in detail both by civil and ecclesiastical corporations, but the growing power of the monarchy ensured its ultimate triumph. In a certain sense it may be said that the Concordat helped to make the French episcopate more national, that is, more anti-Papal, but only by making the bishops more entirely the creatures of the Court. They were still less ready to assert the rights of their order against the Crown than against the Pope; and when, as frequently happened, Pope and Crown had a common interest, they were reduced to hopeless servility. But while nothing could be more strikingly opposed to primitive institutions than the state of things thus introduced, there was just enough semblance of national protest against certain Roman usurpations to operate as a veil to the true character of the measure, and enable its admirers to describe it plausibly as protecting Gallican liberties. It was in truth the system under which such men as Dubois, Tencin, Lafléau, and De Rohan rose to the highest dignities of the Church, under which the Jansenists and Huguenots alike were ruthlessly persecuted, and the disastrous Bull *Unigenitus* enforced with the whole weight of the civil power and with a rigour which, as the event proved, shook the very foundations of authority both in Church and State. If an ecclesiastical obnoxious to Rome, like De Marca, was nominated to the episcopate, the Pope had the absolute right of refusing institution till he had submitted. For several years under Louis XIV. thirty-five sees were kept vacant, in order to compel the prelates he had named to abjure the Four Gallican Articles, till at length both the King and his nominees yielded to the pressure put upon them. It was again the Ultramontane yoke of the Concordat which led at the Revolution to the ultra-national and ill-organized reaction of the *Constitution Civile*, and that in its turn was suppressed by a new Concordat drawn on the same lines as the old one.

It will perhaps be asked whether we mean that Napoleon desired to exalt the power of Rome, and to this the answer must be both Yes and No. He had the discernment to perceive, what appears to have escaped the cognizance of M. Paul Bert, that religion is the natural ally, and not the natural enemy, of authority and social order; and he was resolved for the consolidation of his own supremacy, in a country where, as it was officially declared, "the Catholic religion is that of the great majority," to come to an understanding with the Pope. Certainly he desired to be himself independent of control from Rome or from any other quarter, but he had no desire that his Church should be so. And as he expected always to be able to keep the Pope under his thumb, by physical force or otherwise, there seemed no readier means of ruling absolutely, and at the same time in a seemly and respectable manner—appealing to the religious conscience, and not outraging it—over the actual Church than to make the Pope its absolute master. In such a bargain Rome, which can afford to watch and wait, is pretty sure sooner or later to gain the upper hand, and Napoleon was already beginning to discover this before his fall. And with him fell, not the Concordat, but the iron hand which had sought to wield it as an instrument of imperial despotism. Its first appearance had been the signal for a revived ultramontaniam both of theory and practice. And that tendency was strengthened as well by the autocratic grasp it secured to the Pope over the national episcopate, as by the tyrannical yoke of civil despotism over the national Church, which led clergy and laity alike to turn to Rome as the one harbour of refuge. Thenceforth, as in Germany under the Falk laws, the religious party became identified with the Ultramontane party. Men like De Maistre, Lamennais, and De Bonald gave literary expression to this revived Ultramontane enthusiasm, and the experience of the last half century has abundantly illustrated its predominance throughout the length and breadth of the French Church. It is true that Bonaparte appealed, when it suited his purpose, to the Gallican liberties and the Articles of 1682, but his practical interpretation of them was to make himself the absolute master of the Church, with the inevitable result of driving it, as it had never before been driven, into the arms of Rome. The series of events which led up to this conclusion cannot indeed justly be attributed to Gallicanism, properly so called, but to influences radically opposed to it. Still less

is it Gallicanism, but the directly opposite principle in the religious sphere, that will be furthered by the yet more drastic *régime* in Church matters which the present Government of France threatens to establish. And if there be any truth in the report to which we referred at the beginning of this paper, the reactionary impulse produced by what looks like an infatuated assault, not only on all ecclesiastical but all religious life, may extend far beyond the boundaries of France.

#### PERILS OF COUNTRY HOUSES.

THE thefts lately committed at Dunecht and Brynkinalt have done something more than supply the daily newspapers with thrilling poster headings; they have added a new charm, in death as well as in life, to the "sweet security of streets." We say thefts, because it is the most convenient class-name; but it seems to be agreed by the best authorities that body-snatching is not larceny. There is property in a grave, and presumably in a coffin, but not, it would appear, in what the coffin contains. This, however, is a technical dispute of limited interest. To the ordinary mind such a case as that of the Dunecht misdemeanour combines, it would appear, the attractions of theft and murder, to which the newspapers already referred to do not hesitate to add other fascinations. The heading "Theft of an Earl's Body" appears to imply a dim notion on the part of the ingenious reporter or sub-editor who is responsible for it, to the effect that holders of that rank in the peerage have bodies of a peculiar kind corporally distinguished from the bodies of commoners, and even, we presume, from those of viscounts on the one hand and marquesses on the other. Indeed it is quite probable that he would be much puzzled to distinguish between the strict propriety of such a phrase as an Earl's coronet and the absurdity of such a phrase as an Earl's body. Putting all these accidents of the cases aside, however, there remains a considerable amount of interest in both. Both have what has been called the *caso-lite* attraction—the interest of a tangle which has to be unravelled—and both have other elements which appeal to the imagination. As to the magnitude of the Brynkinalt robbery, lucrative crimes of that kind are indeed getting almost hackneyed. It will be necessary soon to add a fourth list to those which now open the columns of the *Times*, and to revive the convenient shorthand by which our forefathers used to designate the fortune of a bride or the personal property of a deceased millionaire thus:—

On the 5th instant the Earl of DASH of a jewel casket at Treburtle, Cornwall (30,000*l.*)

A second parenthesis might contain the amount of reward offered. The other crime (for it amply deserves that name, whatever may be its more specific legal designation) is fortunately not likely to be so common.

An attempt has been made to show that, if Lord Crawford had not been embalmed, his body could not have been stolen, which is certainly true as far as it goes, but which does not seem to be a very effectual moral to draw. A more obvious and more practical one would be to say that burying in vaults offers the strongest temptation to this sort of sacrilege. Yet, again, it is tolerably obvious that, if the reported omission of the iron door at the mouth of the crypt be a fact, the business of the tomb-breakers was made easier still. Such masonry as is described, if fitted with a door such as bankers' strong-rooms have, would be practically impregnable; but mere slabs of stone, resting in their places only by their own weight and a little mortar, could offer no very formidable resistance to besiegers who knew what they were about. As, however, nobody could reasonably have anticipated that such a crime would be committed, it is not surprising that precautions which suggest themselves easily enough after the fact were not taken before it. If, as may be hoped and believed, the idea of paying blackmail is steadily rejected by the family, we are not very likely to hear of imitations of the deed. Advocates of cremation will probably make the most of it; though, as cremation supposes the retaining of the ashes, and in a form which would make them eminently portable property, not much would in reality be gained, for the columbaria which held the urns would be just as easily violated as the Dunecht crypt. The ordinary churchyard, not retired from the ways of men, and the ordinary fashion of burial, which accepts the destiny of earth to earth, are probably the best safeguards against similar post-mortem inconveniences. Meanwhile, it is certain that everybody who has a lively imagination, a memory capable of lending itself to that imagination with some docility, and a vigorous interest in what is going on, will for some time be sure that any odd-looking bundle which met his eyes during the month of September contained the late Lord Crawford's remains. Already persons of such unerring vision that they can tell a mummy from the top of an omnibus have communicated their reminiscences to the ear of a grateful public, and others will assuredly do the like if fate and newspaper editors permit. There are large numbers of people who appear to feel a certain pleasure in talking of graves, and to them Lord Crawford's misfortune must be an unmixed boon. To some other people it will probably be chiefly memorable as a fresh instance of the apparently incurable want of decency which the multiplication of newspapers has inflicted on this age. The fact is, of course, striking, and could hardly be concealed. But what business the average newspaper reader has with "the impression made by the head and shoulders of the deceased on the carefully-prepared

sawdust," with the wishes of a widow as to the spot selected for her husband's last resting-place, and with other matters less suitable still for publication, we at least cannot see. "My people loves to have it so" is, we presume, the excuse—a sufficiently feeble one.

If the advantages of churchyards over stately but lonely vaults in parks, and the necessity of making vaults secure, if they are made at all, are the subjects of the chief reflections which anybody has any business to make on the Dunecht matter, it is not so in reference to the more cheerful subject of Lord Trevor's loss. We speak, of course, from our own point of view, for it is not certain that the subject is a cheerful one to the bear of several thousand pounds' worth of jewelry. Here everybody may be said to have an interest; for though everybody has not got several thousand pounds' worth of jewelry, everybody is proportionately exposed to a similar loss. Besides, it may plausibly be contended that details ought to be published in order to prevent innocent and guileless people from buying diamond tiaras which happen to be offered them at a cheap price, and so defeating the ends of justice. There is really something interesting (putting questions of morality aside) in a "good" robbery, and this interest is entirely free from the morbid elements which enter into curiosity about murder, and, we may add, about violations of the sanctity of the grave. A good burglary or robbery from a house, even without infraction, requires very careful planning and the display of much ingenious generalship. Hitherto it seems doubtful whether this ingenuity was displayed at Brynkinalt. On the face of it, the hanging of a rope out of the window, which was obviously insufficient to support a man, which left a twenty-foot drop to the ground, and which would have landed the rather enterprising dropper on a flower-bed where his traces must have been seen, does not look artistic. Nor can the plan of leaving the key of a door, through which exit had apparently been made, under a dining-room sofa, be commended in itself. But it must be remembered that in the art of burglary more, perhaps, than in any other, *celare artem* is the great thing, and an apparent clumsiness may sometimes have the best effects in drawing the hounds off the scent. An inference, however, which supports that drawn from the rope and the key is undoubtedly given by the authoritative announcement that the jewels were not, as has been said, carelessly left in an open wardrobe, but were securely locked in a case built into the wall. Such being the fact, it is not uncharitable to say that correspondence with some one who was, or had been, an inmate of the house must have been indispensable to the thieves. The theory that the booty is even now concealed somewhere in the park at Brynkinalt does not seem to have much to recommend it, except the attractiveness of the general idea. A large park, traversed by a river, and thickly wooded, is an easy place to get out of to those who have taken the trouble to study its topography, and there never is much difficulty in studying the topography of a place like Brynkinalt. On the other hand, if what is called in Arctic travelling a *cache* of the jewelry has been made, it might remain concealed for an indefinite period, for it does not always happen that even he who hides can find in such cases. A park with some thousand pounds' worth of jewelry concealed somewhere about it would be unique among demesnes.

Both these incidents seem to show that of all precautions which people of considerable fortune, who have large houses and valuable property in them, can take, the most indispensable (and we think we are safe in saying the least generally observed) is the appointment of a perambulating watchman. Malefactors of all kinds very easily get to know the arrangements of a house, and the hours at which the various classes of servants are engaged or not on their respective duties. There are long hours during the day, and of course much longer hours during the night, in which it is a mere chance whether anybody entering or descending by a window, rummaging in a room, or even engaged in abnormal operations on an outbuilding like the Dunecht chapel, would necessarily be noticed. The house servants have their regular times of attending to their respective departments, and their regular times for absence from the regions they control. Gardeners (who, in a fashion, do perform an irregular kind of outpost duty) are not always at work; grooms and stablemen, by the very architectural arrangements of most houses, are out of the way, even if they did not generally entertain a profound belief that no animal possessing less than four legs deserves their attention; gamekeepers' operations lie too far from the house, as a rule; and a house porter is naturally not of much use, unless the enemy politely makes his approaches by the front door. If the great country houses of England were examined systematically, we imagine that not many would be found (though there undoubtedly are some) where there is anything like a regular day watchman, even if there is a night one. Accordingly, while robberies in town are generally committed at night, those in the country are at least as often, if not more often, committed in broad daylight; either—as in this case—during church-time, or during dinner-time in the summer, or at some other period which involves a regular and well-ascertained alteration of domestic habits. It is true, of course, that a watchman's perambulations might be in their turn watched. But few houses are so large that the rounds would give opportunity for entrance or escape without at least a great chance of detection, while such operations as that which must necessarily have taken place at Dunecht would be simply impossible. Slabs of stone weighing many hundredweight are not removed, even if they are unencumbered, in a minute, or in a few minutes. Consider-

ing the immense value of the property which many English country houses contain, and the comparative ease with which a thief can get off if he once clears the open circle of lawn and garden, a little more pains in guarding them than is generally taken would certainly seem to be desirable.

#### THE NORTH BORNEO COMPANY.

WITH a tardiness which is somewhat remarkable, public attention has at last been generally directed to a recent transaction which promises to be of some importance in our colonial affairs. The incorporation by Royal Charter of a North Borneo Company, which proposes to take upon itself the government of a territory considerably bigger than the United Kingdom, may very conceivably be the beginning of much. The Company may die a premature death, and nothing more be heard about it; but even if it fails to gain permanent success, it may live long enough to compromise the nation. The names which appear on the list of Directors of the Provisional Association to which the charter has been granted are a guarantee that the Company is to be organized for a serious purpose. That purpose entails the establishment of English factories throughout the territory which the British North Borneo Company is to rule with all but nominal sovereign power. Should the Company become bankrupt, it is scarcely conceivable that these settlements could be deserted, and so a permanent addition, which may be of great value, but may also only prove a source of expense, will be made to our colonial possessions. The Company nominally holds its sovereign rights as delegated on certain conditions, from the Sultans of Brunei and Sooloo; but it can only accept them for the Crown, and the Crown is therefore practically responsible for the Company, at least in so far as it is a governing body. It is worth while looking into the history and nature of a corporation which may compel much attention further on.

The process of the formation of the British North Borneo Company is a familiar one enough in the history of European settlement in the East. A British subject, Mr. Alfred Dent, by means of which we know nothing, gains from certain barbarous potentates a delegation of their sovereign claims over certain territories. He then proposes to utilize the concession by the formation of a Company, which is to work these territories as private property. The territories in question are to be held from the Sultan of Brunei, the Pangeran Tamongong, who, it seems, is his chief Minister, and from the Sultan of Sooloo. The first of these cedes his rights in three separate deeds, referring to different districts; the other two in one each. It is worthy of observation that the Sultans of Brunei and Sooloo cede rights over the same territory, and that the Pangeran Tamongong sells his right of private property in a district of which the sovereignty has already been ceded by the Sultan of Brunei, who also distinguishes clearly between what he sells as his personal estate and what as country over which he has only a right of supremacy. What the Sultan of Brunei, who would appear to include the other two, sells to his "trustworthy and well-beloved friends, the grantees," is "certain portions of the dominions owned by him, comprising the entire northern portion of the Island of Borneo, from the Sulaman River on the west coast of Mludu Bay, and to the river Paitan, and thence the entire eastern coast as far as the Sibuco River, comprising the States of Paitan, Sugut, Bangaya, Labuk, Sandakan, Kina Batangan, and Mumiang, and other lands as far as the Sibuco River; furthermore, the provinces of Kimanis and Benoni, the province of Pappar, and the territory of Gaya Bay and Sapangar Bay, with all the land and islands belonging thereto, and likewise the island of Banquay." Over these dominions—some hundreds of miles of coast in all—the Sultan of Brunei cedes his whole rights of sovereignty to the duly authorized representative of the British North Borneo Company, who is to govern them, under the title of Maharajah of Sabah (North Borneo) and Rajah of Gaya and Sandakan. The cession is made for "certain considerations"—namely, for a rent of twelve thousand dollars a year to the Sultan of Brunei, three thousand to his chief Minister—whom the Company promises to "protect with kindness"—and five thousand to the Sultan of Sooloo—in all, twenty thousand dollars, or some four thousand pounds. These concessions were originally made to Mr. Alfred Dent personally. The Provisional Association was formed to act as an intermediary between him and the Company to be incorporated; and now the Royal Charter asked for has been granted. From this document it is clear that the British Government is to assume the virtual, though indirect, sovereignty over all the territories to be taken in hand by the Company about to be formed. The suzerainty of the Sultans is indeed recognized, but only as far as concerns their right to the due payment of their trifling rents. Most of the other articles of the Charter are worded so as to secure at least the indirect control of the British Government over the proceedings of the Company. Apart from those stipulations as to the suppression of slavery and good treatment of the natives which could scarcely be absent, the action of the Company is subjected in various ways to the control of the Secretary of State. The appointment of the Company's representative is to be subject to his approval; it can make no transfer of its grants or commissions, or have dealings with foreign Powers except with his consent; and he is to be the judge of all disputes between it and the Sultans. The Secretary of State—in other words, the British Government—

is to have the supreme authority over all the doings of the Company, and must therefore, in the last resort, be responsible for it.

In estimating the probable consequences of the granting of this charter, the main thing to be considered is what the Sultans really have ceded to Mr. Dent. Looking merely at the data supplied to us by the preamble of the Charter itself, it would not seem to be anything considerable. It is not to be believed that rights of any real value over such large territories would be bartered even in Borneo for the sum of four thousand pounds a year to be divided among three persons. The Sultans of Brunei and Sooloo, if they were virtually rulers of these countries, would not reduce themselves to the condition of the most helpless of Indian protected princes for so trifling a consideration. The rights which can be so lightly parted with must be of a very nominal kind. This appears plainly from the preamble of the charter, but it is otherwise notorious. The sovereign rights of the Sultan of Sooloo are scarcely even nominal. Such as they are, he has already ceded them to Spain, in consequence of one of the obscure little wars which are chronic in the Spanish Philippine colonies. They probably amounted in practice to no more than a traditional claim to tribute whenever he was strong enough to enforce payment of it. The country over which he really rules is a group of islands to the North-East of Borneo. Whoever takes his rights takes simply a species of pirate kingship which will be effectual or not according to the fighting power of the holder. The position of the Sultan of Brunei is essentially similar. To the greater part of his nominal kingdom he holds very much the relation which the later Sultans at Delhi held to Oudh or Bengal. They had a right of giving an investiture, which was worth paying for when it could not be extorted by force. It would seem, therefore, that what Mr. Dent, or the Company which is to take over Mr. Dent's rights, really has acquired is the power to hunt, to kill, and to skin the bear, if it is able. The North Borneo Company will take the position of the Sultan as the holder of certain more or less indefinite rights of sovereignty, which must be made effectual by force of arms. The example of Rajah Brooke of Sarawak is there to show how worthless any investiture the Company may receive from the Sultan of Brunei will be if they cannot make it good by force. It is not to be supposed that the Directors of the Company have any settled scheme of conquest; but the whole history of European settlement in the East goes to show that conquest must be the result of their establishment in Borneo. Factories must be set up among savage or semi-savage tribes in a permanent state of hostility to one another, and not likely to submit without resistance to the exercise by total aliens of a more effectual control than has hitherto been enforced by the Sultans. The savage character of Dyaks and Malays is well known; and the Borneo of Chinese descent have long been organized in societies to defend their own interests, and are perfectly ready to fight for them. The factories will have to be made safe by the establishment of an armed force. Quarrels will certainly arise with the native chiefs, and, as a universal experience shows, can only end by European conquest. Trade will open the way for the foundation of an Empire, as it has always done since Europeans first made their way into the East.

Nor will the relations of the Company be confined to the Sultans and the various tribes. The sixth article of the Charter, which provides that "the dealings of the Company with any foreign Power" shall be subject to the control of the English Government, shows that the possibility of such relations arising is already contemplated. And before the Company is yet well in existence, it has been the object of attention and even diplomatic action on the part of Holland and Spain. The relations of the Company with Spain are likely to be very slight. That country is scarcely able to manage the Philippines, and its interests in Borneo are nearly null; its rights, too, to interfere are of the most shadowy kind. But the case is different with Holland. The Dutch have been left behind in the development of European Powers, but they have a great colonial empire in the Indian Ocean, and one that is still growing. They already have a settlement in the south of Borneo, and have established a protectorate over several of the southern princes. In 1847 the English Government found it necessary to put a stop to a further extension of their power in the island by a treaty with the Sultan of Brunei, binding that sovereign not to cede more territory to any European Power except England. It is true that the Dutch do not appear inclined to oppose the establishment of the Company's proposed rule in North Borneo in any way. We even hear of proposals to come to an arrangement as to the respective spheres of the Company's action and their own. That is to say, the North Borneo Company and the Dutch are to come to an understanding as to how much of the island each of them is to be considered entitled to conquer. Everything points to conquest as the ultimate result of the action of the Company. It is certainly a remarkable piece of inconsistency that a scheme of this nature should be approved by a Ministry which has made such unseemly haste to surrender already acquired territory in the Transvaal, and to sacrifice the interests of British subjects for the sake of peace and an escape from responsibility. The establishment of an English Government in North Borneo would doubtless be a benefit to all concerned. The natives would gain by the control of a civilized authority. Their prosperity, as well as our commercial interests, would be served by the peaceful and intelligent development of the great natural resources of Borneo. Nevertheless, it is strange to find a

scheme for doing this by an extension of our colonial empire promoted by a Ministry which has the happiness to include among its members Messrs. Bright, Chamberlain, and Courtney. And, apart from the strangeness that such men should do such a thing, we think exception may be taken to the way in which it is proposed to be done. The example, not only of the East India Company, but of the Company established to colonize New Zealand, proves that the Imperial Government cannot tolerate the prolonged existence of corporations exercising sovereign powers abroad. If we are to take North Borneo into our hands, it would be better to follow the precedent of Fiji, and do so by the direct action of the Crown. To develop the resources of North Borneo by a trading Company under the protection of a Colonial Government is one thing. To bring into existence a corporation exercising sovereign powers, maintaining its own fleet and army, making its own little wars under the indirect control of the Imperial Government, which is ultimately responsible for it, is quite another. If it were likely that the corporation could enter at once into the peaceful government of the territory ceded to it, the reasons against establishing it would still be strong. They are doubled in strength by the probability that it can only make its rule a reality by a series of little wars which would endanger it financially and complicate its relations to the Home Government. The nation would in the long run have to take up the task of settling the country; for it is to be presumed that not even the Ministry who surrendered the Transvaal could allow a Company established with its consent to be destroyed, and its agents slaughtered by Dyaks and Malays.

#### SALE OF THE SUNDERLAND LIBRARY.

THE first days of the sale of the Sunderland Library have surpassed all expectation. This sale was particularly interesting, because it was certain to show, beyond possibility of error, the direction in which the tide of fashion is setting. We confess that the appearance of the books, huddled together on the dingy shelves of the sale-room, did not impress us very favourably. The Library has not always been carefully watched. Many of the books were ill bound originally, and the calf-leather or vellum covers had grown seedy by lapse of time. The interiors were, on the other hand, clean and well preserved. Some very valuable books, it is true, had lost leaves here and there, and miniatures had been cut out of some MSS., while the cruel plough of the binder had defaced the fair margins of others, and others, again, were water-stained. Still, these were the exceptions; and, as a rule, the margins and condition generally were highly respectable. It seemed certain that no fictitious value would be given to the books by rare old bindings and the arms of the famous collectors of the past. The question arose, Would modern taste applaud that of the old Earl of Sunderland, and endorse his judgment, by bidding great prices for books which he may have bought comparatively cheap? On this subject, too, we had doubts. Classical books are no longer read, and we hardly anticipated the prices that were to be paid for certain early printed volumes. The collection is necessarily deficient in almost all the newer varieties of fashionable literature. The vignettes of the later eighteenth century, the books of the Romantic school, original editions of Shelley and Keats, and other modern poets, one could not expect to find in the Sunderland Library. It seemed certain, however, that early editions of the modern European classics, as Dante, Ariosto, Boccaccio, were well represented; and, as the Earl of Sunderland collected some of the poets of the Pleiad, and possessed original editions of plays by Boursault, later volumes of the catalogue may prove that he did not neglect Ronsard, Villon, the *Romances of the Rose*, Corneille, Molière, and Racine. He was also rich in Americana, which are now so greedily sought by Transatlantic purchasers.

If it be true that sums like 25,000*l.* were offered for the collection as a whole, dealers must have either underrated its value or supposed that "holders" were very anxious to "part." Up to the present moment each day's sale has averaged, we think, about 2,000*l.*, Wednesday's sale alone exceeding 4,000*l.* At this rate the first twelve days' buying and selling, which only take us as far as the esteemed works of Ohappuzeau and Ohardin, will produce a sum equal to that said to have been offered for the whole library. It is reported that the Americans were particularly anxious to purchase the collection *en bloc*. We cannot be expected, after all their recent sporting victories, and their acquisition of the Cesnola Cyprian collection, to grieve at their disappointment. Mr. Quaritch spoke to these enemies in the gate, and also faced the French champions with much firmness, though M. Techener occasionally overcame his stubborn resistance. It is impossible to say how many days the sale of the whole collection will cover. Estimating the letters from A to OHA as covering a fifth of the whole contents of the library, there still remain about fifty days of the delight of battle. We can scarcely expect any other books to equal in price the famous Boccaccio's Bibles, and the St. Augustine, but perhaps 100,000*l.* may be regarded as a moderate estimate of the value of the library. So excellent an investment are books, if people buy the right books. We are obliged to take this commercial view, because it is impossible to suppose that many purchasers will look on their treasures as literature. Anacreon is more easily read in a Tauchnitz edition ("cost you a shilling," as Pepys would have said) than in the original edition of Stephanus, and the Mazarine Bible is more inconvenient to

study than an inexpensive copy from what the *Times* calls "The Caledonian," and mortals call the Clarendon Press.

We may look at a few examples of the prices brought by separate books, as illustrative of the tendency of modern taste, and of the abundance of modern wealth. The poems of Soudéry, with *Les Chevelles* (1649), seem rather dear at ten guineas. The first edition of Æschylus, on the other hand, the Aldine edition of 1518, is a bargain at 4*l.* 7*s.* 6*d.* M. Techener carried off De Albertini's *De Mirabilibus Rerum* (1510), printed on vellum, for 66*l.* The same champion overthrew Mr. Quaritch in a spirited contest for the grammatical works of Alexander Gallus, a volume that rejoices in painted initial letters (41*l.*) *Amadis de Gaule* was in a state of unknighly seediness—the first edition, indeed, but cut, and patched, and clouted. One adventurous spirit bid 10*l.*, and no one contested his possession of this treasure. Americana, of course, caused wild biddings. The *Libro Ultimo de le Indis Occidentales* is a tiny volume in vellum, which fetched 47*l.* "A true Declaration of the State of Virginia" (1610), with other tracts, the original value perhaps about one shilling and sixpence, was bought by Mr. Quaritch for 143*l.*, and some New England tracts fetched 111*l.* The first edition of Anacreon (1554), printed on vellum, was the first book that produced a really exciting contest. France, in the person of M. Techener, fought hard for this masterpiece of Henri Etienne. The binding bears a cardinal's hat; but Brunet, for reasons which are not apparent, believed the book to have been in the possession of Grolier. Mr. Quaritch secured this jewel for 221*l.* Libri possessed a fine copy of this book on paper; it had belonged to Daniel Heinsius, and contained seventy-six pages of manuscript in his hand. Libri's copy sold in 1859 for 1*l.* 6*s.* The Sunderland Library copy on paper, on the other hand, brought 10*l.* 10*s.*; and Remy Belleau's translation fetched 20*l.* 5*s.* Remy Belleau is the poet whom Queen Mary, in Mr. Swinburne's new tragedy, prefers to her forgotten Chastelard. The first edition of the *Greek Anthology* (Lascarius, Florence, 1494) sold for 51*l.*; while the Aldine edition (Venice, 1503) brought but 4*l.* Alopa's Apollonius Rhodius (Florence, 1496), printed on vellum, was sold for 160*l.* to M. Techener. If the Sunderland Library contains the first Florentine Homer on vellum there will be a battle for that beautiful book worthy of the song of Homer himself. The first edition of Apuleius, printed at Rome by Sweynheym and Pannartz (1469), seems cheap, as prices go, at 64*l.* M. Techener outbid Mr. Quaritch for a book that should have stayed in England—a book that bore the autograph of William Cecil, Queen Elizabeth's secretary. This was the first edition of the *Orlande Furioso* (Ferrara, 1516). The sum of 300*l.* won this desirable volume for some purchaser in France. The greatest of all contests hitherto has been that for the Augustine on vellum (Jenson, 1475). This book has miniatures of fanciful beauty; for example, a hart wounded by two cupids, and St. Augustine in meditation. M. Techener and Mr. Ellis competed till 400*l.* was reached, when Mr. Quaritch took up the bidding, and the Frenchman and he went on till 980*l.* was attained. Here there was a pause, and it seemed as if the countrymen of Gladiateur were sure to carry away the St. Augustine. But the English representative advanced to 1,000*l.*, which is twenty-five thousand francs, and beyond that bid M. Techener did not care to go. He consoled himself with a rather damaged Augustine, printed on vellum in 1470. A beautiful MS. copy of the *Roman du Roi Artus* remained in England, being ransomed for 535*l.* The illuminations were of the utmost originality and ingenuity. Oreamer's old translation of Aristotle's *Politics* (1489) seemed very cheap at 6*l.*, after all these great prices.

Next day some of the works of the French Pleiad were sold. *Les Jeux*, of Baif, fetching 17*l.* Henri III., and books of his reign, are much in fashion. The *Ballet Comique de la Royne*, of Beaujoyeux, valet de chambre au Roy, brought 125*l.*, and M. Morgand could not win it for France. A book by Bejart, one of Molière's troupe, and brother-in-law of the poet, seems to have attracted no attention. Some original pieces of Joachim du Bellay fetched 40*l.*, and the Rouen edition of 1597 sold for 30*l.*, though we have purchased a copy of the same for as many shillings. The binding was not rich or rare, but was stamped with two M's, possibly the monograph of Marie de Medicis. A rare book with De Thou's arms fetched 41*l.* At the time of Libri's sale De Thou's bees were not nearly so much valued. The great book of the sale was "the first Bible printed with a date" at Mainz, in 1462. The French do not seem to care for Bibles so much as the Bible-loving English. Those eminent devotees, Mr. Ellis and Mr. Quaritch, carried their pious enthusiasm to the extent of 1,600*l.*, for which sum the latter bore away "the secret of England's greatness." Among other Bibles, a most gorgeous family Bible, with enormously thick old morocco covers, lined with gilt paper, clasped with prodigious silver clasps, and printed on vellum (Oxford, 1717), fetched 225*l.* The possession of this work should at once transform a manufacturing into a county family. It looks like a kind of Palladium, and is a perfectly magnificent example of English piety, adorned and illustrated by English taste. A book which puzzles us is the poetry of Blanchon, Joachim Blanchon (1583), with a portrait of Henry III. We know something of the bards of that date, but Blanchon has escaped the historians of literature even more successfully than Jean Chaperon or Scallion de Virblunneau. Blanchon's verses were sold for 41*l.*, as much as Mr. Ruskin's volume of poetry brings at auction. A French translation from Boccaccio (Bruges, Colard Mansion, 1475) nearly reached 1,000*l.*, but stopped at 920*l.*, remaining in England.

Finally, the great Valdarfer Boccaccio, the tallest in the world, fetched 585l.—not a great price, but the volume might be in better condition. The moral of the sale is that poor collectors can scarcely hope for really good books in this age of long purses. They must be content with the Elzevirian crumbs which the Earl of Sunderland seems to have neglected.

#### THE STRIKE IN THE POTTERIES.

THE strike in the Staffordshire Potteries has some features of more than usual interest. The expedient which has often been recommended as an infallible preventive of trade quarrels has been in operation in the district for the last fourteen years. In 1867 the masters and workmen agreed to set up a Board of Arbitration, and until Michaelmas last the rate of wages continued to be governed by its decisions. The present dispute dates in some sort as far back as 1876. In that year the employers appealed to the Board for a reduction of wages. The terms on which the men were then working had been fixed in 1872. At that time trade was exceedingly brisk in the Potteries, as in most other places, and the workmen found little difficulty in getting a rise of ten per cent. over the wages they had up to that time been receiving. Between 1872 and 1876 English trade had undergone a very serious reverse, and the employers were able to lay a strong case before the Board of Arbitration. There was less demand, they said, for their goods at home, and less power of disposing of them in foreign markets. The introduction of protective tariffs had greatly crippled the trade with the Continent and America. England could undersell the foreign producer if she were allowed to put her wares into the market at rates proportionate to the cost of production; but when to that was added the duties which had to be paid on them under the tariff, she found herself undersold by the native producer. On this first occasion, however, the application was unsuccessful. The Board of Arbitration could not be brought to see that it was expedient to make a general reduction in wages, and they remained at their old rate for three years longer. In November 1879 the masters renewed their application, and this time they got what they wanted. Lord Hatherton, who had been chosen as the arbitrator, compared the state in which the trade had been in 1872 with the state to which it had been reduced in 1879, and decided that a reduction of a penny in the shilling would best meet the case. Accordingly, from November 1879 to November 1881 those were the wages paid. The reduction had been acquiesced in by the men, but so unwillingly as to make it certain that they would reopen the question at the very first opportunity. In November of last year the rate of wages was submitted, on behalf of the workmen, to the arbitration of Sir Thomas Brassey; and, according to the correspondent of the *Daily News*, from whose narrative we borrow these facts, Sir Thomas described the "battle of arguments and figures" as one of the "most remarkable exhibitions of working-class intelligence and of almost paternal relations between employers and workmen" that he had ever witnessed. Sir Thomas Brassey decided to sustain Lord Hatherton's award. The workmen greatly resented this decision, but no immediate action was taken in opposition to it. It proved fatal, however, to the Board of Arbitration. Notices of withdrawal from the agreement to be bound by its decisions became common; and, as a Board of Arbitration is useless if its awards are not to be universally accepted, it was dissolved. At the beginning of the trade year the demand for a rise of wages was renewed; and, on its refusal, four weeks ago, some 20,000 people ceased to work.

It is seldom that in a strike of this magnitude the right is so entirely on one side. In the majority of trade disputes the refusal to submit the case to arbitration has come from the masters; and we are very far from saying that in all cases such refusals have been without justification. The masters have often contended that the points in dispute were not such as they could possibly refer to any decision but their own. It is evident that the question whether wages ought to be raised may depend on considerations which have only a remote connexion with the state of trade at the moment when arbitration is proposed. The employers, for example, may have been working for some time for very inadequate profits, and they may only have been induced to go on doing this by the hope of better times to come. In theory wages and prices depend on one another; but an employer will sometimes prefer to go on paying the same wages after prices have fallen rather than run the risk of a strike and the disturbance of trade that would ensue from lowering them. If this has happened pretty often in the course of a few years, the employer will naturally look forward to a rise of prices, not merely as to a time when he may do a better trade than formerly, but as to a time when he may recoup himself for the losses incurred when times were bad. It is easy to see how, under such circumstances as these, masters may get wrong with their workmen. The workmen see that trade has improved, that orders come in more briskly, and that higher prices are asked and obtained; and they infer that the profits made by the masters must be such as to justify an immediate rise of wages. They would be large enough to do this, the masters reply, if wages had always been reduced in proportion to profits; but, inasmuch as this was not the case, we cannot afford to raise wages until the losses incurred on the inadequate profits realized by reason of their not being reduced have been made up. This is not an issue that readily lends itself to

arbitration. The arbitrator can but say that the employer is earning so much now as against so much which he was earning a year ago. He cannot determine how long the employer must go on earning this increased sum before he will have made that aggregate profit, without which in the long run it would not be worth his while to keep his works open. That is a point upon which every man must judge for himself, and it is the sense that this must be so that has so often led employers to reject proposals of arbitration. Still it is always matter for regret when they are so rejected, because it presents the masters in an attitude of, to say the least, apparent want of confidence in the goodness of their own cause. There will always be a presumption, though in this instance it is often an unfounded one, that the man who will not submit his case to the unprejudiced judgment of a third person has a secret suspicion that he may be proved in the wrong. Employers who refuse arbitration may sometimes, of course, be actuated by this feeling; but it will be found, we suspect, at least as often that what they fear is that their case will be upset on paper without the strength of its appeal to their pockets being in the least diminished.

In the strike in the Potteries the refusal to submit to arbitration has come from the other side, and, moreover, it has come after a long course of years during which the system of referring all disputes about wages to arbitration has been completely successful. It is surprising that before breaking away from this system the men should not have considered that whatever indisposition has hitherto been felt to arbitration has almost invariably been on the side of the masters. The grounds on which the workmen demand a rise of wages are usually extremely simple. They allege that trade is brisker, that there is more money coming in to the masters, and consequently more to be paid out to the workmen. The grounds on which the employers resist a rise of wages may, as we have seen, be of a much more recondite kind. Much may depend on the skill with which they are put before the arbitrator, and the masters may distrust their own ability or that of their representative to put their case in the really effective light in which, if properly handled, they believe that it might be put. It is a genuine victory for the men, therefore, to have got arbitration formally established as the universal method of deciding disputes about wages. If occasionally wages are reduced under this system when they would be maintained without it, the occasions on which they are raised or maintained under arbitration when they would remain as they are or be lowered without arbitration are much more numerous. In the case of the Potteries the masters failed to get a reduction for three years of trade depression, while the men have as yet only gone without a rise of wages for two years of trade revival. It seems like madness, therefore, when the disputant who in the long run has by far the most to hope for from arbitration is the first to reject arbitration on the solitary ground that the award has gone against him in two instances. Even supposing that Sir Thomas Brassey's award was mistaken, and that the improvement which trade had undergone in 1880 was really sufficient to justify an advance in wages, it would have been infinitely more to the men's interest to have acquiesced in it than to have thrown the whole plan of arbitration overboard, and fallen back upon the old brutal method of refusing to work, and living on the accumulations stored up in years when they were more wisely disposed. The four weeks for which the strike has already lasted will have consumed an amount of reserve funds which it will take them a long time to replace, even if they ultimately get the advance they have asked for; while, whether they get it or not, they will probably begin work again with a suppressed ill-feeling on both sides, which will no longer have a Board of Arbitration to prevent it from coming to a head.

#### CAPTAIN AND PASSENGERS.

AN attempt, which we trust may prove successful, has recently been made to enable people to enjoy all the pleasures of an extensive yachting trip without any very great expenditure. Lady Brassey's book showed what an extremely agreeable thing a voyage round the world may be; and it apparently occurred to the managers of an enterprising Company that, though there are but very few persons who are in a position to imitate Sir T. Brassey, there are a good many who have sufficient leisure for a long voyage, and sufficient means to pay for comfort afloat. A vessel was accordingly prepared for carrying a certain number of passengers round the world, touching at such "places of interest" as are to be found on the various seaboard of what an American has called this one-horse planet, and she sailed for the East some six weeks ago. How much enjoyment may be derived from such a voyage as this vessel is making is obvious; but it is also unfortunately obvious that that enjoyment may be sorely marred unless there is something like harmony among the fellow-travellers; for squabbles which would be nothing ashore are very serious matters when people are boxed up together for nine months. The best safeguard against the discomfort which may be caused by such feuds is, of course, the authority of the captain, who is to some extent ruler and peacemaker, and who, if he has good sense and good judgment, will generally succeed in effecting what is known in duelling cases as "a peaceful settlement." In some instances, however, the captain may have to do more than conciliate and advise; he may have to exercise his authority; and it is generally supposed that the captain of the steamer we have mentioned has been

armed with exceptional powers for the purpose of putting a stop to misconduct which may interfere with the general comfort. Whether such powers are legal may perhaps be doubted, and certainly the expediency of conferring them may be doubted. The remedy may prove worse than the disease, and over-strict rule be found much more trying than unpleasant companionship. Some power, however, a captain clearly must have, and the precise extent of his authority over passengers under the law as it is, without any special stipulation, is a question of great importance which will be of interest to many besides those who are obliged to traverse the seas, if the voyage we have spoken of proves successful. An opportune moment for discoursing on this subject has, then, been chosen by Sir Travers Twiss, who contributes to the current number of the *Nautical Magazine* an article on "The Master's Authority over Passengers at Sea." As the law on this subject has the rare merit of being simple, and as it is but little understood, his brief and lucid exposition of it should receive the attention of those who have to make long ocean passages, of those who think of making voyages for amusement's sake, and especially of the masters of passenger ships engaged in the foreign trade. The authority of masters of vessels engaged in the home trade it is not necessary to consider, as this is clearly defined by statute.

In one respect the law on this important subject differs from the English law on most subjects, and approximately resembles the history of the nation which is supposed to be happy. There is very little of it. Indeed, so far as the Admiralty Courts go, there is next to none of it. Sir Travers Twiss shows that in 1802 Lord Stowell, after some hesitation, allowed a civil suit to be instituted by a passenger against the master of a ship for assault. The case, however, was not proceeded with; and since its institution there is, says Sir Travers, "no reported instance of proceedings in the English Admiralty Court for damages on the part of a passenger against the master of a ship." In the Common Law Courts, however, there have been such proceedings; and from the reports of them a clear idea of the legal powers of the captain may be obtained. The cases—though not, we believe, quite so rare as Sir Travers Twiss thinks—are few in number; but happily the *dicta* of the judges are decisive, and, with one slight exception, consistent; and the law, as laid down by them, seems in accordance with reason and common sense. It does not support exaggerated views on either side. The passenger who looks upon the captain as being in much the same position as the manager of a hotel, and the captain who fondly imagines that he sits at the head of the cabin-table armed with despotic authority, are equally in the wrong. The needful powers are given to the master of a passenger ship, but he may get into a sad scrape if he abuses them, or if he acts under the impression that he has the same authority over the passengers that he has over the officers and crew. This fact was realized seventy-four years ago by a captain of an Indiaman, who, acting under considerable provocation, treated a passenger with unnecessary harshness. In *Boyce v. Bayliffe* (1 Camp. 57), cited by Sir Travers Twiss, the plaintiff sued the master of the *Huddart* for assault and false imprisonment on the voyage home from the East. It appeared that, in consequence of two strange sail being sighted, which were supposed to be enemies, the ship was cleared for action, and that the plaintiff was ordered to go with the other passengers on the poop, where they were to fight with small arms. The plaintiff, who was not a cuddy passenger, but in the gunner's mess, had previously been forbidden to walk on the poop by the captain, and he now refused to go there, though willing to fight in any other part of the ship. The captain put him in irons, and kept him on the poop all night in irons. At the beginning of the case Lord Ellenborough appeared to think that the captain was justified; but when it came out that the passenger had been kept on deck all night, he held that the defendant had clearly exceeded his authority. According to his view apparently the captain had the right to do what was necessary for the safety of the ship, and to assign stations to passengers. The plaintiff had refused to obey, and his confinement was, therefore, perhaps necessary; but, in punishing him as he had done, the master had gone too far. This case seems to show very accurately what the powers of a captain are in times of danger. The passengers must obey him implicitly, and, in case of disobedience, he may be justified in putting the offender in irons; but he must not behave vindictively to a man who has misconducted himself. He must not think that he is justified in punishing him in the same way as he would punish a mutinous officer or seaman. That this rule, which may be deduced from the dictum of the famous judge who, when not carried away by political prejudice, usually decided so well, is in accordance with justice and good sense, can hardly be doubted; but we fear that it is scarcely in accordance with the ideas which some captains have of their prerogative.

Fortunately, questions respecting the captain's power in times of actual danger to the vessel are not likely to arise often, as deliberate disobedience at such times will probably be always rare. Not unfrequently, however, a captain may have to stop wanton impertinence to himself, or to interfere when a passenger is behaving obnoxiously to his fellow-passengers; and it is important to know what legal power he has when a man persists in making himself disagreeable. On this point the law again seems moderate and sensible, and while giving the captain necessary authority, does not encourage any fantastic notion of his dignity. The first case quoted by Sir Travers Twiss is "*King v. Franklin*," 1 Foster and Finlason, 360, in which Baron Watson, after laying down—somewhat broadly perhaps—that the cap-

tain had absolute control over the passengers and crew, and speaking of his powers in case of emergency, went on to say, "If a passenger misconduct himself at table, the captain may remove him, or may even imprison him for a short time, if imprisonment be necessary for the enforcement of his lawful commands. The rule of law is simple; the power of the captain is limited to the necessity of the case." Here, perhaps, the learned Baron slightly overstated the law, as what he says scarcely seems in absolute accordance with what has been laid down by Chief Justice Tindal and Baron Channell in cases to which we shall shortly refer. No doubt, if a man gets drunk or uses disgusting language at table, the captain may deal with him sharply; but, on the other hand, he certainly must not try to raise himself into an *arbitrarius elegantiarum*, a nautical Nash, with even more than Nash's powers, and forcibly remove men from table or confine them in their cabins because he considers that their behaviour is coarse. Such men are terrible nuisances to their fellow-passengers; but, like other nuisances, they must be endured; and it would never do to allow a captain to constitute himself a judge of good manners. Indeed it would be manifestly absurd for him to arrogate such a position, seeing that on board a passenger steamer not a few of the passengers are frequently of much higher social status than the commander. In the case just mentioned the plaintiff told the captain that the ship was only a floating hotel, and he the landlord of it; whereupon the captain, in great wrath, had him "lightly ironed." Baron Watson was evidently much puzzled at the indignation which the expression caused, and said that it was not altogether incorrect. He further observed that the commander was certainly not justified in imprisoning a person for calling him the landlord of an hotel. In the case of *Prendergast v. Compton* (8 Carrington and Payne, 454), tried before Chief Justice Tindal in 1837, coarse conduct at table was given as sufficient reason for excluding a passenger from the cuddy or poop cabin for which he had paid his fare. This offending person had indeed conducted himself like the naughty boy of a nursery story. He helped himself to potatoes and broiled bones with his hands, and, as was gravely alleged in the plea, stretched out his hands and arms in front of people sitting at table by him. The judge laid down to the jury that "conduct unbecoming a gentleman" on the plaintiff's part might have justified the captain in excluding him, but that in this case there was "no imputation of the want of gentlemanly principle." Happily the judge thus made clear what he meant by the expression "conduct unbecoming a gentleman," which is perhaps the vaguest in the English language. He referred, not to vulgar or ill-bred conduct, but to discreditable conduct; and the inference from his judgment is that a captain is not justified in dealing despotically with an ill-bred passenger because his manners are offensive to the others. At first sight this may seem hard on people who have to sit at table with a fellow who is scarcely fit for the servants' hall; but a little consideration will show that much more harm would be done if the law went to the other extreme, and if the captain was entitled to put under arrest or turn out of the cabin any one who addressed him in a way which he considered impertinent or whose manners he disapproved of. A certain amount of necessary power a captain has, no doubt, but not nearly so much as has been imprudently claimed.

In a later case than those above mentioned—that of *Aldworth v. Stewart* (4 Foster and Finlason, 957)—to which, strange to say, Sir Travers Twiss does not refer, Baron Channell laid down that a captain's authority over his passengers was "based upon necessity, and was limited to the preservation of necessary discipline and the safety of the ship." To justify arrest on the ground of mutiny, "there must be some act calculated in the apprehension of a reasonable man to interfere with the safety of the ship or the due prosecution of the voyage." This dictum, coupled with the others to which we have referred, seems to show what a captain's authority over his passengers is with a clearness not often found in the English law. In time of danger he must be implicitly obeyed, and may put in irons a passenger who deliberately disobeys him. For the preservation of order among the passengers under ordinary circumstances he has authority, but it is strictly limited. He may put a stop to marked misconduct, or may silence language which is likely to cause a mutiny; but he must beware how he uses his power, and is not at all in the position of a colonel of a regiment or of the captain of a man-of-war. If he puts a passenger in irons or confines him to his cabin without really good cause, he renders himself personally liable to an action, and may have to pay very heavy damages. That his authority should be thus limited appears perfectly reasonable. Were the captains of passenger ships rendered more despotic by legislative enactment, those who have to make long voyages, or those who go on yachting trips round the world, might find that the annoyance caused by an unpleasant messemate is small when compared with the misery which may be inflicted by a tyrannical commander.

#### ST. KATHARINE'S DAY AT ST. KATHARINE'S HOSPITAL.

IN the gradual, and during recent years rapid, decay of local tradition, the honour in which St. Katharine, Virgin and Martyr, was once held throughout England is fast passing out of remembrance. The fear of School Boards or School District authorities, as represented by the ubiquitous Inspecting Officer,

identical usually with the "nuisance-man," has fallen on the children of the midland counties, and the voice of their song, as they were wont to go on their "Katharine and Clement" rounds, is heard no more in the land on dark days in the end of November. The kind old ladies who never failed to set aside the basket of "red apples" for the little petitioners are all gathered into family vaults, and only the learned in black-letter hagiology know or care that the 23rd and 25th of November—both in the Sarum Use Simple Feasts of the First Class, and marked by the Dominical Red which the long tradition of vestries believes to be the only orthodox colour for an altar-cloth—were kept in honour respectively of St. Clement and St. Katharine. Variations in the spelling of the name of the Alexandrian Martyr are of very long standing; but the true tradition of the initial has been preserved in the familiar English "Kate." The Missal gives "Catharina"; the Sarum Calendar, we think, "Catherine"; and the printers of the English Prayer-Book any spelling which occurs to them at the time; Mr. Blunt, in the *Annotated Book of Common Prayer*, restoring the ancient form. For the orthography of secular calendars we have turned in vain to several "Vox Stellarum" authorities of a century since. "Francis Moore, Physician," was a loyal Hanoverian, and displaced the black-letter St. Katharine to make way for the red-letter notice on November 25th, "Duke of Gloucester born"—the change of style notwithstanding, the Duke's birthday having been on the 14th. It is due to the venerable Foundation which for nearly seven centuries and a half has preserved the name and memory of St. Katharine "near the Tower" that it has at least maintained the traditional spelling, through all its vicissitudes of dignity, misfortune, and mismanagement, and has transmitted this inviolate to its assigns of the Dock Company. And it is pleasant to find that in the grotesque suburban exile of the Hospital among the Regent's Park villas the general decay of the national tradition of honour to its patron saint has been in some measure compensated by a special revival or commemoration, upon something like the ancient lines, of the mediæval Chapter of St. Katharine. On St. Katharine's Day in the present year a gathering of the members of the Foundation and its eleemosynaries was assembled in the singular group of buildings which express the ecclesiastical ideas of the Georgian age, and did at any rate show to the nation and the world the spectacle of a Religious House completely restored as regards its personal constitution, although the report of its proceedings may not be read altogether with the gravity which would befit the record of a dignified ecclesiastical function. Some little preparation of mind, and some sense of custom acquired by repetition of experience, is wanted before one can fully realize the idea of the middle ages tempered by tea and cake. But it will all come in time, and the St. Katharine's experiment of this year may be improved as years go on.

The central fact exhibited by the Regent's Park gathering on St. Katharine's Day is one now seen for the first time since the accession of Edward VI. The Chapter of St. Katharine's was present under the presidency of its clerical Master or Dean, and the appropriation of its revenues under a royal dispensation by a layman in attendance on the Court was, in spite of the prescription of more than three centuries, shown to be a thing of the past. With the Master, who has not as yet assumed, or been authorized to assume, the Decanal style which by analogy should attach to his office, and who is described by the simple prefix of "Reverend," are said to have been assembled "the resident Brothers and Sisters, the Extern Sisters, the Nurses of the Order of St. Katharine from the Westminster and other Hospitals," and also "some of the bedesmen and bedeswomen, with the boys and girls of the St. Katharine's School." "A special service was held in the chapel at three o'clock"; while later in the afternoon and evening the numbers present at the service were augmented by several old scholars, and the tea and cake portion of the arrangements succeeded in the usual way. The old scholars, it is added, "have recently been formed into a guild, meeting at St. Katharine's every month," an institution which is in harmony with the ancient precedents of the foundation, an associated guild of considerable importance having existed at the time when Katharine of Aragon was its patroness. The report from which we quote, and which appears to have been either contributed or inspired from an official source, is wound up by the instructive reflection that "such a gathering cannot fail . . . to increase a sense of gratitude in those who are recipients of the bounty which is dispensed to them by the favour of her Majesty, who is the patron of the Hospital"—a sentence not exactly framed upon mediæval models, but rather recalling to memory the genuine Hanoverian charity-sermon ring. This style was, no doubt, impressive in its time; but in its present reference to the revenues and benefices of an ecclesiastical foundation in Royal patronage it is suggestive after a fashion which its writer may not have contemplated. Her Majesty has recently selected as "recipients of her bounty" as patron of foundations of a character similar or cognate to St. Katharine's three gentlemen of acknowledged merit and attainments. It would be a curious, though scarcely a practicable, experiment to collect the newly appointed Deans of Westminster, Wells, and Carlisle, and, after causing them to sit in a row and regaling them with "a substantial tea," to watch their countenances for traces of the "increased sense of gratitude" with which, we must suppose, they ought to be illumined. The analogy is strictly accurate, since the Collegiate Church of St. Katharine near the Tower is just as much and as little a "charity" as is the sister Collegiate Church of St. Peter, Westminster.

From the details given in this report of the existing members and associates of St. Katharine's Hospital, it is evident, according to all the historical precedents, that new Rules and Orders, or, in modern language, a new scheme, have already been framed by the Lord Chancellor and are in force. The "Extern Sisters," and the "Nurses of the Order of St. Katharine" from the hospitals, are an addition to the old foundation, which consisted of the Master and resident Brothers and Sisters, with ten bedeswomen, and to the body as augmented in 1829 by Lord Lyndhurst, when the bedesmen and the schools were introduced. Of the appointment of "Extern Sisters," as far as we are aware, no particulars have as yet been publicly made known; but the institution of "Hospital Nurses" has been announced some time since. Both in their numbers and in the proportion which the emoluments paid, either directly to them or to the various hospitals on their behalf, bear to the value of the benefices of the Chapter, they seem exactly to represent the ten bedeswomen of the old Foundation; and their recognition and payment appear to involve the existence of Orders issued by Lord Cairns. There is no historical necessity that such Orders should have been enrolled in Chancery, and up to a recent date they had not been so enrolled. But it is matter for regret that their existence should remain doubtful, and that, if they do exist, they should not be made public. The opinion formerly current in some portions of society, that the foundation was one of a private nature, has been repeatedly shown to be incorrect, and its public character has been proved by the evidence of a mass of State papers, while no attempt to produce either arguments or evidence on the opposite side has ever been made. The Act of Parliament by which cathedrals and all the other collegiate foundations of the English Church have been re-arranged and reformed, contains an express provision for inquiry and reform in the case of foundations such as St. Katharine's, which is only not named because the reference was obvious, and because reasons, well understood at the time, made reticence and delay desirable; but it is known that these reasons have ceased, by lapse of time, to exist. The patronage is now, according to ancient charters and usage, exercised by the Sovereign, *vacante sede* of the true patroness, the Queen Consort, or Queen Dowager; and the administration of the Hospital, under either condition of patronage, has been carried on under Orders issued from time to time by the Lord Chancellor. But the directions contained in the Act above mentioned (3 & 4 Victoria, c. 113, s. 65) are specific, and any Orders of the Lord Chancellor must have been framed in accordance with them. If, "on inquiry, the Endowments of such Hospitals appear to be capable, after satisfying the objects of the Founder's Bounty, of affording a better Provision for the Cure of Souls in the Parishes with which they are connected," "suggestions for effecting such provision" are to be made.

As a sign of hope and promise for the future, the St. Katharine's Day Commemoration of the present year is altogether welcome and encouraging. In its details it is plainly susceptible of much improvement; but this could scarcely be otherwise. It would not be fair to judge the wisest and most dignified of mortal men—not even the Lord Chancellor himself—by his utterances and movements at the moment of his beginning to awake. A certain inconsequence and want of completeness and coherence is a natural accompaniment of the condition. And St. Katharine's Hospital is awaking at last out of a long and heavy slumber. Its preparation for renewed activity under the changed circumstances of modern life must follow, though the process may be slow. Much misapprehension exists as to the available revenues of the foundation, the full rental of its estates being often assumed as its present income. But the old system of leases renewed on fines is long in working out, and the twentieth century may have begun before the whole of the St. Katharine's estates have fallen into possession. Meanwhile, there is no reason in law or precedent to hinder the renewal of the old line of benefactors, "such as were John, Duke of Exeter," and the rest whose names are, or soon will be, commemorated in the bidding of prayers by the Master and Brothers; and it is not too much to hope that, before the present decade has expired, St. Katharine's Day may witness a more stately ceremonial in a collegiate church more in keeping with the dignity of the ancient foundation than its present pew-rented chapel, and even—why should it not be?—more in harmony with the traditions of its ancient name of "St. Katharine near the Tower" than is possible among the terraces of the Regent's Park.

#### THÉOPHILE GAUTIER'S CATS.

IN a delightful book, called *Ménagerie intime*, Théophile Gautier has given an account of his domestic pets, the list of which includes cats, dogs, chameleons, lizards, and magpies. The cats come first, and it is of their history that we propose to give a brief sketch, which it is perhaps the more desirable to do because cats are, to our thinking, as a rule, grossly underrated as regards their moral qualities, and because no one ever appreciated these qualities better than did Théophile Gautier. The little book opens with a characteristic statement:—"On a souvent fait notre caricature: habillé à la turque, accroupi sur des coussins, entouré de chats dont la familiarité ne craint pas de nous monter sur les épaules et même sur la tête. La caricature n'est que l'exagération de la vérité; et nous devons avouer que nous avons eu de tout temps pour les chats en particulier, et pour les animaux en général, une tendresse de brahmane ou de vieille fille." After

this we hear first of a dog whose history was curious enough; then of the cat Childebrand, "a cat of the romantic period," and then of Madame-Théophile, a sandy cat with a white chest, with a pink nose, and with blue eyes. This cat lived in constant and affectionate companionship with Gautier, and apparently its life was untroubled until one day Gautier took charge of a green parrot belonging to a friend of his who was going abroad. Madame-Théophile, who had never seen a parrot, was surprised naturally enough at the first sight of the bird. She looked at the parrot with an air of deep meditation, collecting all the ideas of natural history that she had picked up on the roofs, in the courtyard, and in the garden. Her thoughts were divined in the changing lights and expressions of her eyes, and it was not difficult to see that she came to the conclusion "This is certainly a green chicken." Having come to this conclusion, she went to crouch in a corner, and there thought over the chance of a delicate feast thus put before her, until "de petits frissons lui couraient sur l'échine, comme à un gourmet qui va se mettre à table devant une poularde truffée. . . . Ce mets exotique chatouillait sa sensualité." By this time the parrot was well aware of the danger threatening it. In a moment the cat leapt from the floor upon the parrot's perch, on which the parrot cried with a deep and solemn voice, "As-tu déjeuné, Jacquot?" The cat fell back as if struck by lightning, and the parrot seeing his advantage, followed it up with the exclamation "Et de quoi? De rôti du roi," after which Gautier saw clearly in the cat's face the thought, "Ce n'est pas un oiseau; c'est un monsieur; il parle!" Then the parrot broke out into triumphant song, and the cat, after casting a look of interrogation at her master, with the reply to which she was not satisfied, hid herself under the bed, where she remained for the rest of the day. "People," says Théophile Gautier, "who have not been in the habit of living in company with animals, and who, like Descartes, regard them as mere automata, will of course think that this story of what passed between the bird and the cat is embroidered by my imagination. What I have done is really only to translate their notions into man's language. Next day Madame-Théophile, having collected her courage, made another attack, which was repulsed in the same way. After this she gave it up, and took it for granted that the bird was really a human being." Madame-Théophile was distinguished, besides her encounter with the parrot, which has been more or less paralleled within our own experience, by an inordinate love of perfumes, and by a decided liking for music, which, however, changed to dislike when the notes of the highest register were sung. When the "la d'en haut" was given she invariably tried to shut the singer's mouth with her paw. We have lately observed the same peculiarity in a sheep-dog, which, habitually of excellent temper, always became irritated to an almost dangerous point if high notes, without any reference to the quality of tone, were continuously sounded.

The reign of Madame-Théophile was succeeded by that of Don Pierrot de Navarre, a white cat, whose personal affection was as marked as we believe, that of all cats that are properly treated is apt to be. In writing of Don Pierrot, Théophile Gautier takes occasion to make some admirable remarks upon the cat's nature in general:—"Conquérir l'amitié d'un chat est chose difficile. C'est une bête philosophique, rangée, tranquille, tenant à ses habitudes, amie de l'ordre et de la propreté, et qui ne place pas ses affections à l'étourdie: il veut bien être votre ami, si vous en êtes digne, mais non pas votre esclave. Dans sa tendresse il garde son libre arbitre, et il ne fera pas pour vous ce qu'il juge déraisonnable; mais une fois qu'il s'est donné à vous, quelle confiance absolue, quelle fidélité d'affection! . . . Quelquefois, posé devant vous, il vous regarde avec des yeux si fondus, si moelleux, si caressants et si humains, qu'on en est presque effrayé; car il est impossible de supposer que la pensée en soit absente." All people who have really studied the ways of cats will surely recognize the truth as well as the charming style of this description. The difference between them and dogs lies greatly in the fact that they will become your friend willingly enough, but never your slave. They reserve for great occasions the tokens of fidelity which dogs are willing to lavish at every moment. We know more than one instance of a cat, ordinarily constant to its own habits of comfort, breaking through its self-made rules to sit outside the door of an invalid, as if waiting for news.

Don Pierrot de Navarre had a companion called Séraphita, after Balzac's story, whose whiteness more than rivalled his own. Séraphita had "un caractère rêveur et contemplatif." She used to sit for hours immovably on a cushion, seeming to watch sights that it was not given to human eyes to see. She appreciated caresses, but was extremely reserved and discriminating in returning them. She had a marked taste for luxurious surroundings, and was very particular over her toilet. She, like Madame-Théophile—and so far as we know unlike most cats—delighted in perfumes and essences, "et, si on l'eût laissée faire, elle se fût volontiers mise de la poudre de riz." The white cats were supplemented by a troop of white rats, with which they lived on the most friendly terms. Don Pierrot de Navarre was especially fond of the rats, and would sit by their cage and watch them for hours together. When by chance the door of the room in which they were kept was shut, he would scratch and "meow" until it was opened. Séraphita, with her fine taste in perfumes, was less pleased with the rats, but never threatened or did them any harm. The rats, we are told in passing, came to a curious but possibly not unhappy end. On one thunderous day they were put into a tunnel in the garden to save them from the heat which

seemed to oppress them, and the first violent stroke of lightning killed them all in their cage. "Les fils de fer de leur cage avaient sans doute attiré et conduit le fluide électrique. Ainsi moururent, tous ensemble, comme ils avaient vécu, les trente-deux rats de Norvège—mort enviable, rarement accordée par le destin!"

To the *dynastie blanche* there succeeded a *dynastie noire*. Don Pierrot de Navarre's unlucky habit of staying out all night brought on a kind of consumption, the course of which he supported admirably. "Rien de plus touchant qu'un animal malade; il subit la souffrance avec une résignation si douce et si triste!" Everything was done for him that could be done; a doctor came and listened to his breathing, and prescribed asses' milk for him; but it was too late. Just before his death, which is described in moving terms, "il nous jeta un regard qui demandait secours avec une supplication intense; ce regard semblait dire, 'Allons, sauve-moi, toi qui es un homme.'" Two or three years later Séraphita died, but there was left a family of three black cats. "Explique qui voudra ce mystère," says Gautier. Of these Enjolras, the handsomest, was conscious of his own majesty, and was, indeed, somewhat given to posing. He was also very greedy, and grew to huge dimensions, which led to his being shaved, in imitation of a shaved poodle. Gavroche, the second black cat, had an "expression fûtée et narquoise," as if to do justice to his name. He was of a buffoon-like nature, and was too apt to seek his diversions with the street cats, forgetting the dignity he inherited from Don Pierrot de Navarre. But a redeeming trait in his character was his charity to stray starving cats that he brought in to share his meals—a trait which most observers of cat life will be able to match from their own experience. "Les pauvres hères," as Gautier with admirable gravity calls them, used under Gavroche's auspices to snatch a fearful joy from the furtive feast, which they dreaded every moment might be interrupted by the sweep of an intolerant housemaid's broom, and they did more credit by their appearance and manners to Gavroche's heart than to his head. Epouine was the most delicate and refined of the three black cats, and in some ways the most human. She had a fine manner of doing the honours of the house to visitors who were waiting to see Gautier; she used to sit up at table at dinner-time, and, in spite of her fondness for fish, she would always consent to eat her soup first if one said to her, "Mademoiselle, une personne qui n'a pas faim pour la soupe ne doit pas avoir faim pour le poisson." She always knew when there was to be company at dinner, and, unless she recognized some or one of the guests, she withdrew on those occasions to the vantage ground of a footstool. Enjolras and Gavroche came to unhappy ends; but Epouine was still living, with one companion, an Angora, when Théophile Gautier wrote her history. He breaks off his history with the remark that he is afraid of tiring his readers, since "les histoires de chats sont moins sympathiques que les histoires de chiens." Of his dogs also he has left a charming record, of which we may have something to say on a future occasion.

#### THE CATTLE SHOW.

THE Cattle Show at the Agricultural Hall this week has been one of the most successful ever held there. The animals exhibited are remarkable for a high average of excellence, and the attendance has also been very large. As the Show at Birmingham the week before was likewise very successful, the fact is doubly satisfactory. The long-continued agricultural depression would have led one to expect rather a falling-off in these Shows. When rents are falling all over the United Kingdom, when so many farms are vacant, and when farmers generally find it so hard to hold their own, we should not have been surprised if there were little heart left for improvement. It is gratifying, therefore, to find that the desire for improvement is not only as strong as ever, but apparently even stronger. The money prizes offered amounted to 2,480*l.*, while plates, medals, and cups raised the aggregate value to nearly 3,500*l.* We have here evidence that the support afforded to the Club is not falling off. Moreover, the cattle entries numbered 238—an increase of 31 over last year, though nearly the same as in 1875. The pens of sheep numbered 180 against 138 last year, and 150 in 1879, and the pens of pigs were 85, against 62 last year, and 50 in 1879. These figures are certainly in remarkable contrast with all we hear of agricultural depression. We are afraid, however, that we must not infer from this continued support and from the increased number of animals exhibited that the depression is drawing to a close. It is true, of course, that the depression has not been as great in cattle-farming as in tillage. It has its origin in continued wet seasons, and rain is much more injurious to grain than to grass or roots. But even for grass and roots there may be too much rain. And, besides, an incessant downpour overcharges the earth with moisture, and produces disease in both cattle and sheep. Even, therefore, in cattle-farming the past few years have not been prosperous, as, indeed, the abatement of rent voluntarily made by landlords all over the country and the agitation for a change in the Land-laws sufficiently prove. But the most conclusive evidence that we must not infer too much from the success of the Show at the Agricultural Hall this week is afforded by the increased exhibition of sheep. The Agricultural Returns published last August tell us that the number of sheep in the United Kingdom has fallen away by nearly two

millions, as compared with last year, and by nearly four millions as compared with 1879. It is true that the whole decrease in sheep is not dead loss, though probably the larger part of it is. The decrease is mainly due to the wet weather of 1879, which overcharged the soil with moisture and produced the diseases from which hundreds of thousands of sheep died. This year, again, as our readers will remember, the spring was dry and cold, and July was intensely hot. The pastures in consequence became parched up, and the farmers, for want of "keep," were obliged to sell their sheep before they were properly prepared for market—that is to say, to sell them at a loss in price. Yet, in spite of this depression in sheep-farming, we have the remarkable fact stated above, that the pens of sheep exhibited this week at the Agricultural Hall are forty-two more than last year, or an increase of over twenty per cent. The truth, no doubt, is that the preparing of cattle for exhibition is too costly for the ordinary farmer. The animal, in the first place, must be of pure breed, or it has no chance of gaining a prize, and all the labour and money expended upon it will be thrown away. Further, it requires special care and special feeding from its very birth; while the risk of disease is considerable. The ordinary farmer cannot devote his time to the labour thus involved, nor can he risk the loss should the animal happen to die. Consequently the business has fallen into the hands either of amateurs rich enough to disregard the cost, or of professional breeders who make a special study of this branch of agriculture. Even the average excellence of the Show this year confirms what we say. The "ugly brutes" which never had a claim to a place in the Show, except such as was afforded by excessive fat, and on whose absence this year we are congratulated by the newspapers, were evidence that ordinary farmers not only felt an interest in the Shows, but were anxious to take part in them themselves, when they possessed an animal exceptional in any respect. But now the ordinary farmers have withdrawn altogether from the contest, and have left it to those who make it, as we have said, a special business. Still the success of the Show is not without significance. It proves that the leaders of British agriculture are not discouraged either by the long succession of bad seasons or by the fierceness of foreign competition, and that they retain their faith in improvement. This in itself is an important symptom, giving grounds for the belief that things are not quite so bad as they are sometimes made out to be. The succession of bad seasons has, no doubt, been very long, and has caused excessively heavy losses; but it was preceded by a long term of prosperity. In any case, the existence of a hopeful spirit amongst the leading agriculturists of the country is a fact of no inconsiderable significance. We remarked last year upon the success of the Scotch cattle, and this year the success is still more remarkable; in fact, the prizes for the best male and the best female animal exhibited, as also the one hundred guinea champion plate for the best animal of the Show, were carried off by a Scotch steer and a Scotch heifer. Last year the excellent show of Scotch beasts was attributed to the good seasons with which Scotland had been favoured for two years running; but this year the weather has been exceedingly bad in Scotland, and the result therefore cannot be attributed to that cause.

One other feature of the Show lends weight to the observations we made last year upon the revolution which cattle-farming is undergoing in this country. The two animals just referred to, which were declared the best in the Show, were barely two years and eight months old. The heifer weighed nearly 17 cwt., and the steer very nearly 16 cwt. The early and extraordinary development thus attained is a marvellous instance of the power of selection. How much forethought, judgment, and skill must have been applied generation after generation in selecting parents before a progeny could have been produced possessing this wonderful aptitude to yield meat at so early an age. From the special point of view, however, which we are here taking of the Show, the significance of this early development is in the evidence it affords of the desire to produce meat juicier and less fat than formerly in a shorter space of time. A few years ago animals were not deemed worthy of a prize until they had attained a mature age and become monsters of fatness; but now only young animals are allowed to be exhibited at all, and the great effort is to produce them as young as possible. Partly this is the result of more scientific knowledge of dietary, and partly it is due to the changed taste of the public. When men lived largely in the open air, indulged in violent exercises, or were employed in out-of-door occupation, they could digest almost any kind of meat; but to dwellers in towns—and the population of this country now practically consists of dwellers in towns—it is essential that meat should be juicy without being too fat. Lastly, no doubt, the effort is inspired by a desire to lessen the cost of producing meat. The longer an animal has to be fed the costlier of course it is, and therefore every abridgement of the period of rearing and feeding cheapens the production of meat. Of late years the efforts of the leaders of English agriculture have been directed mainly to the selection of breeds which will put on flesh while they are yet young, and, as we see from the instances just cited, with wonderful success. No doubt it was hoped that in this way the English farmers would be able to retain their command of the home market, but the hope has not been realized. Nations nowadays are so closely connected with one another, and the accumulation of wealth in new communities, especially in the United States, is so rapid, that the improvements made in any one country soon become the common property of all. Thus Ameri-

can farmers are able to buy the best breeds of this country, and so to improve their own; and the construction of railways all over the United States, with the application of steam to navigation, enables the American farmers to compete with our own in the English market. We will not enter into the dispute as to whether American beef is equal to our own; but it is an undoubted fact that American beef is largely consumed in this country, and is often sold as prime Scotch without detection. Our English farmers, therefore, cannot hope to maintain the command of the home market by merely improving the breed of their cattle, and unfortunately the great mass of farmers have not followed the pioneers of cattle-farming even in this direction. Probably the cost of a prime breed has deterred them; but there have also been a want of skill and a slowness in appreciating the changes which are taking place around them, which have kept English cattle-farming in the background, and have thus enabled Americans to compete successfully with them at home.

In spite, then, of the gratifying success of the Cattle Show this year, we cannot regard the prospects of cattle-farming in this country as satisfactory. Year after year land is being turned from tillage into pasturage, but still, as we have already observed, the number of sheep actually decreases, being now less than in any year since the Agricultural Returns first began to be kept, and the number of cattle do not increase as we should expect. At the same time the population is growing rapidly. Wealth is accumulating in an unprecedented manner, and the standard of living is steadily rising. The demand for meat is, therefore, increasing year by year; and yet, as we have said, the home supply does not increase. Making every allowance that may be necessary for cattle plague, for unfavourable seasons, and for any other causes the reader may choose to assign, it is yet unsatisfactory to find that our farmers have not been able to meet in a fuller manner this steadily growing demand. The farmers of the United States have imported English breeds and have improved their own breeds thereby, and are now competing with us in our own markets. Even our colonists in Australia and the farmers of the River Plate are preparing to compete actively. All this, of course, is satisfactory from the point of view of the consumer; but it is unsatisfactory from the point of view of the home producer, and it is unsatisfactory from the point of view of the economist. Wherever there is neglect to develop to the utmost the wealth-producing capacity of the soil, there is a waste of the resources of the country, and therefore a loss of wealth. We cannot doubt that the soil of this country could produce a much larger supply of animal food if proper skill were devoted to the business. Our farmers, however, taken altogether, do not possess the requisite skill; and meritorious, therefore, as are the efforts of the exhibitors at cattle shows, it is clear that those efforts are not sufficient to keep the business ahead of foreign competition. Leaving political questions entirely apart, it would be worth the while of the Royal Agricultural Society to inquire into the causes of this state of things, and into the remedies which ought to be applied.

## REVIEWS.

### THE TIMES OF THE FIRST FRENCH EMPIRE.\*

THE interest attaching to the letters of Mme. de Rémusat is not comparable to that which attached to her Memoirs. They are very good letters for a wife to have written to a husband, but they are only good in the sense that they express in well-chosen language the feelings of an affectionate wife and a sensible woman. To say in forms as varied as possible how dull she is without him, to inquire with sincere interest after his colds, and to tell him whom she has been seeing, who has been pleasant or well-dressed, and who has been the reverse, is the proper duty of a wife when writing to a husband at a distance. This duty Mme. de Rémusat zealously fulfilled, and what she wrote she wrote well. The letters of Mme. de Sévigné were her favourite study, and she zealously strove to emulate, or perhaps imitate, the best of models. She was always and consciously improving herself; reading hard at the best books, reserving difficulties for the enlightening conversation of her husband, and taking infinite trouble to keep herself far enough ahead of her clever eldest son, so as to be able to educate him while he was a boy. She was devotedly attached when she was attached at all, and her affection for Josephine almost rivalled her affection for the different members of her own circle. Of a pure and high character, she disapproved much that went on around her at the Court of Napoleon, but she was too much accustomed and too suited to the atmosphere of a Court not to take the world as she found it, and she played the part not so much of a critic as of an amused and humorous outsider. In her Memoirs she gave full play to her fun, her power of quiet appreciation, her love of a good story, and her interest in the gossip

\* A Selection from the Letters of Mme. de Rémusat to her Husband and Son, from 1804 to 1813. From the French, by Mrs. Cashel Hoey and Mr. John Lillie. London: Sampson Low & Co. 1881.

Memoirs of Count Miot de Melito. Edited by General Fleischman. From the French, by Mrs. Cashel Hoey and Mr. John Lillie. London: Sampson Low & Co. 1881.

The Marriages of the Bonapartes. By the Hon. D. A. Bingham. London: Longmans. 1881.

of the day. When writing to her husband she had too much respect for herself and for him to be gossiping, witty, or amusing. There is, therefore, very little to be found in this selection from her letters which can be called a contribution to the history of her times. If they offer any contribution of the kind, they do so chiefly by giving one more proof that high-minded women are to be found in every age and in every form of society; and that in the Court of Napoleon, which, as a whole, seems such a dismal mixture of mock grandeur, frivolity, and petty tyranny, a highly educated, pure, affectionate, and religious woman could find a natural and not unsuitable place.

Very much the same impression is produced by another work referring to the times of the First Empire. The translators of the letters of Mme. de Rémusat have, almost at the same time, placed before the English public a translation of the ponderous *Memoirs of Count Miot de Melito*; and they have executed both tasks with an intelligence, an ease, and an accuracy which, if a few obvious errors had been corrected, would leave little or nothing to be desired. Count Miot de Melito, as a man, singularly resembled what Mme. de Rémusat was as a woman. He, too, lived in Court circles—first in the Court of Napoleon, and then in that of Joseph; shared their splendours and miseries; strove to do his duty; mourned, in a gentle, high-minded way, over much that he had to witness; strove to be just, moderate, liberal, and generous; lost rather than made money by success; was faithful in adversity; and loved strongly where he loved. What Josephine was to Mme. de Rémusat, Joseph was to Count Miot de Melito, the object of friendly regard, of unceasing interest and devotion. Both set out with a passionate admiration for Napoleon, both came to see that he was rushing over a precipice, and both were alienated by the tyranny and neglect with which the great man treated the lesser persons to whom they were specially attached. Mme. de Rémusat was much the cleverer of the two. She had sparkle and grace, while Count Miot de Melito seldom rises above common sense and the ease and dignity of an instructed man accustomed to good society. But in tone, in justness of thought, in the desire to be at their best in all circumstances, and in affectionateness, they are one.

Count Miot de Melito was born in 1762, and at the earliest possible age began his official life. He was the son of a chief clerk in the War Office, and was pushed into and on in the hereditary calling. In 1788, when he was twenty-six, he was appointed Commissary of War, and was sent to one of the military divisions which had been recently established. His position enabled him to observe and record the numerous symptoms of discontent in the French army before the Revolution broke out. He found soldiers and officers keenly interested in political questions, and complaining of mismanagement which they found vexatious. M. Miot, as he then was, had duties to perform which kept him at Versailles during the months in which the first scenes of the great drama of the Revolution were played out. Some of these scenes he describes with spirit, but has little to add to what is already known to the readers of history. He looked at passing events with the eyes of a cautious high-minded official, with a leaning against the Court, and a hope that better times would some day come, but serving every Government with punctilious fidelity. For three years after the Court was brought to Paris he stayed in the War Office, ascending in the regular course of professional promotion; but in 1793 he changed into the Ministry of Foreign Affairs, and continued in that department until 1799. When he entered the Foreign Office his temporary chief was an intimate friend of Danton and of several of the revolutionary chiefs who were crushed by Robespierre. The triumph of Robespierre brought M. Miot a new chief, who never troubled himself with any of the business of the department, spent his time between billiards and backing up every decree of blood and terror, and at last told his trembling subordinate that he was to be arrested the next day. That day was the 9th of Thermidor. Robespierre fell, and M. Miot was saved. Again he had to work under new masters, and again he was promoted, being appointed early in 1795 to the post of Minister Plenipotentiary at Florence. The brilliant victories of Napoleon in 1796 placed Tuscany at the mercy of France, and M. Miot did the best he could to prevent the Directory from overturning the old Governments in Italy and substituting Republics. He even sought an interview with Bonaparte, and tried in vain to convert the young hero to his projects. Although he failed, he did not incur the displeasure of his superiors, and was made towards the end of 1796 Ambassador at Turin. On his way he was ordered to touch at Corsica and endeavour to establish something like order in that distracted island. This visit is principally remarkable because during it he saw at Ajaccio for the first time Joseph Bonaparte, with whose fortunes his own were at a later period so intimately associated. "His mild and refined countenance," says Count Miot de Melito, "affable manners and polished language prepossessed me in his favour, and I date from this first meeting the sincere affection I have ever entertained for him." During his short stay at Turin he further cultivated his friendly relations with the Bonapartes, for he made an expedition to the Lago Maggiore with the General and Joséphine, and Joseph paid him a visit, during which he and the author congratulated each other on not having to stay in Italy and witness the violent revolution which the Directory was proposing to the Italians. During Bonaparte's absence in Egypt M. Miot was looked on with some disfavour on account of his known intimacy with the Bonapartes, and all that was done for him was to send him in a very vague capacity as an attendant in Holland on one of his old Foreign Office chiefs. It was when in Holland

that he heard of the return of Bonaparte and of the *Coup d'état* of November 1799. His friends having triumphed, M. Miot profited by their success and was appointed Secretary-General of the Ministry of War. Subsequently he was made a member of the Tribunal and then a Councillor of State under the Consulate. He served for six years in various capacities under Napoleon, until at the beginning of 1806 he was told to join Prince Joseph at Naples. Thenceforward he served the King of Naples and the King of Spain, not Bonaparte himself, took his share in the quarrels of the brothers, and was always for Joseph and against Napoleon. During the years which passed after Napoleon had been made First Consul and the creation of the new kingdom of Naples, the attitude of M. Miot to Napoleon had been that of a fairly honourable and self-respecting man. He found himself very much ordered about, sent off here and there, told one day to act as a temporary dictator in Corsica, and another day to act as an extraordinary police inspector in the North of France. He had to concur in many things of which he very faintly approved, and he had the pain of witnessing many quarrels in which the weak vanity of Joseph came in conflict with the violence and domineering of his brother. But he could honestly persuade himself that the supremacy of Napoleon was not only inevitable, but beneficial; that the Empire was the nearest approach to orderly government which was then possible; and that Napoleon justified the adhesion of his followers, not only by his military genius, but by his varied ability in civil affairs, his spirit of compromise which led him to make peace with the Church and the aristocracy, and by the possession of fascinating qualities, to the influence of which M. Miot owns that he himself was fully alive.

Joseph was created King of Naples in April 1806, and on May 13 made his solemn entry into the capital. "He was cheered by thousands of voices, and received everywhere with the real or simulated gladness that is never wanting on such occasions." Unfortunately, the new reign was clouded by the English occupation of Capri, which closed the sea to the King, and entirely prevented him from carrying out the instructions of Napoleon to signalize his career as a sovereign by the conquest of Sicily. It was, however, only in a very limited sense that he could be called a sovereign. Massena was in command of the army, and a French Minister of Police directed the internal administration. Both conceived themselves to hold their offices directly from Napoleon and to be answerable to him, and during the absence of Joseph in Calabria, Massena and the Minister of Police put to death an influential Neapolitan who had been tried and acquitted by court-martial. They never thought of referring to the nominal King; and, although Joseph expressed his extreme displeasure to his own little circle, he could do nothing publicly but acquiesce. He tried to govern as far as he was allowed. He had a Council of State and a Ministry, in which M. Miot figured as Minister of the Interior. Joseph was sincerely anxious to conciliate the Neapolitans, and appointed as many respectable Neapolitans to places in the Government and the household as he could find room for; but nothing could allay the jealousy felt towards the French officials; and the extraordinary cruelties of Massena and the Minister of Police in Calabria—of which Joseph, as usual, disapproved, and which, as usual, he countenanced under compulsion—rapidly alienated the feelings of the people. The new Government had no money; and, in order to exist, had at once to pillage the monasteries. M. Miot wished for more radical measures than the King would sanction. He advised the total suppression of the monasteries and the exclusion of the monks from teaching. The King, under orders from Paris, took a different view. Being at peace with the Church, Napoleon ordered that the monasteries should be only pillaged as far as was necessary; and, looking on the spread of popular and liberal ideas as dangerous to the State, he wished to leave education in the hands of the clergy. Massena had left, and the King made the Minister of Police also Minister of War, and the next day wished to dismiss him in disgrace. M. Miot disliked the man, but remonstrated against such a demonstration of sudden caprice, and Joseph gave way. By the middle of 1807 things had got into a better state. The peace of Tilait had confirmed the power of Napoleon to an extent which made the Neapolitans think that they had nothing to do but to acquiesce in the Government which he had set up for them; and Joseph and M. Miot, who were both men of cultivated tastes, had leisure to patronize art, promote harmony, and make roads. They witnessed together with calm curiosity the annual festival or miracle of St. Januarius in September, and as the Emperor had ordered a considerable sum to be sent monthly from Paris in aid of the Neapolitan Treasury, they were happy, confident, and useful. For something like six months the King and his Minister might seem to themselves as if they had got something worth having out of the high positions accorded them. But all of a sudden their bright sky was overclouded. To be forgotten by Napoleon was something like happiness, and to be remembered by him was misery. At the end of 1807 Joseph was told to come to Venice, and then he found that his brother had been thinking of him, and was going to make him King of Spain. A little time was left to the friends to pack up, and then they bade adieu to their humble home, and exchanged the harmlessness and quiet of monarchy at Naples for the misery and degradation of monarchy in Spain.

It was in July 1808 that the new King entered Spain, and it was in June 1813 that he was finally driven across the frontier by the victorious army of Wellington. Thus Joseph had almost exactly five years of sovereignty in Spain. There was scarcely a

moment in these five years in which his position was endurable. M. Miot had been made Count Miot de Melito by Joseph just before he quitted Naples, and the title had been confirmed by Napoleon. In Spain the new Count was chief of the Royal Household, and was officially as well as personally on terms of the greatest intimacy with the King. From the outset, Count Miot de Melito saw that there was a very great difference between Joseph's position in Naples and Joseph's position in Spain. At Naples it was possible that he should at least seem to be a king, do some good, and give play to his natural kindness. There was no such possibility in Spain, for Spain during the whole of his reign was the theatre of war. The war had to be carried on by generals, and there was no room for a civilian brother of Napoleon in the practical conduct of administration. Then, as Napoleon was continually obliged to fight in Spain, and could only hold what he held by superiority of arms, he treated Spain as his by right of conquest. It was entirely a matter of policy and prudence what part of Spain he should leave to Joseph, and what part he should annex to France. Joseph was not, therefore, King of Spain in the sense in which Spaniards understood the term. He was merely a sort of prefect in districts which the conqueror assigned to him. This, he himself felt, was not to be king, and yet he held this humiliating kingship for five years. Count Miot de Melito was present at several of the most important scenes of Spanish history in these years. He was present when the junction of the French forces forced Wellington to retreat into Portugal after the brilliant success of Salamanca. He was among the fugitives who hurried towards France after the disaster of Vittoria. He is always accurate, and often lively, in his descriptions, and he has, therefore, much to say of events in Spain that is worth reading. But he has little that is new. What he describes has been already described by many others. It is in his study of Joseph, of Joseph's character, of his goodness and his weakness, that he has most that is new to tell. He was constantly advising, urging, begging Joseph to give up his miserable dignity and resign. He sometimes seemed almost to have succeeded, but in the end Joseph always went on. As early as November 1808, he did his best to get Joseph to resign when the Emperor, during his short stay in Spain, entirely superseded the King, and announced his intentions with regard to Spain as if he had been speaking of a country with which Joseph had nothing to do. Again, in the beginning of 1810, he strongly urged Joseph to resign on the receipt of an Imperial decree in which Napoleon showed that he had made up his mind that Spain must be dismembered. At the end of 1810 Napoleon sent to Joseph the extraordinary suggestion that Joseph should treat with the Cortes assembled under English protection at Cadiz, and should offer, if the Cortes would accept him as King, to regard it as the proper representative body of the nation, Napoleon offering, if this could be arranged, to allow the provinces north of the Ebro to be restored to Spain. The French Minister was directed to support this suggestion orally, but to put nothing in writing, so that the Emperor might be free to throw Joseph over at any time. This time Joseph was so mortified that he broke into the most violent invective against the Emperor, not in private, as usual, but before a group of persons, many of whom were very insincere in the support they gave him. Count Miot de Melito was extremely distressed at the King's want of self-command; but was all the more urgent privately in advising him to resign or to seek an interview with Napoleon, and get a positive assurance that if he stayed his miserable position should be improved. The King again temporised; but in the spring of 1811 he made up his mind to go to Paris, and was accompanied by the Count. Joseph nominally went to attend the baptism of the King of Rome, and did all in his power to turn the opportunity of seeing his brother to account. But Napoleon kept him at arm's length, would scarcely see him, and made no concessions beyond that of paying a month's subsidy in advance. He had too just an estimate of Joseph to believe in his threats of resignation. Joseph drank the last dregs of the cup of humiliation, and decided to go back to Spain. As the Count says, "A desire to escape from the restraints imposed on him at Paris, the charm which, notwithstanding the most painful experience, still lingered in the merest shadow of supreme power, and, more than all, perhaps a love affair at Madrid, which attracted him to the capital, led him, in opposition to the counsels of his most devoted friends, to decide on returning to the Peninsula." Among those devoted friends was Count Miot de Melito, and yet the Count, though strongly tempted to stay in France, generously listened to the promptings of gratitude and affection and returned to Spain with the King. He was with him till his fall, returned to Paris with him, and was faithful to him even in the extreme of his degradation, when Joseph was no longer called King of Spain but King Joseph, and was only allowed to go to the theatre under the surveillance of the police. After the occupation of Paris by the Allies the Count was asked to obtain a passport for Joseph to leave France, and this was obtained; but the condition was inserted in the passport that Joseph was not to re-enter France without permission. This Joseph considered so derogatory to his dignity that he quarrelled for the moment with his faithful friend for accepting such a document. Even during the Hundred Days Count Miot de Melito was at first received with coldness by Joseph, but before Waterloo put an end to Joseph's new grandeur the old intimacy was revived. It stood the test of time and exile; and ten years later the Count, who had retired into extreme privacy at Paris, crossed the Atlantic to visit Joseph, who was then living in the United States under the title of the Count of Survilliers.

Napoleon could do neither with his brothers nor without them. France saw in him its own hope of stable government and gladly allowed him to make himself First Consul and Emperor; but a Government that hung on one life could not be stable, and he had to think of a successor. Passing over Lucien, whose second marriage he could not pardon, he placed his brothers in the line of succession, reserving the power of adoption, which he intended to exercise in favour of the eldest son of Louis until the child died, and then he divorced Josephine and centred his hopes on the King of Rome. With his brothers in the line of succession, and being himself Emperor, he had to settle the position of his family, and could scarcely settle it in any other way than by giving it Imperial rank. His conquests grew beyond what he could annex to France, and in some of the countries he had to set up totally new Governments. Republicanism was out of character with his own Imperial system, and so he had to set up monarchs. To have gone outside his own family would have been to set up rivals to his nephew or son, and would have been to confess that the Bonapartes were not really an Imperial stock. It was not through a freak that he made three of his brothers kings, but because he could not help it. In his own mind, however, he always thought that his brothers and his family owed everything to him. They were the creatures of his own triumphant genius, unable to understand why they were put here or there, and still more incapable of understanding what they were to do in the position that had been assigned to them. He had a natural love of interference, and he had a deep conviction that those whose fortunes he had made existed only to do his pleasure; and he took an extreme delight in arranging every possible action of their lives, including their marriages. His family, however, was not nearly so subordinate as he wished. In the first place, his brothers and sisters took their Imperial position with a comic seriousness. They seemed to themselves as if they had been born to the purple, although that very unimperial person, Mme. Mère, was always at hand to remind them of their humble origin. The crowned brothers, and especially Joseph, believed that they reigned not so much by the grace of Napoleon as by a sort of divine, if not hereditary, right. When they had come into their kingdoms they wanted to be good kings. It was their territories they had to defend and their subjects they had to protect. This was in its way creditable to them, and placed them in dignity above the level of the puppets which they always were in the eyes of Napoleon. But he looked at facts more closely than they did, and he knew that his frail system of Empire would break up at all points if it broke up at any. Hence constant dissensions, quarrels, reconciliations, submissions, marriages ordered and marriages counterordered. The family history of the Bonapartes is thus the key to much of the general history of the time; and it is so very complicated, as it includes the history not only of the Bonapartes but also of the Beauharnais, that it amply deserves a treatise to itself. The task has been accomplished by Captain Bingham with much industry, judgment, and success. Fortunately, if the subject is complicated, and at times trivial, it is also amusing; for both the men and the women of the Imperial family did very odd things, and were a law, and often a bad law, to themselves. Captain Bingham's work is necessarily a compilation. He could but take what he found in the accepted authorities, and piece together fragments of information; but the compilation he has made is a very good one. There are some obscure points in the family history of the Bonapartes, such as the real date of Napoleon's birth and the real facts as to Napoleon's religious marriage with Josephine, and these points are discussed by Captain Bingham with clearness and acumen. A happy mean is preserved between the avoidance of scandals—without reference to which a history of the Bonapartes would be singularly incomplete—and too protracted a dwelling on disagreeable topics. Above all, these volumes have the great merit of being very pleasant reading, and may be expected to interest a large class of readers who like family history better than history properly so called, while they will serve as a very useful book of reference to those who may have from time to time to refresh their memories as to the minor events of the times of the First Empire.

#### HODGSON'S ERRORS IN THE USE OF ENGLISH.\*

WE hope, but not with confidence—to borrow a phrase from Carlyle—that this book may do some good. This expression of doubt is not to be taken as reflecting upon the author; what we fear is, that the stupidity and perversity of mankind are past correction. Orthodox divines tell us that, though heresy may seem to be an error of the intellect alone, it really springs from some deep-seated moral disease. It would be possible in like manner to make out profound moral causes for the writing of bad English. For example, the sinful pride which seems to look into a dictionary is doubtless answerable for much of the prevailing abuse of words. In old days, when a man met with a hard word, he went and looked it out in the dictionary. But novelists and essayists sneered at the people who took this sensible course until it came to be thought that to use a dictionary was to proclaim oneself a dunce. People now suppose that they understand long

\* *Errors in the Use of English.* By the late William B. Hodgson, LL.D., Fellow of the College of Preceptors, and Professor of Political Economy in the University of Edinburgh. Edinburgh: David Douglas, 1881.

words, as a Cambridge man is said to have maintained that he understood Euclid's propositions, "by intuition." Vanity, of course—the vanity of using hard words, or fine words, or the slang in vogue—has much to do in producing bad English; so also has deliberate choice of bad models. This last, it may be said, is a mere error of judgment, of taste; but not so. A man who goes to church, says the responses, and reads his Bible, as a good Christian and Churchman should, becomes so habituated to noble and rhythmical English that no other will please him. If he neglects his Sunday duties, goes to music-halls to hear comic songs, and confines his reading to the penny papers, we leave it to religious tracts to say what is to become of him spiritually, but certain it is that for his literary style there can be no hope. And with him, as with other sinners, the difficulty will be to convince him of his sad estate. Those who most need such a book as Dr. Hodgson's will probably be the last to look into it. One might as well expect the cook in Mr. Hardy's novel who trimmed her bonnet with bright red and yellow because she loved "to have a flare-up about her head of a Sunday," to peruse æsthetic treatises and study arrangements of half-tones. The writer of the worst class is too well pleased with his flare-up of misunderstood words and mangled and misapplied French and Latin quotations to seek to exchange it for a purer style. But although we may not hope to turn him from the error of his ways, it may yet be possible to train the new generation in better courses. The work before us is intended to be used as a lesson-book—the lessons chiefly taking the form of "awful examples." As may easily be supposed, it is lively reading enough, though it will probably force upon the mind a conviction that, as no man can be a poet, so no man can write English. We at least are convinced of this by seeing that Dr. Hodgson has extended his criticism even unto us, and has discovered errors in our own columns. Research might perchance prove himself not faultless; we suspect that if any one but himself had written "That were unhappily no easy aim," he would have at once observed that the difficulty is not to aim, but to hit. "No easy mark" is what he meant. His persistent use of *were* for *would* be will provoke criticism from some; but, as students of our older language know, it is historically and grammatically correct, though it may have a somewhat quaint and archaic effect.

Seriously, to write good English is no such simple matter as is commonly supposed. To abstain from using words which one does not understand is perhaps the first and the easiest step towards the desired end; and the book therefore rightly begins with a sort of glossary of "spurious words, and words used with meanings other than their own." A note to the preface tells us that the author did not live to see his work through the press, and that indulgence is therefore asked for any "errors and imperfections" which may have escaped revision. Except that the index is a poor one, we have, as far as we have examined, found no need of such indulgence. Omissions there are, and must be; who can number all the forms of human error? On some points the author's opinions are contestable, and here and there he shows that tendency to hypercriticism which results from the practice of minute research for mistakes. This is exemplified in his insistence that *verbal* cannot rightly be used as synonymous with *oral*, because it must apply equally to speech and to writing, "seeing that it is as impossible to pen as it is to utter a sentence without the use of words." Now, as we have *oral* and the legal term *parol* to express "by word of mouth," it might perhaps be convenient for the future to assign a different function to *verbal*; but, in the face of the fact that the Roman law distinguished *obligatio verbis* from *obligatio literis*, and in the face of such a phrase as "Plura illi mandata verbo, quam scriptura dedi:"—the example selected by Facioli to show how *verbum* may stand *pro viva voce*—Mr. Hodgson's contention cannot be maintained. We might indeed, if disposed to be captious, retort that in strictness it is not words, but the signs of words, that are written.

Remarks upon a book of this kind are apt to take the form of hostile criticism. Assent is general and brief; it is only when one dissents that one has anything to say. For the most part we agree with the author, and therefore we have little comment to make. It is with especial satisfaction that we read his remarks upon the misuse of the terms *female*, *lady*, *individual*, and *party*, the last being, he points out, a vulgarism, or rather, when it began, a polite affectation, of considerable antiquity. So indeed is *female*, as Touchstone in *As You Like It* informs us. Excellent too are the warnings against the common misapplications of *aggravate*, *allude*, *alternative*, *calculated*, *condign*, *condone*, *decimate*, *limited*, *mutual*, *partake*. Of these it may be said that they are rarely misapplied by any careful writer, though only the other day we saw in an episcopal address *calculated* for *likely*. But even good writers have often forgotten that *climax* means, not the acme or topmost point, but a ladder or ascending scale; and that *avocation* ought in strictness to be opposed to, rather than synonymous with, *vocation*, as is well illustrated by a sentence from Fuller:—"Heaven is his *vocation*, and therefore he counts earthly employments *avocations*." But here it is easy to see how the confusion arose. It sounded grand to treat the everyday and necessary business of life as a vexatious distraction from nobler pursuits. As the pious man spoke of his earthly calling as only an interruption to his devotional life, so the occasional author spoke of "the professional avocations" which took him from the service of the Muses. Desdemona's "house affairs" were her *vocations*, but when they drew her away from hearing Othello tell his adventures they were doubtless, in the opinion of both the

lovers, *avocations*. With regard to *condone*, it would have been well if the author had explained the technical legal sense of *condonation*, in which it means something beyond a mere pardon, and implies a blotting out of the offence. It may be a question whether the use of *demean* in the sense of *debase* can be altogether condemned. In the beginning it is likely enough that it was a mistake, founded, as Professor Skeat says, "on an obvious (but absurd) popular etymology, which regarded it as composed of the Lat. *de*, 'down,' and the Eng. *mean*, 'base';" but it has so far established itself that Latham's Dictionary is justified in treating *demean* = *behave* (from *démener*) and *demean* = *debase* as two words. At least, the usage is not, as Mr. Hodgson seems to have thought, modern. Latham gives an example from Abbot in 1601, "far demeaned beneath all kingly state." In his strictures on a public speaker, who talks of "permeating the masses with sound ideas," the author has not been happy in suggesting corrections. He says it ought to be "to teach the masses sound ideas" or "to instruct the masses in sound ideas." Now you may teach the masses to form sound ideas, or instruct them so that they may have sound ideas, but you can hardly teach the ideas—that is, the mental images—themselves. We do not fully agree with his remarks on the verb *spare*. He says that this has acquired a "secondary, mainly colloquial, meaning of 'grant, vouchsafe,' e.g. 'Spare us a copper.'" But in this vulgar phrase there is surely a meaning beyond that of "grant" or "vouchsafe." It would not be easy to follow the chain of thought by which *spare* acquired all its various senses; but it is clear that it has come to convey a notion of having something over and above, e.g. "I have enough and to spare," and thence of something that one can well do without, that one can give away without feeling the loss:—"I could have better spared a better man." The beggar who says "Spare us a copper" is appealing to the rich man who, out of his wealth, can so easily afford to give away one small coin. The idiom is Shakspearian:—

What, not an oath? Nay, then the world goes hard  
When Clifford cannot spare his friends an oath.

*Grant* or *vouchsafe* would not so well convey the insinuation that Clifford in his day had been, as one may say, flush of bad language. Further on, in the fourth part, on "libetoric," the author might have pointed out the true form—at least if we conceive it aright—of the metaphor of "breaking the last link of the chain." Of course the man who writes "I broke the last link of the chain that remained to connect me with taverns" is faulty in his metaphor, albeit meritorious in his act. But the inventor of the phrase, we think, had before him the image of a captive who has escaped with his shackles on him, like Palamon in the *Two Noble Kinsmen*, or the fugitive slave in Mr. Ansell's well-known picture. Even if he has snapped his chain asunder, he still is not fully free till the last link has been broken from off his limbs. Under *persuade*, the author, perhaps on the ground that he deals only with modern English, does not notice the archaic phrase of *persuading*—i.e. urging, recommending an opinion or an action, as in Acts xix. 8, "Disputing and persuading the things concerning the kingdom of God"; which, by the by, the revisers have altered to "Reasoning and persuading as to the things." So in *Hamlet* we have:—

Hadst thou thy wits, and didst persuade revenge.

Mr. Hodgson lays down that *persuade* "can stand for *advise* only when the advice has carried with it conviction"; and this distinction seems to be observed by good writers when a person is the object, but not always by our older classics when a thing is the object, or when the verb is intransitive, and means to *plead*, as when Isabella in *Measure for Measure* says,

How I persuaded, how I pray'd, and kneel'd.

In the case of Shylock persuasion notoriously failed—

Twenty merchants,  
The duke himself, and the magnificoes,  
Of greatest port, have all persuaded with him;  
But none can drive him from the envious plea  
Of forfeiture, of justice, and his bond.

The author touches upon the abuse of French words and phrases; but the extract he gives on this subject from Hotten's *Slang Dictionary* is, at any rate as regards the phrase "on the tapis," beside the mark. We do not believe that any Frenchman who was told that a marriage was on the *tapis* would "look down on the carpet" for it, because *tapis* may equally well mean, and in that idiom does mean, the table-cloth. "On the carpet" can only be held a fair translation when we remember that carpet once had the same double sense of floor-cloth and table-cloth.

As we have said, we could easily extend the author's list of Malapropisms. *Transpire* and *ovation* should have places in it; also *paraphernalia*, which we have seen used for *ceremony*. The exact meaning at present attached to *phase* should be inquired into. The word used to be connected with the moon and the tides; but now, with the fine writers of the country newspapers, it seems to have something to do with cases of kicking and wife-beating, which they love to call "phases of modern life." For the benefit of Lancashire folk an explanation might be given of the nature of a *parapet*, which in that part of the world is, even by educated people, taken to mean the footway. There is a growing tendency, which ought to be checked, to misapply the word *supposed*, sometimes as if it meant *expected* or *required*, sometimes as if it stood for *intended*. An *employé*—we use the jargon of the period—when questioned in the witness-box about the method of conducting business in the shop or the office to which he belongs,

will answer, if the question relates to something outside the line of his own work. "I am not supposed to know that," meaning that it is no part of his business to know it. In a man who begins by calling himself an *employee* this is in keeping; one does not demand Christian English from him. But we were surprised, on glancing over the official prospectus of the new University College, Liverpool, to read that "A Professor is supposed to be resident in Liverpool," the meaning, from the context, being that it is intended that he shall so reside. We hope that the hypothetical professor may be able to give lessons in English composition.

We have wandered away from our book, and have only gone through the first of its four divisions. In the second part, on "Accidence," we are glad to see that the author supports the accurate and Johnsonian, but rather puzzling, expression, "I gave no more than I could help," against the illogical "I gave no more than I could help." The third part, "Syntax," has a useful section on "collocation" or order of words, which so often baffles writers who are far above such mistakes as we have hitherto been dealing with. On this subject we cannot now enlarge, but we must quote a few choice specimens of disorder. "He blew out his brains after bidding his wife goodbye with a gun"—an extract from a Connecticut paper—is pleasing; and there is a fine Irish flavour in the Ulster epitaph, "Erected to the memory of John Phillips accidentally shot as a mark of affection by his brother." But the gem of the collection is an advertisement from an English paper, "A piano for sale by a lady about to cross the Channel in an oak case with carved legs." With this we take our leave of the book, which will certainly amuse its readers, and will probably teach them a good deal which they did not know, or at least never thought about, before.

#### AN ELEMENTARY TREATISE ON ELECTRICITY.\*

IT appears that the late Professor Clerk Maxwell left behind him, amongst other MSS., some papers intended to form part of an elementary treatise on electricity. The editor of the present work has put them together, on a plan and under circumstances which he explains in his preface as follows:—

It was for some time under consideration by the friends of Professor Maxwell whether the MS. should be published in its fragmentary form, or whether it should be completed by another hand, so as to carry out, as far as possible, the author's original design; but, before any decision had been arrived at, it was suggested that the book might be made to serve the purposes of students by a selection of Articles from Professor Maxwell's *Electricity and Magnetism*, so as to make it, in a sense, complete for the portion of the subject covered by the first volume of the last-mentioned work.

In our opinion this suggestion was by no means happy, as may be seen by the results as shown in the book now under consideration, which, in spite of its great value, can in no sense be said to "serve the purposes of students," who, we should say, would find the work absolutely incomprehensible. We should have thought that a competent electrician would have had no difficulty in arranging, amplifying, and explaining these valuable notes of Professor Maxwell's (for they are but little more), and might thus have succeeded in producing a real elementary text-book which students could have understood, and which would have been one of a sort for which there is now much need. All due reverence could have been shown for a valuable literary relic of one of our most celebrated scientific men by distinguishing original from added matter by a difference of type, and passages which it was found desirable to rewrite might have been preserved in footnotes or in an appendix. Such amplification and explanation are somewhat needed in the actual materials of the proposed elementary text-book, and are absolutely necessary in any articles taken from *Electricity and Magnetism* for the purpose of completing the work. *Electricity and Magnetism* was written for advanced electricians, and is some of the most difficult reading in the whole literature of science, even to those who have the advantage of considerable mathematical training; and even its easiest passages are by no means of a nature to "serve the purposes of students," but are more of the nature of intellectual pemmican—to use a very happy phrase of Professor Huxley's—than of intellectual beef-tea, which is the kind of mental food best suited for the brains of students.

Mr. Garnett, however, in spite of his long connexion with the Cavendish Laboratory under Professor Maxwell, has not apparently cared to take upon himself the responsibility of acting as the author's interpreter, and has carried his reverence for the original text to so high a degree as not even to have ventured to change one or two words, even where such a change would certainly have been made by the writer before passing the book for press; as, for instance, in the following passage:—"There is nothing in this case to which we can apply the term 'flow' which we apply to the case of the transmission of heat with the same propriety that we apply it to the case of a current of electricity, of water, or of time itself"—where the exercise of a very little literary ingenuity would have prevented the impression that Professor Clerk Maxwell could by any chance write of a "current of time."

We have said that had these materials been used to produce a true elementary text-book it would have supplied a great want. Up to the present time the teaching of electricity to those who have not very high mathematical attainments has been, for the most part, carried on by means of analogies and provisional hypotheses, varying from one part of the subject to another, often contradictory one of the other, and all having a tendency to lead the student to have more or less belief in "the electric fluid"—a curious product of the inner consciousness of early electricians, which, whilst appearing to do its work as a *memoria technica* for some electrical phenomena fairly well, has yet done incalculable mischief to the spread of sound knowledge on the subject of electricity. We may here quote Professor Maxwell's words on the subject, which occur early in the present book:—

And here we may introduce once for all the common phrase, *The Electric Fluid*, for the purpose of warning our readers against it. It is one of those phrases which, having been at one time used to denote an observed fact, was immediately taken up by the public to connote a whole system of imaginary knowledge. As long as we do not know whether positive electricity, or negative, or both should be called a substance, or the absence of a substance, and as long as we do not know whether the velocity of an electric current is to be measured by hundreds of thousands of miles in a second or by a hundredth of an inch in an hour, or even whether the current flows from positive to negative or in the reverse direction, we must avoid speaking of the electric fluid.

The only way to teach the subject when we have cast from us that unclear thing, the electric fluid, is to treat electricity purely as a branch of the science of energy. It is, no doubt, difficult to do this without the help of refined mathematical methods; but in these notes and materials Professor Maxwell shows that it is quite possible to do so by making use of methods analogous to those used with such great success by Faraday, which, whilst really mathematical in form, do not require for their right understanding any very deep knowledge of mathematical symbolism and machinery.

We would recommend to the notice of those who love to start hypotheses as to the true nature of electricity, and air the same with much heat of temper and reviling of objectors, the plain confession of ignorance contained in the passage which we have quoted above, and to beg them, whilst reading and studying it, to remember that probably Clerk Maxwell, by his so-called electromagnetic theory of light and by his other researches, has done more than any one else who has yet lived towards clearing the way for the formation of a true physical theory of electricity. Until this has been found we are in the dark, and must walk cautiously and always hold fast by our only guide, the conservation of energy, of which Professor Maxwell says:—

The progress of physical science has led to the investigation of different forms of energy, and to the establishment of the doctrine that all material systems may be regarded as conservative systems, provided that all the different forms of energy are taken into account. This doctrine, of course, considered as a deduction from experiment, can assert no more than that no instance of a non-conservative system has hitherto been discovered; but as a scientific or science-producing doctrine it is always acquiring additional credibility from the constantly increasing number of deductions which have been drawn from it, which are found in all cases to be verified. In fact, this doctrine is the one generalized statement which is found to be consistent with fact, not in one physical science but in all. When once apprehended, it furnishes to the physical inquirer a principle on which he may hang every known law relating to physical actions, and by which he may be put in the way to discover the relations of such actions in new branches of science.

The doctrine of the conservation of energy having taken its rise from the theory of heat, particularly from what is known as the "first law of thermodynamics," as its necessary supplement, the doctrine of the dissipation of energy may be said to be based upon "the second law of thermodynamics." The best way to get a clear grasp of these important generalizations is by the study of the theory of heat; so that the best training for the student of electricity is a good grounding in the older and better understood science.

It is of the utmost importance at the present day that sound and trustworthy teaching should be given in electrical science. The practical applications of electricity to industrial processes of late years has given rise to a great demand for professional electricians, and whilst we fully recognize the value of a practical training in their case, yet it must always be remembered that advance either in the science or the art of electricity can only be made by men who thoroughly understand all that is known of the theory.

The subject of the alliance between electrical theory and the practical application of the science naturally suggests the Ohm, or British Association unit of electrical resistance, which has played so important a part in practical work, and has also, with its allied units of electromotive force, &c., done so much for fixing and establishing scientific electrical knowledge. In one of the articles from *Electricity and Magnetism* used to complete the present book, Maxwell points out how difficult an operation the determining of this unit is; and the truth of his remarks has been fully shown by recent experiments carried out at the Cavendish Laboratory at Cambridge by Lord Rayleigh, Dr. Schuster, and others. The original apparatus used by the Committee of the British Association was some time ago deposited in the Laboratory, and was erected and arranged for a fresh determination, under the direction, we believe, of Mr. Horace Darwin. The result of careful experiments went to show that the correction for one of the most disturbing elements—that due to the "self-induction" of the rotating ring of wire which generates a current under the influence of the earth's magnetism—had been taken at too low a rate; and the new determination gives a value for the Ohm 1.05 per cent. higher than that found by the brilliant

\* *An Elementary Treatise on Electricity*. By James Clerk Maxwell, M.A., LL.D. Edin., D.C.L., F.R.SS. London and Edinburgh, Honorary Fellow of Trinity College, and Professor of Experimental Physics in the University of Cambridge. Edited by William Garnett, M.A., formerly Fellow of St. John's College, Cambridge. Oxford: at the Clarendon Press. 1881.

assembly of physicists who formed the Committee of the British Association. This new result need not alarm electrical engineers. The standard unit of resistance will still remain the standard coil prepared by the British Association Committee. It will no more be changed, as Maxwell points out, than the value of the metre was changed when it was found out that the standard metre at Paris did not represent the ten-millionth part of the arc of the Paris meridian from the Pole to the Equator, as it was intended that it should do.

To return to the book under consideration, it is undoubtedly of the very highest interest and value to electricians, particularly to those who have acquired their knowledge of the science without the aid of mathematics. It is one which every teacher should study deeply, but one which most students will either not understand at all, or will misunderstand to their own undoing. All who hope to find *An Elementary Treatise on Electricity* to be a work resembling the author's lucid text-book on Heat will be, we fear, grievously disappointed; and the treatment which Professor Maxwell's materials have received at the hands of his literary executors and the editor of this book gives another cause of regret that the great physicist did not live to complete his labours.

#### COURT NETHERLEIGH.\*

WE know few harder pieces of work than to make a fair start in reading one of Mrs. Henry Wood's novels. She always has a host of grand people and criminals to get introduced to us, and she is very ill-fitted for discharging the duties which belong to a Master of the Ceremonies. She brings them on to her stage with as little regard to propriety as if they were a mob of citizens in one of Shakespeare's historical plays. No time is given us to distinguish one from the other, and we are for a long while hopelessly confused in the midst of her crowd of characters, and are always mistaking the sinners for the saints, and the saints for the sinners. We might compare her opening chapters to an old-fashioned French diligence just making its start, on which, by some freak of fortune, all the passengers chanced to be people of title, or at all events people of wealth, each travelling with a large amount of luggage, and each attended by a valet or a lady's-maid. To add to the difficulties of the start, a long steep hill should face the overladen diligence. When at length the great people had taken their places, their packages had been safely stowed away, and their servants had climbed up behind, still a vast effort would be required to get the huge machine fairly into motion. For a long time the pace would be slow and tedious, and it would not be till the brow of the hill had been reached—almost till the descent had begun—that a fair speed would be attained and an air of cheerfulness and of hope would be spread over the company that had found itself so strangely brought together. We once knew a worthy old merchant who for many a year went by omnibus into the City six mornings in every week. When they came to a certain hill, and the horses began to tug at the load, the old gentleman, with a pleasant smile, as if a joke, and a new joke, and a good joke, had suddenly struck him, would say to any stranger who sat opposite to him, and, if fortune did not grant him a stranger, to one of his old cronies—"Plenty of collar-work here, sir!" We never saw the point of the jest, but we caught the smile, and were always ready with one in return, and with a nod of assent too. Now, as we were reading the first volume of this novel, and as the comparison came into our mind between it and the diligence, at once the old joke, which we had not heard for many a long day, came back to our thoughts, and we found ourselves repeating, "Plenty of collar-work here, sir." The strain certainly was unusually great, for the load that Mrs. Henry Wood started with was enormous even for her. We thought it almost impossible that we should ever get to the top of the ascent, and once or twice we gave it up as a bad job. We must do her the justice to admit that, when she had at last reached it by an effort that was almost prodigious, and had travelled over a dreary waste of flat country, the pace downhill was really very good. It is true that we got rid of a few heavy sinners on the way; but then, on the other hand, some kept their places and got converted. Now, whatever merits in other respects the penitent may have over the impenitent, yet in a novel of the kind before us it must be admitted that a sinner by becoming a saint does not add to its lightness. Moreover, the places of those who were left behind were soon filled up, and filled up, too, by passengers who in rank, fortune, and general heaviness came nothing short of those who had been present at the first start.

Among all the ladies of rank or of wealth who adorn this story, it is not very easy to decide which is the heroine. In one volume we were inclined to assign the chief place to one young lady, and in another volume to another. Perhaps the safest plan was to turn to the last few chapters and see who among them pulls out the biggest plum from what we may perhaps be allowed to call the Christmas-pie of life. But here we were puzzled. For one young lady whose lover a coroner's inquest had pronounced dead long ago (and he had certainly been last seen on the parapet of Westminster Bridge, a ruined gambler and a swindler) finds him turn up suddenly a virtuous character, with a fortune of at least half a million sterling. On the other hand, another young lady, not a mere commoner as the other, but an earl's daughter and

the wife of almost the richest merchant in London, is suddenly reconciled to her husband, from whom she had been long separated, and finds that he is no longer plain Mr. Grubb, but Sir Francis Netherleigh, Baronet, with a fine old estate of 15,000*l.* a year added to his vast possessions. She had been a swindler quite as much as the supposed suicide, and, like him, had misappropriated just 500*l.* She had been guilty of forgery, he of embezzlement. He had very nearly thrown himself into the Thames, and she had very nearly gone into a poor sisterhood. Both had become very penitent and very rich. He had won a bride who had never ceased mourning his loss, and she had recovered her husband. Between the claims of heroines such as these the most experienced novel-reader might find it difficult to arbitrate. On the whole, it seems the safer course to give due precedence to rank, and to allow an earl's daughter and baronet's wife to take the lead. We shall, therefore, follow chiefly the fortunes of the Lady Adela Chenevix. Her father, the Earl of Acorn, is introduced to us "as he scowls his eyebrows, and presses his lips, and motions with his hand as he paces in his library communing with himself." *Scowls*, by the way, has hitherto been a neuter verb; but a little irregularity in grammar, or in anything else, may be allowed when an author is dealing with the aristocracy. Every one could have seen at once from these strange actions that the Earl was over head and ears in debt, even if the author had not taken the trouble to inform us that he had wasted his princely income. A cab whirls along in the street. Can a cab, by the way, be ever said to whirl, except when the driver is drunk, or the horse insists on turning round and round? But at this rate, stopping each moment to inquire whether Mrs. Wood's words have any particular meaning, we shall never get past the Earl and reach the Earl's daughter. The cab, then, "whirls along, and pulls up before the steps and the stately pillars of Chenevix House." From this it is clear that the steps and the pillars were in the same part of the house. Whatever irregularity there might have been in his lordship's conduct, in the style of the architecture of his town house there was nothing eccentric. "A knock and a ring send their echoes through the mansion." Surely, says the reader, in spite of the cab, some great personage must be at hand. It is only a dun, as the Earl ascertains by standing with his ear at the half-opened door, and listening to the talk that went on in the hall between the porter on the one hand and the stranger on the other. "What!" says our author in honest indignation, "a peer condescend to play eaves-dropper, in an attitude that befits a mean man?" Whether, however, her indignation is chiefly due to his eaves-dropping or to his attitude is not quite clear.

In a few touches we have had brought home to us the hopeless embarrassment of this nobleman, and we are now quite prepared for the introduction of an honest, wealthy merchant, who is deeply in love with one of the nobleman's numerous daughters. He quickly appears in the person of the hero, Mr. Francis Grubb. "Do not be prejudiced against him on account of his name, reader," writes our author; "but pay attention to him, for he is worthy of it, and he plays a prominent part in this little history. He is thirty years of age, a tall, slender, noble-looking man, with intellect stamped on his ample forehead. . . . His grey-blue eyes are simply beautiful." He had finished his education at Christ Church, and there had become intimate with the Earl's only son. This young gentleman was merely needed to help to introduce his friend into his father's family. That being done, he had been killed off with all promptitude. On Mr. Grubb's purse the Earl had largely drawn. By way of return for all the money that was due to him, the merchant now came suddenly to ask for the hand of Lady Adela. "His lordship was considerably startled: the proud Chenevix blood rose, and dyed his forehead crimson." He had, however, to yield, for his circumstances were otherwise desperate. Not so easily was his daughter's consent won; she only yielded to necessity, and to her mother's warning that, if she refused, and Mr. Grubb and the other creditors pressed her father hard, the whole family would have to go abroad "and lodge on one dirty floor of six rooms, and live as common people." She received, then, Mr. Grubb as her lover. "He stood in agitation at the upper end of the room—a fine intellectual man; one, young though he was, to be venerated and loved. She wore a pink and white silk dress, and her hair had pink and white roses in it." The contrast seems somewhat imperfectly drawn between his character and her dress; but then he had come to dinner, and so his clothes scarcely admitted of description. She treats him with worse than coldness. When, later on, one of her sisters speaks of his evident love for her, "Love!" cried she. "It is perfectly absurd—from him to me. But it is the way with those plebeians." She ought to have been happy, for she had in abundance from the very beginning those rewards which in such stories as these are generally bestowed only in the end. "Settlements, carriages, houses, furniture, ornaments, jewellery, all were perfect of their kind, leaving nothing to be wished for." Her husband, moreover, had been "fortunate enough to secure and purchase the lease of a house within the aristocratic regions of Grosvenor Square." Nevertheless she refused to be happy. Her new name was too much for her to bear. She could never bear herself announced "Lady Adela Grubb" but she shivered. The sight of the *Morning Post* ceased to be a source of consolation and joy, for there she read the hated name. "Bless my heart and mind," said her sister, the Lady Sarah, "what's in a name?" "Grubb! Grubb!" hissed Adela from between her dainty lips. *Grubb*, by the way, is not a word that can be hissed even by an earl's daughter. She led her hus-

\* *Court Netherleigh*. A Novel. By Mrs. Henry Wood, Author of "East Lynne," "The Channings," &c. 3 vols. London: Bentley & Son.

band a miserable life. She flung a cup of coffee in his face. She took to flirting and to gambling. She lost large sums of money at cards, and she forged the name of his commercial house to a cheque. She allowed the blame to fall on an innocent man, who was arrested and lodged in Newgate. In the end she becomes, of course, very penitent, and gets reconciled to her husband, from whom she had been long separated; and is rewarded for her sufferings by finding, as we have said, that there is no longer a Mr. Grubb, but in his place a Sir Francis Netherleigh. Let us hope that the *Morning Post* once more afforded her pleasant reading.

We have no space to follow at any length the fortunes of the other characters. The adventures of the gentleman who was found dead by crowner's law are not wanting in excitement. He had, indeed, only tried to kill himself, but he succeeded by a mischance in shooting his own father. His father's only brother had some years earlier cut his own throat. The life of the supposed suicide's sister is not without attraction for a certain class of minds. In her first season in London after her marriage we are told that "Peers were going mad for her smiles; peeresses condescended to court them. Panics do sometimes come over the fashionable world of this great metropolis," adds our author. "At the time of which we are writing it was the admiration of one of themselves, a woman, the beautiful Mrs. Dalrymple." How a beautiful woman could be a panic we shall only know when Mrs. Wood condescends to publish a glossary to her works. As the bride came in like a panic, so she faded away like "a wreathing (sic) cloud" and "like a bright vision." Meanwhile, she had done Mrs. Wood and her admirers one good turn. She had afforded an admirable opportunity for a great display of the vulgarity of wealth. In particular, there is a long description, filling many pages, of a fashionable dressmaker which ought to be read with the liveliest satisfaction by all the milliner's assistants and ladies'-maids in London. What a pleasure they will have in learning that this dashing young lady of the panic ran up a bill in one season of not much less than four thousand pounds for dresses alone! Those readers of this story who delight in economy, if there are any such, will be somewhat pleased to find, at all events, one exception to this extravagance. Among all the rich people who abound in *Court Netherleigh* was an old Colonel. We are, once in the first volume and again in the second, impressively informed that, wealthy though he was, he wore a black ribbon across his waistcoat in lieu of a gold chain.

Foolish and odious as are the vulgar descriptions of luxury and wealth which are to be found scattered through every volume of this novel, we should not find them quite so distasteful could Mrs. Wood keep clear altogether of pious effusions. We might forgive her characters their viciousness and their worship of money. We cannot forgive them their penitence and their piety. Those who gaze with open-eyed admiration, and even envy, at the purple and fine linen of Dives would be not the less offensive should they now and then for a few moments—a due regard to their gentility, of course, being preserved—mask themselves each as a modern Lazarus.

#### AMONG THE SONS OF HAN.\*

THIS work might more appropriately have been entitled "Among the Sons of Britain in the Land of Han," since the point of view from which the "Sons of Han" are regarded is that of a lady looking out on the corners of the Empire from the verandahs, as it were, of English houses and the steam launches of British merchants. We say this in no disparage of the book, for by so doing we only express in other words Mrs. Hughes's own account of its aims and scope. All she claims for it is that it describes faithfully the "incidents, more or less interesting, which came under her own personal observation whilst accompanying her husband on his travels." We frankly admit all that she thus claims, and having conscientiously read through her book we are prepared to add that from the first page to the last it is well and brightly written, and that the incidents are sufficiently interesting to make it a readable volume.

The overland route has been so often described, that probably most of Mrs. Hughes's readers will skip over the first chapter, even at the expense of missing the gratifying contrast drawn in it between the depressing aspect of Saigon and the surroundings of the rival English colony of Hong Kong. At this place the author's stay was scarcely long enough to accustom her to being carried in sedan-chairs raised to a level with the shoulders of the coolies who bore her along; and at Shanghai, where she next halted on her way to Chefoo, the greater part of the few days at her disposal were devoted to surrounding herself with the staff of servants necessary for the maintenance of a household in China. The interviews of ladies in England with servants applying for situations are often, as Mr. Du Maurier delights to show us, ridiculous enough, but nothing can exceed the apparent absurdity of the parallel process in China, when questions are put and answered in "pidgin" English, except, perhaps, the folly of the people who will persist in using such a monstrous perversion of language. No wonder Mrs. Hughes thought the jargon "excessively childish," and for a long time found it difficult, when giving her orders, to disguise her mother-tongue in such gibberish as this:—"Boy, I wantsee you chop-

chop go topside catchee my one piecey book; supposey no can find that side, maskee." For six years, however, this was the only medium through which Mrs. Hughes was able to communicate with the "Sons of Han." And it would even appear that time overcame her objections to its use; for afterwards, when in Formosa, she expresses her delight at finding a coolie who could speak English. Remembering what his "English" was, we should not have been inclined, had we been in the author's position, to exchange "the straight, strong, and tolerably clean-looking" Chinaman, who spoke nothing but his own language, for the pidgin-English-speaking coolie.

Mrs. Hughes visited several of the ports, and probably saw as much of the natives as falls to the lot of most residents in China. She dined with them, and tried to appear as though she liked shark's fins, Sze-chuen fungi, bêche-de-mer, and other Eastern delicacies; she visited their theatres, and listened patiently to the shrill voices of the actors without understanding a word that was said, and submitted to have her ears deafened by the conventional clashing of cymbals and beatings of gongs; and she "assisted" at a wedding at which she was not only allowed to see the bride's face, but even to inspect her trousseau. But this formal side of Chinese life pleased her less than the unceremonious habits of the people. Chinamen are in the habit of eating largely at dinners, savoury and greasy morsels are apt to slip from the chop-sticks on to the table, the laps of the diners, or floor; sauces also are often spilt, until towards the end of the meal neither tables nor feasters are very sightly objects. Nor are matters much improved by the appearance of the usual "dirty-looking wooden pail full of steaming hot water and a dark coarse cloth, which latter the mandarins," on the occasion of which Mrs. Hughes speaks, "whilst seated at table, each in turn dipped in the water, and then mopped their unctuous faces in the most unconcerned manner." Chinese theatricals, again, are so unlike our own, not only in the arrangements of the building, but in the acting and substance of the plays, that even to foreigners who understand the language they are dreary, if not, as they often are, indecent, performances. Their weddings, too, are to the uninstructed more curious than entertaining, and we can quite understand Mrs. Hughes's desire to leave early at the marriage she describes, after having wearied herself with watching the unintelligible formalities, and the endless bowings and prostrations of the bride and bridegroom before the blank wall which appeared to her to be the object of their adoration.

But for the Chinamen in their work-a-day clothes she has a sincere regard. They "invariably appeared kind and good-humoured, and so far from receiving any rudeness or incivility at their hands," she was ever "treated by them with respect and studied politeness":—

I remember on one occasion [she adds], passing the cottage of a poor man who showed great taste in the arrangement of flowers in pots around his door. One exceedingly good specimen of an aster had a particular attraction for me on account of the delicacy of its hues, and by my gesture I expressed my admiration to the owner. The old man seemed pleased with my approval of his pet, and I proceeded on my walk; I had forgotten all about the circumstance when, to my surprise and delight, I found on my return home the very aster I had admired, pot and all—a present from an old Chinaman whom I had never seen before.

That there is no lack of affection among them she has abundant evidence to prove, and she describes with some force the intense grief of a Chinese mother on the death of her baby. It is as well to bear such cases as this in mind when we read of foreigners being stoned, robbed, assaulted, and sometimes killed in the interior of the country for no other offence than that they are not Chinamen, and of the existence of such notices as the following, which stands at the edge of a pond near Foochow, "Girls are not to be drowned here." But the fact is that among Chinamen, as among all people of a low civilization, the same natures are capable of great kindness and of savage brutality, of excessive affection and of cold-blooded cruelty. Their moral faculties are not sufficiently developed to enable them to hold a just balance between right and wrong, and the consequence is that the impulse of the moment is their only guide. Some of the most cruel murders which disgraced the Indian Mutiny were committed by men who had previously been on intimate and friendly terms with their victims. And so it must always be among half-civilized peoples; it requires but the inflammatory action of fanaticism or the passion of self-interest to curdle the kindest natures, and to make them relentless and cruel.

However, to Mrs. Hughes was shown only the golden side of the shield, and we are quite content to forget with her that there is such a thing as a reverse to it. Of Buddhist priests alone she speaks with some disparagement. But as these servants of Buddha are considered fair game by Chinese novelists, playwrights, and ballad-writers, there is no reason why a stranger should not also join in the chorus of contemptuous ridicule. In appearance they are, as a rule, dirty and forbidding-looking; their ignorance is notorious, and their habits of life are in open violation of the laws of the founder of their faith. But though by long habitude they swallow camels without an effort, they yet on occasions have the decency to strain at gnats, as the following incident at a picnic in a Buddhist temple, narrated by Mrs. Hughes, shows:—

One of the priests [writes the author] was evidently of opinion that the sight of so many unbelievers devouring viands, some of which were prohibited according to the ancient ordinances of Buddha, was not a proper one to meet the eyes of their idol; for, no sooner had we commenced our meal, than the holy man hung up a piece of red cloth, in the manner of a screen, before the face of the gilded image. The priests must have really believed that their own actions were no longer visible to their deified patron, for on our presenting them with some champagne they each sipped a little

\* *Among the Sons of Han: Notes of a Six Years' Residence in various Parts of China and Formosa.* By Mrs. Thomas Francis Hughes. London: Tinsley Brothers. 1881.

in turn, passing the forbidden liquid on from hand to hand with many a leer and wink, and with much smacking of lips, as if they appreciated it thoroughly. One very pious old gentleman put down his beads to clasp with both hands a half-empty bottle which was given him, and with a shy glance up at the red curtain to make sure that the idol was not peeping, he applied the bottle to his holy lips, nor did he remove it until it was quite empty.

It is difficult to imagine a scene more out of harmony with the teachings of Sakya-Muni than this. Self-restraint and victory over the appetites were the cardinal points of his doctrine; self-indulgence and gluttony are the characteristics of these his degraded followers. Even the existence of the idol is one of the "blank blasphemies of Chinese Buddhism" which have tended to reduce a pure and lofty faith to the level of a superstitious idolatry. A fitting pendant to this scene was an episode witnessed by Mrs. Hughes at another "Joss-house," where a woman, after praying earnestly and burning several "joss-sticks" before the shrine of the God of Earth, played a game of pitch and toss with the deity in such a way as to determine by the fall of the coin which were the lucky words to choose in an impending gambling lottery. It is impossible to reach a lower depth of superstition than this, and it is a curious instance of the hold that the supernatural has on the human mind that in a country where atheistic Confucianism is the professed creed of every one who can read the "Four Books" and "Five Classics," there should exist and flourish a system so grossly superstitious as Chinese Buddhism. Unlike those fairies whose touch is said to convert the most worthless substances into the purest gold, the Chinese no sooner come into contact with pure and spiritual ideas than they so materialize and degrade them that they lose all trace of their original semblance. It has been so with the tenets of Buddhism and Taoism, and it remains to be seen whether those of Christianity will fare any better at their hands.

With such considerations, however, Mrs. Hughes does not trouble herself. She prefers to skim lightly over the surface of her subject, and to leave to others the task of cross-examining her facts, and of demanding from them the why and wherefore of their existence. Such book-making is easy work, though it must be confessed that it does not tend to increase our existing stock of knowledge. Indeed, if the present work were not so pleasantly written, we should be inclined to ask why it was written at all. It is impossible to gather from it any definite idea either about the country or the people. It is merely a sketchy diary of a six years' residence in China, but as such it is worth reading.

#### ALL SAINTS, DERBY.\*

NEITHER the chief author nor the subject-matter of this book is unfamiliar to us, as we have already reviewed the four volumes, full of valuable matter, upon the Churches of Derbyshire, successively published by Mr. Cox, while in our notice we followed the writer's own example in dwelling at considerable length upon All Saints Church, Derby, with a particular reference to the inconceivable Vandalism which made havoc of some of its most interesting features in 1873, under the iconoclastic guidance of an incumbent who has since then received his reward in the way of promotion to one of the best-endowed and most fashionable churches at the West End of London. Remembering what we then said, we are confronted by our reminiscences when we sit down to review the more ample monograph of the same church which Mr. Cox has recently brought out in concert with Mr. St. John Hope, in a handsome and fully illustrated quarto; for, of course, incidents which have been already related as most worthy of commemoration, although they have not by lapse of time become less worthy of record, cannot bear repetition after so short an interval. All Saints, the chief church of Derby—formerly collegiate—is, in its present condition, made up of a noble modern Perpendicular tower, and of a heavy, though rather stately, Italian building, which in 1724 replaced the old structure through the determination of the then vicar, Dr. Hutchinson, an arbitrary and not very scrupulous man, according to our authors, who secured Gibbs as his architect at the moderate (for so eminent an artist) cost of twenty-five pounds, but with the result of feuds and heart-burnings before which he himself succumbed. The building, which is internally divided into nave and aisles by two rows of "Roman Doric" columns, is well proportioned and of sufficient height and width. As at St. Martin's-in-the-Fields and in the church in Vere Street, Gibbs indulged in the barbarism, taken from Spalato, of the architrave cut up, so as to produce the effect of a second capital standing upon the legitimate one. We still find, though sadly disfigured and ruthlessly displaced, the magnificent wrought-iron screens produced by Bakewell, a local worthy; while the *disiecta membra* of the Earl of Devonshire's tomb tell a tale of fanaticism and of neglect incredible in these days, in which all schools are beginning to learn and practise a decent regard for the proprieties of worship and the charm of historical association.

The old collegiate church which fell before Dr. Hutchinson's innovating zeal is thus described:—

From the various little details pertaining to the old fabric that can be gleaned from the Churchwardens' Accounts and Orders, we find that the church used to consist of a nave, wide south aisle, rather narrower north

aisle, chancel, south chancel chapel, which was an extension of the south aisle, and large south porch with windows on each side, and a vestry, which we believe opened out of the chancel on the north side.

Moreover, we are told, upon the authority of an old painting of the time of James II., that the chancel was gabled, and was lighted by a seven-light Perpendicular east window; and that the south chancel aisle, or "quire of St. Katharine," had also a gable and a good Decorated window of six lights. The more narrow north chancel also apparently possessed only a lean-to roof.

The exact age of the magnificent panelled tower—50 feet square at the base, and 40 at the top, with a height of 178 feet—has not been fully ascertained. We are informed that

various conflicting statements have been made with respect to the exact age of this grand tower, some assigning it to as late a date as the reign of Queen Mary; but the truth is that the process of building, like so many of the best masterpieces of Gothic art, was a slow one, and that its erection extended over a considerable period. Fortunately we are able to give some interesting documentary evidence, hitherto unknown and unpublished, on this very point. From the first volume of the Churchwardens' minute books (which begin in the year 1465) we gather that the works of the tower were in progress in the second year of Henry VIII. (1510-11).

The next entry, it seems, occurs some ten years later; while the accounts of 1527 show that a Derby dyer, named Robert Liverseye, founder two years afterwards of an important charity, was also a munificent benefactor to this steeple.

The patronage of All Saints Church, which belonged before the Reformation to the Dean of Lincoln, passed at that time into the hands of the Corporation of Derby. For a brief space of time during the reign of Queen Anne the pulpit of the old church was famous all over England; for the first of the two sermons for which the turbulent Dr. Sacheverell was made by the Government of his day a clerical martyr, with the characteristic good luck to the prosecutors which ordinarily attends the victimizing of clergymen, was preached on August 15, 1709, in All Saints, Derby. The occasion which led that doughty polemic to fill the pulpit at Derby was that he was chaplain to the High Sheriff of that year, his kinsman, Mr. George Sacheverell, while the sermon, "The Communication of Sin," was published at the request of the grand jury, among whom we find representatives of the old Derbyshire families of Wilmot, FitzHerbert, Beresford, Vernon, Pole, Horton, and—a strange name to occur in so Tory a company—Cavendish.

It must have been some time before the political churchmen of Derby subsided into a condition of decorous calm; for after the death of Queen Anne, in 1715, Mr. Sturges of All Saints prayed publicly for King James, although, after a minute's reflection, he explained that he meant King George. The congregation, we are told, got tumultuous, and the military gentlemen present drew their swords. Poor Mr. Sturges pleaded a slip of the tongue, but he was never again allowed to officiate at All Saints. The authorities no doubt explained to him, as more than a century afterwards the Duke of Wellington did to Mr. Huskisson, that there was no mistake, there could be no mistake, and there should be no mistake. Eleven years passed when All Saints Church again became the scene of strife, though on this occasion civic and not general politics led to the confusion. In the course of the miserable squabbles which characterized its rebuilding the contention between the Mayor, Mr. Bagnold, and Dr. Hutchinson grew so hot that the vicar prosecuted the magistrate for brawling in church, and succeeded in having him fined 37*s.* and costs.

But an incident more strange than any which we have yet recorded took place in the new church within twenty years of its completion. Publicly in All Saints, only a hundred and thirty-six years ago, on Thursday, December 5, 1745, the Roman Mass was said. The book speaks of High Mass, but we can hardly suppose that an army on its march could have carried the apparatus needful for such a celebration. The occasion of this strange event was the occupation of Derby by Prince Charles Edward. The incident speaks well for the conscientiousness of the young Chevalier, or, it may be, for that of his household; but, in face of such an audacious proceeding, it is not to be wondered at that he was disappointed in that sympathy from Englishmen on which he relied for installing his father at St. James's. Mr. Cox conjecturally observes that the Mass must have been said at the marble altar so cruelly desecrated in 1873, when it was torn down and fastened against the wall, with a misunderstood and perverted quotation from Bishop Ridley inscribed upon it. We may assume this altar to have been the site of the ceremony; but in the eyes of a Roman liturgist it was a mere unconsecrated shelf, though most probably used to support the portable altar which was without doubt employed. Our authors describe the monuments and record the epitaphs with great fullness and industry. Among the other relics of the older church still preserved is a wooden effigy, the only one in that material found in that part of England.

By the provisions of the Municipal Corporations Act of 1834 all Church patronage belonging to Corporations—bodies which until the repeal in 1828 of the Test and Corporation Acts were absolutely identified with the Established Church—had to be sold by auction. The purchasers of the advowson of All Saints, Derby, were the Simeon Trustees, and nothing more need, therefore, be said of the complexion of the theology which found favour in its pulpit. But, on looking at the list of vicars for rather more than three hundred years, nothing is so remarkable as the obscurity of the nominees under either régime. The only Bishop who has ever proceeded from this church was Dr. Anderson, formerly Bishop of Rupertland, who was vicar for about a twelvemonth in 1848.

If ever Derbyshire—which has very generously contributed, in order to facilitate the increase of the episcopate, to being, under

\* The *Chronicles of the Collegiate Church or Free Chapel of All Saints, Derby*. By the Rev. J. Charles Cox and W. H. St. John Hope. London and Derby: Betts & Sons. 1881.

Sir Richard Cross's Act, transferred from the old and illustrious see of Lichfield in Staffordshire to the new and tentative one of Southwell in Nottinghamshire—succeeds, as it well deserves, in obtaining a bishop of its own. All Saints Church can certainly never be accepted as his permanent cathedral. With a town thriving and growing like Derby, church extension is a constant necessity. It would therefore be an act of prudent forethought to prepare for the contingency of a see of Derbyshire by providing a new church in the form of a building which might be hereafter the instalment of a cathedral. Granting equal accommodation, and leaving the carved work in block, such a construction need not be more expensive than a completed church of the ordinary parochial type. In itself the enterprise would be less ambitious than the gigantic works actually in progress at St. Alban's and at Truro, with its comparatively small population of ten thousand.

#### THE OLD ABBOT'S ROAD.\*

THERE are certain novels of portentous length which touch our sympathies while they irritate us. As reviewers, however conscientious, we should be more than human were we not fretted by the hard labour to which they condemn us; and yet we remember that the task of writing them must have been far more severe than our own. If a trivial story is obviously worthless, we naturally know neither pity nor remorse. As the case may be, we either throw it aside, or we skip to the best of our ability, feeling that it is impossible to do the author serious injustice. But with such a novel as this it is altogether different. *The Abbot's Road* bears the unmistakable traces of thought and care; in many respects it shows more than average ability; some of the scenes are sufficiently exciting, and most of them are far from dull. To judge the book fairly, we should read it conscientiously; and yet it has the fatal fault of gratuitous tediousness. Miss Alldridge seems to have considerable ambition, but slight skill in construction. Selecting subjects purely domestic, she has gone to work upon a broad canvas that might have suited a grand historical picture, and she has overcrowded it with unimportant characters and a superfluity of minute details. To begin with, she has embraced in her digressive fiction the lives and loves of the people of two generations who happen to have an extensive acquaintance in various circles of society. We are introduced successively to many estimable folk; but our knowledge of them is so exceedingly slight and ephemeral that we are profoundly indifferent to the family histories on which the author is inclined to expatiate. Then, in exercising her own powers of imagination, she will trust little or nothing to ours; so we must follow many parallel lines of closely consecutive narrative, extending over a number of years. It is all the greater pity because by economizing her labour she might have made a very interesting story. As it is, we may assure her readers for their encouragement that the interest increases as the end is drawing near; so much so that, at the risk of appearing inconsistent, we are obliged to criticize the abruptness of the *dénouement*. We can understand that Miss Alldridge may have gradually grown desperate as she felt that her characters had fairly bolted with her, and must be pulled up somewhere and on any terms. Still a coincidence of violent moral revulsions should be avoided, if an author has any regard to psychological probabilities. We can hardly admit that a quartet of sorely tried lovers, who have been either betraying and betrayed or playing at cross-purposes, should soar simultaneously and on the shortest notice into the sublimest spheres of Christian forgiveness. And yet the author does not by any means take a genial view of human nature generally. It is true that there are a brother and sister of singular moral beauty in her story, and these are not only the most engaging, but seem to be the most realistic, of her characters. She appears to assign a monopoly of the practice of virtue to those who are most free from temptation; and her rustics living far from the madding crowd lead for the most part tranquil and reputable lives. One great safeguard they have in belonging chiefly to the Dissenting communions. The Church as the author represents it, although she admits one shining exception to the rule, is in an unholy alliance with the world and the devil. Church members are either neglectful of the teachings they ought to follow or let earnestness degenerate into narrow-minded bigotry. People moving in what is known as society abandon themselves to its insidious seductions; while respectable men of business, when hastening to grow rich, are little better than whitened sepulchres. Yet things, in the novel at least, get somewhat better as the world grows older; and the young people of the second generation are decidedly more estimable than their parents.

The story opens with the loves of young Mr. Bentham and Miss Christie Frome. The pair are supposed to be fondly attached to each other, yet the love seems to be chiefly on the lady's side. We hardly know how the author intends to depict Bentham, unless as the fair-seeming embodiment of a problem that defies even self-examination. Though apparently capable of deep affection, he is nevertheless cold and self-contained; and, if nothing is to be absolutely proved against him, we cannot help feeling that we should be sorry to trust him in matters of business. That he is capable of loving is apparently made clear by his sticking toler-

ably steadfastly to Miss Frome, who has nothing beyond her small salary as a school teacher, though at one time he is on the point of throwing her over. That his conscience is elastic is more than suggested; and besides, had it been otherwise, he would scarcely have got on by acting as jackal to the unscrupulously speculative Mr. Faulkner. We are informed on his own confession, after he has "made his pile," as the Americans say, in partnership with Faulkner, with whom he has quarrelled, that that smoothly-spoken gentleman is a fiend in human form, having legally murdered or driven into lunatic asylums sundry impecunious victims who had the ill-luck to have dealings with him. In truth, while Faulkner was increasing a handsome inheritance by usury, Bentham, who was his confidant and associate, could hardly have kept his hands clean. The third of the trio of parents is Sir Hendrik Van Noorden of Mount Norden, a man of a nature remarkably unprepossessing, though perhaps he is rather weak than wicked. By the assistance of Faulkner, Bentham, and Co., he succeeds in pretty nearly muddling away his property; he quarrels with his young wife, and separates from her; and he alienates the attachment of his daughter Petronella, though she is brought afterwards to give him a kind of contemptuous pity. As what is really a prologue gives us reason to presume, the children of the three households are destined to be more intimately connected than their parents. Petronella, as might have been expected from her upbringing, appears at first sight to be the least promising. She is beautiful, of course, but she is wayward, and what in a filly we should have called sulky and vicious. She seems to care for nothing, except perhaps the memory of a dead sister, and the memory has soured instead of softening her. Nor can we well understand why the elder Mr. Faulkner should have set his heart upon marrying Petronella to his son. No doubt she is heiress apparent to the Mount Norden property; but the property is encumbered almost to its full value, as nobody knows better than himself. He is the last man to value birth without money; as mortgagee he has the heiress almost at his mercy; and yet he manoeuvres for her hand on account of his son, as if she were to bring the youth unembarrassed estates by way of dowry. As for young Mr. Ray Faulkner, he is almost as inscrutable as Mr. Bentham; and as with Mr. Bentham, the author appears never to have made up her own mind about him. He prides himself on precocious cynicism; he behaves at home like an arrant bully to his little brothers and sisters by a second marriage, so that it is no wonder his waspish step-mother should detest him. Although he seldom misses an opportunity of making himself disagreeable to his father, he lets himself be inoculated by the elder man's greed of money; and on one occasion, just before his final transformation scene, he behaves to the girl to whom he is engaged with truculent brutality. Yet he not only shows flashes of a noble nature, but gives proof of something like generous self-abnegation, when he falls in love with Bentham's penniless daughter in place of paying court to the supposed heiress of Mount Norden.

As for Bentham the elder, who was comparatively a respectable man, perhaps he deserved on that account to be blessed in his family. His daughter Chrissie, named after her mother, was what we should pronounce an exceedingly nice girl. She is ladylike and unassuming, though sprightly; she sings sweetly, and is quite pretty enough to explain her making a conquest of Ray Faulkner. But her brother Hugh, in every sense, and in all seriousness, is infinitely the best character in the story, although he is undoubtedly the sort of mystically minded hero whom a woman would imagine rather than a man. He was a dreamy boy of decided, though fantastic, genius. He was thoughtful beyond his years, and addicted to those quaint speeches, pregnant with significance, which indirectly, at all events in novels, portend an early death. He is sure to do nothing well which he does not go about with enthusiasm, and his father, though an eminently practical man of business, has the good sense not to cross his son's bent. Hugh begins with an infatuation for art. The lad's visits to the country, where he goes in search of subjects for his brush, give the author many opportunities for those descriptions of scenery in which she excels. Could Hugh have transferred to canvas her fresh and pleasing pictures of the woods and farmsteadings that must lie somewhere in the Weald of Kent along "the Abbot's Road," and in what she has christened the "Land of Oasts," he would doubtless have made his fortune among the dealers. But Providence has designed him for a different mission. Among the Kentish oast-houses he falls in with the good folks of the Methodist connexion, to which his mother had belonged. They have the shrewdness to discern that he has a call as a preacher; and, though he breaks ground at first with diffidence and reluctance, he finds he has the gifts of a heaven-sent orator. Some of the sketches of the young enthusiast when in his impassioned and exalted moods are really very fine. He feels so intensely that, with the winning charm of his eloquence, he speaks to the very hearts of his audience. The most marvellous instance of this is when he moves a young lady whom chance, or something else, has guided to his chapel. The young lady is no other than our old acquaintance Petronella, who, having lost her father, has withdrawn temporarily from a world with which she is more disgusted than ever. Hugh follows up his first success with a zeal which loses nothing by the fact that he admires her passionately. He soothes her bruised spirit, and directs her to unsuspected sources of consolation, till in very gratitude she must give her love to the man who has opened to her new prospects of transcendent happiness. Had Hugh possessed the means to marry her then and there, all might have been well. But they must wait, unfortu-

\* *The Old Abbot's Road*. By Lizzie Alldridge, Author of "By Love and Law," &c. London: Clarke & Co. 1881.

nately, and they drift asunder. Miss Van Noorden is transferred for a time to society that naturally looks down on the humble artist and minister, who was certainly ineligible from a worldly point of view. But the young friend of Petronella, who has been most indefatigable in breaking off the engagement, has gone to work from purely sectarian motives, loathing Hugh as a minister of Dissent. Meantime Ray Faulkner, who had plighted his faith to Hugh's sister, has simultaneously left that young woman in the lurch; and next, adding insult to injury, has positively gone and engaged himself to Petronella. She, as she subsequently explains, when humbling herself in remorseful penitence to Hugh, had given the young minister his dismissal mainly out of consideration for him. When she appeared most cruel and cold she had been painfully acting a part, and certainly she had not only acted, but overacted it. However, she decides at the last moment that it would be wedding misery if she were united to Mr. Faulkner; and Ray, after threatening her savagely and swearing that he holds her to her troth, rushes away in search of the deserted Chrissie. Though he finds Chrissie at the point of death, his return proves the most effectual of possible restoratives; while the much-forgiving Hugh is made more blissful than ever when clasping his Petronella once more in his arms. Had Miss Alldridge concentrated her work on that particular couple, we believe she would have given us a far better novel.

#### CHRISTMAS BOOKS.

III.

**OLD and New Edinburgh** (James Grant. Cassell and Co.)—“Edinburgh would be a delightful place if it were not Edinburgh,” Lord Dundreary is said to have remarked. Edinburgh, if we may believe Mr. Grant, and the artists who illustrate his book, was a very nice place before it was Edinburgh. The frontispiece of the work represents an extremely pleasing landscape, “The North Loch,” with a church in the middle distance, and the Pentlands behind. The North Loch, unless we are mistaken, is now Princes Street Gardens, and railways, streets, and villas cover the smiling landscape. Mr. Grant thinks that Edinburgh owes its origin to “the hardy warriors of the Gadoni,” who “raised some rude rampart on the precipitous cliffs of the Castle rock.” The illustrations in this book are rather casually introduced. We find the “Maiden,” that early guillotine, on p. 3, and the “White Horse Inn” on p. 4, where we might expect still to be among the hardy warriors of the Gadoni. But, as Cicero said of Athens, every stone you tread on in Edinburgh is historical, and all the Old Town is full of romantic memories of the Stuarts. Mr. Grant has written a very interesting book. He starts from the silent evidence of graves and cairns, of bronze swords, elf-arrows, gold torques, and clay urns, found on ancient Scottish sites, and still eloquent of antiquity. On the slopes of Arthur's Seat, he says, “may still be seen the traces of ancient civilization, in some now forgotten mode of cultivating the soil, forgotten unless we recall the terraces of the Jthine, or the ancient parallels of the Peruvians in the Cordilleras of the Andes.” Terrace-cultivation, with its walls and watercourses, is as familiar to the people of the Riviera as to the natives of New Caledonia; but it is certainly curious to find traces of this form of agriculture on Arthur's Seat. Mr. Grant's book ranges from the buried civilizations to the anecdotes of yesterday, and every page contains a legend of old broils and duels, and trials for witchcraft, tales of old judges, robbers, poets, taverners. The volume is most copiously illustrated, and (p. 115) we have a sketch of the very lantern used by the notorious Deacon Brodie in his double craft of cabinet-maker and burglar.

**From Eye to Heart** (J. E. S. Rothwell. Chapman and Hall, Limited) contains a number of rather pretty photographs from pictures and a quantity of verses. In quoting, as from Byron, “Go, pretty book, from this my solitude,” and so on, Mr. Rothwell seems to have forgotten that Byron says the lines are Southey's, and implores the world not to take them for his own. Mr. Rothwell publishes some verses of his own which are not quite worthy of the company in which they find themselves.

**Illustrated British Ballads** (Cassell, Petter, and Co.)—Mr. G. B. Smith is the editor of these handsome volumes. He finds that the task of selecting ballads is “like gathering a nosegay in a garden overflowing with floral riches.” “Overflowing with floral riches” is good, but Mr. Smith has certainly not caught his style from the poets with whom he has been living. Among “ballads” he includes, not only traditional *volks-lieder*, but the compositions of Mr. Mortimer Collins, Mr. R. Buchanan, and very many other modern writers. The ballads are arranged—the device saves trouble, but is not artistic—in alphabetic order, and we begin with “Admiral Hosier's Ghost.” We leap from Drayton's “Agincourt” to “Alison Grose”; and soon afterwards comes the imitation of Wordsworth in “Rejected Addresses.” However, almost all the ballads, old and new, are good in their several kinds. The illustrations are of very various merit. Though we could wish to see ballads collected and arranged in a more intelligent way, these two volumes are so full of good poetry that they should be welcome everywhere.

**Pictures from the Orkney Islands** (John T. Reid. Douglas).—This volume contains more than a hundred drawings, “etched by the author in pen and ink.” It is a singular method of “etching,” and unknown, we imagine, to the art of Mr. Seymour Haden and Mr. Whistler. But this is a mere question of words. The little drawings, as of the Old Pier-head at Kirkwall, and the pears on the garden wall (Plate I.), are very clever and delicate;

and the same praise may be given to the drawing of the ruins of the Bishop's Palace (Plate v.). There is a want of perspective in “The Foot, Shapinsay” (Plate viii.); and the larger landscapes are less successful, because the method of the artist is less adapted to such work than to the smaller “bits” of architecture and the designs of grotesque crags and breaks in the cliffs.

**The Delgravia Annual** (Chatto and Windus) is, as usual, an excellent companion on a railway journey. We cannot praise Mr. Wilkie Collins's story; but “Pausodyne,” by that versatile writer Mr. Arbuthnot Wilson, is amusing; and Mr. James Payn's “Two Delicate Cases” cannot fail to divert the gloomiest reader.

**Vanity Fair Album** (Office of “Vanity Fair”).—It is not the fault of the artists that they have to caricature men of whom the great public never heard. Of about half of the “statesmen” here delineated the names are to us perfectly unfamiliar; and, if one has heard of Mr. Ryle and Alderman Fowler, it is scarcely as statesmen that they are best known to this generation. The drawings, however, of Mr. Frederick Archer, Lord Harris, Mr. Burnand, Mr. W. S. Gilbert, and Colonel Gordon represent persons who have really won fame, and are, therefore, interesting enough.

**The White Chapel** (Esmé Stuart. S.P.O.K.)—Nobody would ever guess the meaning of the title of this amusing little story. It is nothing less than the name given by an old lady to her bed, on account of a fanciful analogy to the chapel wherein the maiden knight kept watch in the middle ages. The old lady, in spite of her imaginative turn of mind, is a very pleasant and wise person, who takes a little girl to educate and bring up. This child is admirably drawn, and so are her brothers who come to pay her a visit, and send her to Coventry because they find her out on a midnight expedition to the cathedral. Poor Patty is made very miserable at their openly expressed preference for a cousin who is “quite a young lady,” and at having her devotion, which has aspired to learning how to mend their old boots, openly set at naught. Miss Stuart is so successful in her sketches of children that we hope she will give us many more of them.

**Every Boy's Annual** (Routledge).—The four continents and most of the centuries have been laid under contribution, to furnish entertainment for every boy. The Rev. H. C. Adams sends some interesting Traveller's Tales, and Lady Lamb furnishes short accounts of various popular historical personages. We must, however, protest against the shameless way in which Francis I. is flattered in the picture on p. 178. The artist has drawn him as the elegant young monarch one somehow imagines him to be, before one has seen the contemporary long-nosed portraits that represent him as he really was.

The marvellous adventures of two very plucky and amusing children, Tumpy and Chuffy, must be read in *Among the Ghibys* (Sydney Hodges. Illustrated by H. Petherick. Remington, 1881). This is a volume of fantastic travels, which we think children will find really entertaining, while the fraternal affection of Chuffy and Tumpy is as much to be imitated as their plan of scaling a Welsh mountain with no provisions but a box of acid drops is an example to be avoided. The little book somehow reminds one of childhood and its day-dreams, and the numerous pictures, among which that of “the shoe house” is particularly humorous, will be the joy of many nurseries; some of the landscapes are particularly impressive. While that king of nonsense, Mr. Lewis Carroll, rests on the laurels of *Alice*, we are not likely to have a more pleasant book of fantasy than *Among the Ghibys*.

**The Adventures of Herr Baby** (Mrs. Molesworth. Illustrated by Walter Crane. Macmillan).—Mrs. Molesworth has written a more successful child's book than usual, and this time we believe that children will be honestly interested in *The Adventures of Herr Baby*. These adventures, it is true, were but small, as we should expect from his size and age; but they are told in a natural straightforward way, and without any grown-up reflections. We cannot, however, help thinking that Mrs. Molesworth makes her children talk in unnecessarily quaint language; at least it is not common among the infants of our own acquaintance to converse after the following fashion:—“Not in winter, Fritz,” said Baby, “him wouldn't mind in winter when the water are so cold. Lisa, when the wevvy cold mornings comes, him's going to be a Frantiker.” This kind of talk would be hopelessly confusing to a child who was reading to itself. Many of the illustrations are very pretty, though “Baby” is frightfully fat.

**Milly and Olly** (Mrs. T. H. Ward. Illustrated by Mrs. Alma-Tadema. Macmillan).—Mrs. Ward's story is written in very little words, and is intended only for very little children. It is simple and uneventful, except for those small events which make up the sum of children's lives, and are contemplated in early years through a very large telescope. Mrs. Ward has not attempted any lofty heights, or any out-of-the-way effects. She has taken two ordinary children and related the history of their trip to the mountains, and the pleasures that awaited them there, in plain, easy language that will render her book acceptable to those for whom it is intended.

**The Three Trappers: a Story of Adventures in the Wilds of Canada** (Achilles Daunt. Nelson).—It is a melancholy fact that, as Mr. Daunt says in his preface, many of the buffalo herds are becoming extinct in Canada, and are only to be found in scattered groups on the sides of the Rocky Mountains. What the writers of boys' books will do without these useful animals we are at a loss to imagine. They fill so many gaps when other quadrupeds are exhausted, and form a kind of temperate zone between the tropical lion and the polar bear. All kinds of beasts, however, brighten the pages of *The Three Trappers*, the scenes of which is laid in the North-West Territory. Grizzly bears, antelopes,

grey wolves, rattle-snakes, and many others cross the stage, and we fear that these trappers have to answer for much of the wholesale and indiscriminate slaughter which their biographer deplora. The book is well written and interesting, and boys will pick up a quantity of useful information.

*Hillside* (F. H. Morgan. Griffith and Farran).—*Hillside* will have a special interest to people dwelling on the north coast of Yorkshire, for it tells of that country in the beginning of the century, when smuggling was at its height. The characters talk in the rather didactic fashion which seems to be considered as much a part of the life of the period as the rosewood furniture or the horror of "Boney"; but the book is perhaps none the worse for that, and contains plenty of adventures.

*Unto His Life's End* (Ursula. S.P.C.K.).—It is not possible to imagine a more well-meaning book than this; but we are obliged to confess that it is very dull. Did any set of boys that ever lived talk and act after the manner of these; or, if they did, would other boys be found to read about them? It is difficult enough for a woman to draw a man, but when she attempts to describe a boy the failure is generally more absolute still.

*The Young Draytons* (Mary F. A. Trench. S.P.C.K.).—The young Draytons made themselves famous by escaping into the Bush to avoid their coming stepmother, who afterwards turned out to be their favourite playmate. The boys have quantities of adventures, and end by having to stand for hours in a creek, out of the way of the burning Bush. However, all's well that ends well, and they got home at last much ashamed of their folly.

*The Union Jack: a Magazine of Stirring Tales both by Land and Sea*, 1881 (Edited by G. R. Henty. Sampson Low).—*The Union Jack* is a magazine of the usual sort. There is a story by Jules Verne, called "The Steam Horse," which is certain to prove attractive; and one by Mr. Penn, always a lively writer. Then there are papers on birds, chapters on insects, and prizes offered for pictures, which we sincerely hope will be superior to the numerous and hideous illustrations scattered through the book.

*A Gem of an Aunt* (Mary E. Gellie. Griffith and Farran) was one of those abnormal creatures who reward their infant relatives for getting into worse scrapes than usual by an extra slice of bread and jam. The story is exceedingly simple, and only intended for very young children.

*A Boy's Ideal* (Frances E. Cooke. Sonnenschein).—The "Boy" was Sir Thomas More, and the book is a pleasant sketch of his genial life. We are glad to welcome something strong among the rather weak-minded tales that are considered appropriate to Christmas.

*Grizzy's Story* (Mary Dawson. S.P.C.K.).—Grizzy is a doll, which tells her history to her little mistress when she is waiting for her tea. The tale begins at the time that the doll emerges, unclothed, from the toy-shop, to be sent to the poor woman and her daughters, whose business it is to dress her for sale. We are let off with one illustration, but that is very bad.

Among Nursery books we have R. Caldecott's *Picture Book*, No. 2 (Routledge), in which the "Farmer's Boy" and the "Queen of Hearts" are added to our old favourites. The King of Hearts is a most royally insane person, and the Queen's cat an intelligent animal. The landscape in the "Farmer's Boy" has a pleasant air of the country.

*The Merry Nursery* (Strahan and Co.) is a pleasing miscellany of pictures, verses, and fairy tales.

There is more elaborate art in *Eva's Mulberry Tree* (Seeley), an epic of the English nursery, with coloured pictures by E. L. Seeley.

Nursery rhymes are fancifully illustrated in *Pinafores, Red Coats, and Blue Jackets* (Warne and Co.).

*Three Wise Old Couples* (Words by Mrs. Corbett. Pictures by Hopkins. Cassell, Petter, and Co.) is a romance in the manner of the *True History of Lucian*.

In *Grandpapa's Verses and Pictures* (Griffith and Farran) the verses are not so good as Mr. Morris's illustrations; but they are intelligible and have a story to tell.

#### MINOR NOTICES.

**R**EADERS of Mr. Woolner's charming poem, *My Beautiful Lady*, will have looked forward with much interest to the production of his *Pygmalion* (1), a subject which it seemed especially fitting that Mr. Woolner should take in hand. In treating it he has struck out a new line, the nature of which may be most readily indicated by a quotation from the speech made to Pygmalion by Aphrodite when she reveals herself in answer to his prayers:—

This my reward, your Hebe shall have life  
And immortality. For times to come  
Shall sing your story. Not the sweetest dream,  
As stretched you lay on shadowed forest bank,  
Has ever promised such a paradise  
As mine awaiting you. But, hark! Before  
These high Olympian gifts are yours to hold,  
Braced must you be to battle for your own.  
Dire hate will strew your path with scorpions,  
And dog you for your life. Foul calumny  
Will taint your name with poisonous lies, truth-tinged,  
Whereat familiar friends fall back appalled,  
While other loved ones sledge the barbed lies.  
For Gods do not their rarest gifts bestow  
Without sure test and payment.

Accordingly, we are told how, by the artful plottings of an envious pupil, the mob of Cyprus is stirred up against Pygmalion; how his popularity is suddenly restored by his overthrow of three ruffians, among them the pupil, who set upon him and attempt to murder him one night; how he is chosen as commander-in-chief to resist the attack of the Egyptians; and how, finally, he, on the death of the old King, is elected to the throne of Cyprus. All this is described for us in finely-flowing verse; but among the most interesting passages of the book are those which in its earlier part deal with Pygmalion in his workshop, and describe the various groups which he has

Laboured to show; bound by those rules of Art  
The Wise had found inexorably fixed.

As to the coming to life of the statue of Hebe, Mr. Woolner has, it may be thought, hardly made his meaning sufficiently clear. Ianthe, one of the maidens of the sculptor's mother, has stood to him for the statue, and the artist and his model are in love with each other without either knowing the other's feelings, until Orsinus, Pygmalion's friend, asks Pygmalion to sue for Ianthe's hand in his behalf. This task Pygmalion loyally discharges, but his doing so leads to an explanation, and to his seeking his mother in company with Ianthe, and crying, "O mother, I have found her! Hebe! she is come to life!" The cry is taken up, and the report of a miracle is noised in the city. This is a pretty enough conceit; but it is open to the objection that the intervention of the goddess was hardly necessary to bring about the wedding of Pygmalion and Ianthe. As we have said, there are many charming qualities in Mr. Woolner's verse, but he seems to have caught from another writer an unpleasant trick of leaving out the definite and indefinite article, instances of which are found in this verse from a song:—

On bough a white dove gazed at me  
When I was sad;  
In grass a serpent gazed at me  
When I was glad:  
I hated dove to gaze at me  
When I was sad;  
I laughed to see the serpent gaze  
When I was glad.

To be consistent Mr. Woolner should have written, "I laughed to see serpent gaze." The account of the battle at the end of the poem, between the Egyptians and the Cypriotes under Pygmalion's command, is full of spirit.

Mrs. Pfeiffer has written a preface to her book, *Under the Aspens* (2), in which she says that "The Wynnes of Wynhavod," the dramatic part of the book, was written in the hope that it might, "with the kindly aid of some borrowed technical experience, be found proper for representation on the stage." Her first attempt, however, at "benefiting by managerial help induced an experience of so different a nature that I was fain to make this earliest example of the treatment to which authors are liable at the hands of managers my last, and to content myself with an appeal to the public on literary ground alone. With this view, the purely subjective parts of the play have received additions in places where it has appeared that characters and situations, denied the advantage of scenic illustration, would benefit by further verbal development." Mrs. Pfeiffer has undoubtedly, as she goes on to say, faced many difficulties in writing a drama of modern life in blank verse throughout; and if, as the preface seems to imply, she has been discourteously treated, we are sorry for her; but we cannot be in the least surprised at any manager not having found "The Wynnes of Wynhavod" "proper for representation on the stage." It has, in truth, not one dramatic quality. The plot is lacking in novelty, strength, and plausibility; and the characters are but *simulacra*. More than once Mrs. Pfeiffer makes the serious mistake of preparing her readers for situations which at the last moment are interfered with. Thus one scene is delayed by a game of cross-purposes which comes to nothing, and in another the villain three several times takes aim at the lovers with a pistol, and as many times lowers it, overcome with remorse. At the end of the same scene occurs this remarkable stage direction:—"Robert Murdoch sinks upon a chair and raises the pistol to his mouth. The discharge is heard as the curtain descends." The verse is throughout pleasant and polished, but more than the power of writing smooth verse is wanted to make a play. In the lyrical part of the book there is far more to admire, and Mrs. Pfeiffer has handled the difficult subject of "Rorke's Drift" with much spirit; while we may give special praise to the sonnet "Learn of the Dog."

A second and enlarged edition has appeared of Signor Bach's lectures on musical education (3), a work which is very well worth the attention of all who are interested in the art of singing. In a singularly modest preface Signor Bach writes, "Properly speaking, there is nothing new to be said respecting the art of singing, yet I should deem myself fortunate if I could impart to my readers everything of real importance that has been handed down to us from the old Italian school." He goes on to explain that the demand for a second edition has prevented him from following "Horace's advice not to hurry the publication of literary productions, but rather to keep them in one's desk for nine years," and "consequently, I have to come forward even at the risk of learning from some modern Horace that this little work

(2) *Under the Aspens: Lyrical and Dramatic*. By Emily Pfeiffer. London: Kegan, Paul, Trench, & Co.

(1) *Pygmalion*. By Thomas Woolner. London: Macmillan & Co.

ought to have been kept in the desk, not for nine years only, but for ever." We feel sure that Signor Bach's readers will be grateful to him for not having kept his little work in his desk. It is full of interest and value. On the very important question of breathing Signor Bach is perfectly sound and lucid, and what he has to say might be studied advantageously both by amateurs and by many professional singers. Such a study would prevent its being possible to hear what it was not very long ago our misfortune to hear—a singer undertaking an important part in an opera, and taking breath in the middle of a triplet. We are tempted to quote some excellent remarks of the author's in this connexion, concerning the old Italian school. He refers to Leonardo Leo, Francesco Durante, Nicolo Porpora, Antonio Pistocchi, and others, as authorities on the subject of breathing, and points out that "these masters were nearly all great singers; and their method, which will be the standard for all times, consisted mainly in the cultivation of the *portamento*, and the development of the voice, with noble formation of tone. . . . Nor was the florid style neglected, and it is with good reason to be recommended to every singer as a means of cultivating voice and delivery. All the writings on the old Italian school extant state that the florid style also formed a part of the singer's training, which must have contributed essentially to the mastery of *portamento* singing, which precisely in those times attained its highest artistic perfection, and the voices were then preserved in great freshness and healthiness for a remarkably long time. The notion of the modern school that ornamented singing would wear out the voice is, therefore, altogether wrong." Elsewhere Signor Bach seems to hint that the art possessed by the great masters whom he cites of "making each singer sing according to his capacity and the special peculiarities of his voice, and not all one way," is lost. In this he is possibly too pessimistic. There is at least one well-known teacher in London who has preserved this art. In his chapter or lecture on "Musical Culture" Signor Bach inveighs not one whit too strongly against the "so-called professors" who, having taken a dozen singing-lessons, set up as teachers of the art of singing, and find their profit and their pupils' loss in so doing. He recommends, most wisely, every one who wants to learn singing to go to "old opera and concert singers of established reputation, who are in possession of experience and skill, though only possessed of a remnant of voice"; and he goes on to quote Roger's feats—which have been rivalled, perhaps, by Signor Mario—after his voice had practically left him. Signor Bach's latest lecture, on "The Equalization of the Voice," has a special interest on which we cannot linger now, but of which we may possibly have something to say on a future occasion.

Captain Nicholson has written an unpretending and interesting account of what he has seen, and of the conclusions which he has drawn from his observations during his stay in Hawaii. His book (4) will be of the greatest use to those who may think of following in his footsteps, and contains plenty of matter that will amuse the general reader.

A new edition has appeared of Mr. D. G. Rossetti's poems (5).

We have also before us the Eversley Edition, beautifully got up and printed, of Charles Kingsley's works (6), to the first volume of which Mr. T. Hughes has prefixed an interesting and characteristic prefatory memoir.

The *édition de luxe* of Dickens's works published by Messrs. Chapman and Hall (7) is equal to other editions of the same kind in the excellence of its type, and is, of course, somewhat unwieldy in size—at least the volume now before us is. But this is a consideration which will not deter collectors from desiring to possess it.

There can be little doubt as to the attractions of the new *Cyclopædia for the Young* (8) issued by Messrs. Kegan Paul and Trench. The work has already had considerable success in America, but has undergone important modifications in the English edition. "The American edition naturally drew its illustrations from objects with which boys and girls in America would be most familiar; and among the animals described some would have little interest for readers in this country." In connexion with this it is a little odd to find an article devoted to the chipmunk, which contains no hint that chipmunks are not to be found in England; and some English boys and girls may be puzzled at learning that "cats' skins are used for making sleigh robes." Perhaps, however, the few little slips of this kind may have their use in leading "the young" to ask for further information. It may be well to add that the subjects treated are confined to the natural sciences, and to practical details of arts and manufactures.

There is a peculiarity about the "new edition" of the *Curiosities of Literature* (9) which calls for notice. The unwary reading the "Advertisement," which is dated London, 1881, might think that

it was in every sense a new edition. The Advertisement runs as follows:—

This is the first collected edition of a series of works which have separately attained to a great popularity: volumes that have been always delightful to the young and ardent inquirer after knowledge. They offer as a whole a diversified miscellany of literary, artistic, and political history, of critical disquisition and biographic anecdote, such as it is believed cannot be elsewhere found gathered together in a form so agreeable and so attainable. To this edition is appended a Life of the Author by his son, also original notes, which serve to illustrate or to correct the text, where more recent discoveries have brought to light facts unknown when these volumes were originally published.

Now this is, word for word, the Advertisement prefixed to the edition of 1859, except that in that edition the words "to this edition is appended a Life of the Author by his son, also original" &c. &c. do not occur. The 1859 Advertisement runs "so agreeable and so attainable. Some notes are appended to illustrate," &c. In other respects the "new edition"—Life, notes, and all—is a reprint of the edition of 1859.

We have before us several volumes of Routledge's sixpenny series of novels (10) which are well chosen and well printed.

Captain Verney has written a little manual containing the rules of four-handed chess (11) as played by himself and his friends, and various remarks upon the game. Whether the game will ever become popular is of course an open question; but the writer, in a letter to the *Times* on September 20, said that many good chess-players agreed with him that, as far as mere amusement went, the four-handed was a better game than the ordinary one. Captain Verney, it may be added, will "be very glad to hear at any time from players of four-handed chess, and to promote as far as possible its introduction both in Chess Clubs and private families."

The success of Mr. Paley's first little volume of *Greek Wit* (12) has induced him to issue a second series as well selected and as prettily got up as the first.

Miss Ryan's book on *Convalescent Cookery* (13) is full of sound sense and useful hints. We are only sorry to miss in the "Miscellaneous Recipes" a description of the invaluable *lait de poule*.

Mr. George Smith of Coalville has followed up his *Canal Population* with another book (14), which is eminently characteristic, which contains many facts of much importance concerning the working or non-working of the Canal Boats Act of 1877, and which we sincerely hope may do something to advance the cause which he has at heart, and for which he has laboured so much.

Readers of Mr. Church's former work will assuredly welcome his charming version of *The Story of the Persian War* (15), with its carefully chosen and carefully coloured illustrations. The style is as good as possible, as may be seen by, amongst other things, the version of the story of Hippocides.

(10) *Routledge's Demy 8vo. Sixpenny Novels—Night and Morning.* By Lord Lytton. *Jacob Faithful.* By Captain Marryat, &c. &c. London: Routledge.

(11) *Four-handed Chess.* By Captain George Hope Verney. London: Routledge.

### THE PROPERTY DEFENCE ASSOCIATION.

THE attendance at the important meeting at the Mansion House was on the whole satisfactory. The presence of Lord POWERSCOURT, of Sir JOHN LUBBOCK, and of other Liberal politicians, as well as the letter of the Duke of WESTMINSTER, proved that the movement is not confined to one political party. It is to be regretted that Mr. HUBBARD should have thought it necessary to oppose the objects of the meeting, although many persons probably agree in his opinion that the Association will to some extent undertake duties which properly belong to the Government. The subscription deserves support so fully that there is some inconvenience in expressing the incidental reflections which it suggests. The organizations in Ireland which the promoters intend to assist furnish an answer to the heartless taunts addressed by Mr. GLADSTONE and others to the persecuted Irish landlords. The Emergency Committee and the Property Defence Association have done more than could be expected to counteract the agrarian conspiracy which the Land Act has rather encouraged than checked; but the landowners, with the exception of those who have resources independently of their Irish estates, are unable to contribute largely; and it is not remarkable that Englishmen who are interested in the protection of property should come to their aid. The favoured correspondent who on behalf of the Irish Land League habitually supplies the *Times* with paradoxes and fallacies affects to believe that those who have responded to the invitation of the LORD MAYOR are exclusively City capitalists, because they have held their meeting in the Mansion House. The subscribers are, according to Mr. F. H. O'DONNELL, landlords of the Irish landlords; or, in other words, mortgagees who are the ultimate recipients of the rents. They are also confounded with purchasers under "the infamous Encumbered Estates Acts," which were, as it may be remembered, passed with the unanimous approval of all parties for the purpose of substituting new and solvent owners for the old race of needy and embarrassed landlords. It is notorious that the purchasers whose Parliamentary title has been summarily disregarded by Parliament were for the most part Irishmen of the middle class, who thought that their money might be safely invested in land. The few English capitalists who may have engaged in the same speculation are perhaps better able to bear the loss; and it is improbable that they were largely represented at the City meeting.

Although no official statement of the objects of the movement has yet been published, the funds which may be collected will probably be applied to the purchase of interests and property which may be sold under legal process employed for the recovery of rent. Notwithstanding the slackness of the Government in discharging its primary duties, there is reason to believe that protection will be afforded to the officers of the law and to purchasers. It will be a matter for further consideration and experiment to ascertain how property lawfully acquired may be securely enjoyed. The Association can only confer legal possession on those who may be duly entitled. It is the business of the Executive Government, under its general powers or with the aid of special enactments, to suppress violence and disorder. The clamour against the Association as instigators to civil war may be answered by the fact that the Association is not a party to the instigation of the Land

sincere. No administrator of the Mansion House fund will have any material force at his disposal, for the public authorities will be exclusively responsible for the employment of the soldiery and the police. It might fairly be argued that the expense of protecting property ought to be borne by the nation rather than by the litigants; but there is no time or leisure to raise doubtful questions; and it is known that the sufferers appeal to private liberality for immediate aid. Competition in subscriptions with Fenian clubs in the United States may be undignified and unsatisfactory, but it is better that the conspirators should be defeated with their own weapons than that they should organize systematic robbery without opposition. It is perhaps superfluous to answer charges of complicity with civil war which are preferred by systematic advocates of treason.

It may be hoped that the subscription will not be discouraged by the awkward advocacy of Ministerial journals, and especially of the *Times*. The perverse attempt to devolve the responsibility of Government on a voluntary Association was caused perhaps rather by involuntary obtuseness than by deliberate partisanship. The answer to an imaginary charge of departure from strict neutrality was altogether unnecessary. At the present moment every honest politician is bound to take a part in the struggle between justice and violence. The apologists of crime have actually founded an argument on the strange decisions of the Irish Sub-Commissioners. The judicial spoliation of owners is cited as a proof that injustice had been previously inflicted on occupiers; and it is not obscurely hinted that the refusal of rent is partially excused by the excessive amounts which have hitherto been levied. It is perhaps not surprising that the assurances by which the Government persuaded Parliament to pass the Land Act should be disavowed when they have affected their object. Subscribers to the Mansion House fund cannot pretend to be neutral between right and wrong. It is essential to the success of their enterprise that they should dissociate themselves from party politics. As far as they are concerned, the question whether the Government has discharged its duty may be conveniently left in abeyance. Their contributions are destined to supply an undoubted want; and it is not their present business to inquire whether it has been artificially created. If they publicly attribute blame to the Government, they will alienate its devoted followers; and they would cause more general irritation by adopting the doctrines propounded by the *Times*. Some willing contributors might refuse to take part in a movement which was founded on the assumption that the enforcement of the law was a proper object of voluntary organization. The theory was implicitly abolished when private warfare was discontinued.

If Mr. O'DONNELL is justified in his assertion that various incumbrancers will share in any relief which may be afforded to landlords, there seems to be no reason to regret the result. A creditor who has advanced money on land is as well entitled to the benefit of his security as the borrower to the surplus on the reversion. It is scarcely advantageous to the entire Irish community that it has become impossible to obtain any advance of capital even for profitable purposes. Mortgagees are not the only partners in the property which ostensibly belongs to the landowners. Widows and younger children commonly depend for their livelihood on the proceeds of the estate which the occupiers, at the instigation of the Land

League, are dividing among themselves. It may during the present reign of terror be found impossible to provide successors to the usurping occupiers; but something will be gained if they are legally and actually evicted. It is not necessary that every contributor to the Mansion House Fund should understand the details of the process by which the landlords and their creditors are to be assisted and protected. The Irish landlords who have associated themselves for their own defence have given the best proof of their confidence in the organization by consenting to rateable assessments which most of them can ill afford while the richer owners have in addition given liberal subscriptions. If in some instances they have done at their own expense what ought to have been done by the Government, they are not to be blamed. Their action against recalcitrant tenants will not be always or necessarily hostile. Many of the occupiers are willing as well as able to pay their rents in the reasonable belief that the law of property will at some future time be once more enforced. Payment to avoid immediate eviction will perhaps even by the Land League be so far deemed excusable as to exempt the tenant from liability to murder or even to the mutilation of his cattle. In such a case force, as far as it is applied to the protection of the officers of the law, will be a remedy.

Mr. GLADSTONE's telegraphic message to the LORD MAYOR, received on the day of the meeting, is so far explicit and satisfactory that the Government admits the movement to be justifiable. It could scarcely be expected that the Ministers should add the expression of a more definite opinion. The Irish Government has offered no discouragement to the efforts of the Property Defence Association; and it must be allowable to aid by pecuniary contributions any organization which has a lawful purpose. The Duke of WESTMINSTER, one of the most faithful supporters of Mr. GLADSTONE, defines the object of the Defence Association as "the re-establishment of law and order, and the prevention of plunder." The greatness of the danger, or rather the extent of the evil, which prevails is well explained by Mr. PLUNKET in his powerful speech at Leicester. If Mr. HUBBARD were right in his opinion that the fund was intended to take up the work of Government in Ireland, it would be better that a necessary task should be accomplished by anomalous methods than that it should be wholly neglected; but Mr. GLADSTONE in his communication to the LORD MAYOR sufficiently answered Mr. HUBBARD. The lists of subscribers will be watched with a certain interest. Of the great landowners in the south of Ireland, Lord FITZWILLIAM is for the present the most conspicuous supporter of the movement. He had previously joined the Property Defence Association, and subscribed liberally to its funds in addition to his proportional assessment. Among the greater English and Scotch landowners who attended the meeting or approved its objects are not only the Duke of SUTHERLAND, who has, perhaps, detached himself from the Liberal party, but the Duke of BEDFORD, as well as the Duke of WESTMINSTER. It may be inferred from the guarded language of Mr. GLADSTONE's message that none of the Ministers will allow their names to appear as subscribers to the fund, though some of them most heartily approve its objects.

#### FRANCE AND TUNIS.

THE debate on the affairs of Tunis in the French Senate allowed the two best speakers in France to engage in an equal and honourable conflict. The attack of the Duke de BROGLIE and the defence of M. GAMBETTA were alike in the best style of French Parliamentary oratory—in that easy, vague, conversational style which permits a constant flow of hints, repartees, and satires, a constant display of the adroitness that chooses or shifts the issues of debate, and a constant interchange of the politeness that wounds with a smile, and the moderation that simulates the abandonment of a contest in which victory is assured. A debate conducted in this way is, not perhaps so impressive as a debate conducted in the English style. The speakers do not so completely exhaust their subject, do not so fully force home their points by the artifices of varied repetition, and do not find such natural occasions for the flights of laboured rhetoric or the bursts of genuine oratory. But it is more interesting, more animated, and far shorter. There is nothing

worth adding that could be added to the exposition which the Duke de BROGLIE gave of the intricacies and dangers which must attend the future relations of France and Tunis. But, on the other hand, few chiefs of a new Cabinet could rival the skill with which M. GAMBETTA neither associated himself with his predecessors nor threw them over, and, without committing himself to any particular course, gave the impression that innumerable solutions of Tunisian difficulties were present to his ingenious mind. The Duke de BROGLIE gave a piquant sketch of the leading episodes of the expedition, of the subterfuges of M. ST.-HILAIRE, and of the fright of the FERRY Ministry lest what they were doing should be known before the elections. He soared into poetry when he spoke of the noble sons of French homes who have strewn with their dead bodies the devouring sands of that land of fire. But all this did not touch M. GAMBETTA. He stripped some of the romance off the last statement by remarking that the total loss of the French army had only been eleven hundred men; but as to the statements of M. ST.-HILAIRE and the manoeuvres of M. FERRY, he replied that he was only a simple deputy at the time and had no responsibility. The Duke is much too able a debater to press a point where the reply of his adversary is on the surface absolutely complete, and he passed on to discuss the future for which M. GAMBETTA will be incontestably responsible. He urged that a protectorate had all the evils of annexation; that France, whether protecting Tunis or annexing it, would have the Porte as its neighbour, and suffer all the inconveniences of the neighbourhood; that if France controlled the revenues of Tunis, she must pay or guarantee the Tunisian debt; that a large portion of the French army would be locked up in a quarter where it would be useless in a European war; and that most disagreeable diplomatic quarrels would arise possibly with Spain, probably with England, and certainly with Italy. Why should not a French Ministry have the boldness to imitate the English Ministry—to retire from a dangerous situation into which the country ought never to have been dragged, to disregard the temporary clamour of an aggrieved patriotism, and to give up Tunis as England had given up the Transvaal. It is true that the BARDO Treaty exists; but, as the Duke inquired, is it too much to hope that the BER might be induced to give up even the BARDO Treaty if the gentle methods of persuasion which influenced him last May were again applied?

It was for M. GAMBETTA an easy retort that there was nothing he should like better than to make with Tunis a treaty like that which England has made with the Transvaal—a treaty by which a French agent, and no other agent, was to reside in Tunis, and Tunis was to be cut off from the world except through the intervention of French diplomacy. The parallel of Tunis and the Transvaal is obviously a false one; and the Duke merely meant to say that the argument from the national honour of France being engaged in Tunis must not be strained so as to make perpetual a blunder that might be made temporary. When he came to speak of what was to be the future of Tunis, M. GAMBETTA threw little light on Tunis but very much light on himself. One of the witnesses in the ROUSTAN trial said that, at the period of which he was speaking, M. GAMBETTA knew nothing about Tunis; and this ignorance seems to have lasted in its full intensity until about three or four weeks ago. Tunis is to him a new field of knowledge and thought, and its novelty stimulates his imagination. He approaches this subject as he approaches other subjects—with a profound conviction that, however puzzling the subject may seem, he will somehow find the right solution; and that he will not only adopt it, but make others see that it is the right solution. He allows his mind to play freely over the ground before it. He likes to think of every possibility, and when a subject is so new to him as Tunis, many things seem possible which a person who had been thinking over Tunis longer would know to be impossible. Nothing could have been more singular than the spectacle of a Minister laying his crude thoughts before Parliament, owning that they were crude, and owning that at present he does not know which thought is better and more valuable than any other thought. But nothing could show more clearly that the Minister who has now to decide what France is to do in Tunis approaches this difficult question with a perfectly unfettered mind. Perhaps it may be better to continue the Financial Commission in Tunis; perhaps not. Possibly something like the Egyptian plan, with

Controllers-General, would do; possibly, as Egypt and Tunis are very unlike, it would not do. It might be necessary to make France responsible for the debt of Tunis or it might be unnecessary. Diplomatic difficulties might also be smoothed over. England was already quite inclined to be pleasant about Tunis, and as to Italy M. GAMBETTA thought that there might be even with Italy some sort of tractation. One of his hearers called out that this was quite a new word, and M. GAMBETTA cheerfully replied that he had coined a word, because no existing word expressed the peculiarly delicate arrangement, or approach to an arrangement, which he had in his head. A Minister coining ideas and coining words visibly in the face of all men would certainly have awakened the French sense of the ridiculous had it not been so obvious that no one but a strong man could have ventured to do it. It bespoke a belief in himself to which his audience involuntarily responded. France knows no more of what is to be done in Tunis than it knew a week ago, but it knows that the decision is in the hands of a man who has that union of imagination and tenacity which sometimes leads to great disasters, but also leads to great successes.

M. ROUSTAN has this week been the hero of a trial which has largely gratified the scandal-loving public. M. ROCHFORD had printed in his paper a statement that M. ROUSTAN had got up the Tunis expedition for stock-jobbing purposes, had taken bribes, and had been the accomplice of an Italian adventuress who had extraordinary influence, and freely sold her influence for M. ROUSTAN's benefit and her own. M. ROUSTAN has come from Tunis expressly to show that this statement is a libel and is wholly untrue. The conduct of a French trial is so very peculiar, and so utterly inconsistent with English notions of what a trial ought to be, that it is almost irrelevant to criticize the evidence offered on either side. M. CAMILLE PELLETAN said that he had travelled lately in Tunis, and had heard that M. ROUSTAN took bribes. M. WADDINGTON testified that he had the highest respect for M. ROUSTAN, and could state that M. ROUSTAN was now as poor as when he went to Tunis. M. DE LESSERES solemnly testified that the lady was very pretty. Another witness with equal solemnity deposed that she was forty-eight, and that M. ROUSTAN was not in the least likely to be swayed by her charms. A side controversy was discussed with extreme acrimony as to whether M. DE BILLING had or had not been authorized by M. ST.-HILAIRE to report to him on Tunis. M. DE BILLING established the fact that he had sent M. ST.-HILAIRE a report; but then M. ST.-HILAIRE as clearly proved that directly he got the report he put it in the fire. There is no apparent bearing in this or in any part of the evidence on the question whether M. ROUSTAN took bribes. The gossip of Tunis says he did, and M. ROUSTAN says he did not, and M. WADDINGTON and M. ST.-HILAIRE believe M. ROUSTAN and disbelieve the gossip. What with the debate as to the lady's charms, and what with a man like M. ST.-HILAIRE publicly calling an adverse witness a liar, there was enough and more than enough to amuse a Parisian public. The case only became serious when the jury gave a verdict of acquittal in spite of a strong indication on the part of the judge that the verdict ought to have been for the prosecution. Juries in political trials have very peculiar ways of conducting themselves, and it is understood that the jury meant to say, not that M. ROUSTAN had taken bribes, but that they do not like the company he had kept, and, still more, that they were heartily sick of the whole Tunis business. If the general feeling of France can be collected from the illogical verdict of a single jury, M. GAMBETTA may congratulate himself on having a freer field before him than was present to his mind when he was answering the Duke DE BROGLIE. He will, for example, have little difficulty in settling as he may think proper the Enfidra case, which has now assumed a new aspect. Mr. LEVY has been forcibly dispossessed. He has been turned out by Tunisian officials in the presence of French troops. It would seem, therefore, as if the very thing had happened to prevent which Lord GRANVILLE sent in the spring an ironclad to Tunisian waters. But it is too early to treat what has happened as an affront to England. The whole tone of M. GAMBETTA's speech shows that he is sincerely anxious not to give England any just cause of complaint; and, if wrong has been done, and if Mr. LEVY has not been dispossessed in accordance with the judgment of a competent local court, M. GAMBETTA may be confidently expected to direct without delay that proper

reparation shall be made, and the jurymen who have made M. ROUSTAN's return to Tunis almost impossible will be the first to rejoice that the great Enfidra case, which was one of his pet creations, should be buried in his fall.

#### IRELAND IN IRELAND.

IT is rather an unfortunate incident of modern civilization that the public attention is drawn from one subject to another with an ever-increasing rapidity; but it would certainly be more than rather unfortunate if the subscription which has just been opened at the Mansion House should draw off public attention from the actual state of Ireland, on which not many days ago it was beginning to concentrate itself. The relation of the new movement to the functions of executive government is a highly interesting problem; the exact steps which it is proposed to take for the assistance of the Irish landlords and other law-abiding persons are also highly interesting. But the point of main importance is the actual condition of Ireland itself. In one, and in only one, respect that condition shows signs of improvement. The anarchy is worse than it was last winter, but the attitude of juries seems to be better. There is either less connivance or less fear, and convictions have in several instances been obtained which would pretty certainly not have been obtained at the Winter Assizes of 1880. This, of course, as far as it goes, is encouraging. But it is to be feared that it does not go very far. The Lords Committee on Irish juries showed decisively of what class they are now for the most part composed. It is the class which, as a rule, profits by outrages in Ireland, but does not commit them—the class of farmers just above the very smallest. This class is at the present moment in the receipt of constant gifts from the Sub-Commissioners under the Land Act, and it is perfectly conceivable that the action of the IRISH SOLICITOR-GENERAL in his canvass for Derry may not have been without its effect on a people proverbially acute, and now eager only for gain, and entirely free from any sense of morality. "Return me," said the representative of law and order, "and such and such reductions of your rent will be the result." "Refuse to convict," Irish juries probably imagine the Government saying, "and the word will be passed to cease reducing." It was clear from the first that the Land Act would be capable of being worked as an enormous engine of bribery, and some satisfaction may be got out of the fact that some of the bribes have resulted in action in itself laudable.

It does not, however, appear that the recent convictions have in any way checked the evil-doers of the "No Rent" faction. The words of Mr. PLUNKET at Leicester the other day are those of a speaker who never uses words lightly, and whose knowledge of Irish history is perhaps equal to that of the English journalists who have taken the Duke of ABERCORN to task for exaggerating the relative gravity of the situation. Mr. PLUNKET says deliberately that "the oldest men cannot recall a time when the conscience of the Irish people was so demoralized and the attitude of the lawless so fierce and defiant." A statement like this is not rebutted by the vague and faltering optimism in which Lord CARLINGFORD indulged a few days later. The period which is assigned by Mr. PLUNKET certainly includes the time—some fifty years ago—to which the comparative anatomists of Irish crime are fond of referring. They choose to forget that at that time the population of Ireland was much greater than at present, which destroys the arithmetical proportion; and also they forget the less civilized condition of the country and the recent existence of galling restrictions, which destroy the logical proportion. But what they forget most of all is precisely what Mr. PLUNKET remembers. The gravity of the present situation lies, not so much in the actual outrages committed, not so much in the resistance towards English rule, as in the complete demoralization of the people. The cry of "No Rent!" is more subversive of society than any cry ever heard in Ireland before. And the cry of "No Rent!" which even Lord CARLINGFORD admits to be entirely novel, is the cry of the moment. There is no sign that this cry, whether in its simple form or in the disguise of demands for preposterous reductions, is growing any fainter; and there can be very

little doubt that, as has been more than once pointed out, nothing but a combined-attack on those who refuse to pay rent, and the application to them of the utmost rigour of the law, will do much good. It is in the possible assistance that may be rendered to such an attack by the new Mansion House subscription that its chief value consists.

The more, however, the actual state of Ireland is considered, the more certain does it become that, unless the present action of the Land Court is checked or modified, the demoralization of which Mr. PLUNKET complains will continue. For the source of that demoralization is the hope—it may be from the Land League, it may be from the Land Court—of inequitable, if not illegal, gain. It is not too much to say that every batch of decisions of the Sub-Commissioners tends to keep alive that hope. Persons like Mr. LABOUCHERE may find it convenient to assume that these decisions are unimpeachable, and that they prove the landlords to be in the wrong. Examination of the facts is utterly incompatible with any such assumption. Mr. GIBSON'S severe criticism of the constitution of the Sub-Commissioners may or may not be correct—that is a personal question on which it would be rather invidious to enter. But certain things are plain. The subject of Irish rents is no new one; it has been examined by authorities, partial and impartial, over and over again during the last half-century, and the result ratified and endorsed by the BESSBOROUGH Commission and the present PRIME MINISTER is that universal, or even general, over-renting could not be charged against the Irish landlord. Against this has to be set the fact that in hundreds of cases, taken presumably at random, and certainly from almost every part of Ireland, the instances in which rents have been raised will not exhaust the fingers of one hand, and those in which they have been left stationary are not much more numerous, while reductions have been wholesale and unsparing. If there were nothing more to be said, it would still be surprising that all the Commissions and all the independent witnesses for half a century should be wrong, and that a bevy of Sub-Commissioners, chosen at haphazard, underpaid, with strong inducements to do what they have done, should be right. But there is much more to be said. There are in evidence the preposterous dicta on which some of the more incautious Sub-Commissioners have publicly based their decisions. There is the fact that rents which tenants have paid for thirty, forty, and even sixty years, without experiencing any difficulty in "living" and "thriving," have been reduced. There is the impossibility, conclusive to experts, of properly examining farms at such a period of the year in such time as the Sub-Commissioners have allowed themselves. When all these things are taken together—the wonderful unanimity of the reductions; the conflict with precedent evidence; the wild principles announced; the physical difficulty, to use the mildest word, of revaluation by bird's-eye view; the suspicious circumstances of not a few of the judges—only the extreme prejudice can admit the decisions arrived at as even possessing an appearance of fairness. It may be said that the hearing of appeals will decide the matter, inasmuch as, despite some perilously loose language at first, the Commissioners themselves, or at least the majority of them, appear to be guided by some knowledge of law and some sense of justice. But it is forgotten that in only a very few instances do the cases go in groups, so that the affirmation of one principle will settle many disputes. In most the question is a question of facts, the very facts which the Sub-Commissioners have decided on the spot with light heels and hearts. The Commissioners may, indeed, appoint responsible valuers, or may even transfer themselves to the spot; but all this means delay and expense. The expense will deter many half-ruined landlords, the delay will encourage many wavering tenants. Thus there is hardly a chance of the demoralization ceasing because one at least of its main exciting causes is likely to continue. Perhaps the best thing to be done (and it is most probable that it will be done) would be the bringing of the conduct of the Sub-Commissioners formally before Parliament as soon after its opening, as possible, with abundant instances the collection of which will certainly not be difficult. It has been usual, and indeed natural, for Ministers to object to any criticism by pointing to the Court of Appeal. But the Court of Appeal is from the nature of the case unlikely, and indeed unable, to remedy the evil which the Courts

of First Instance are doing. It is the members of these Courts who are encouraging demoralization in Ireland; and while they go on as they have begun, that demoralization will continue.

#### FOREIGN POLICY OF THE UNITED STATES.

MR. BLAINE'S despatches to the American Ministers at Lima and Santiago scarcely confirm the rumours to which they have given rise, though they contain one highly objectionable passage. The first of the series authorized Mr. CHRISTIANCY to recognize Señor CALDERON as President of Peru if he seemed likely to establish a constitutional Government. In the same despatch the SECRETARY of STATE recommended the Peruvians to accept unpalatable conditions of peace as more desirable than the continuance of foreign occupation. He further suggested the expediency of opening negotiations, if possible, before a preliminary cession of territory was demanded; but he added the declaration that the United States could not refuse to recognize the rights of Chili acquired by success in war. The victorious belligerent had on various occasions repeated the common form that the war was not one of conquest; but Mr. BLAINE had probably reasons for apprehending that a considerable cession of territory would be demanded. The first cause of quarrel was the interference of Bolivia with the private rights of certain Chilean citizens to mineral property in a district subject to Bolivian sovereignty. It soon afterwards appeared that the encroachment had been concerted with the Government of Peru, though the Peruvian Minister at Santiago was deliberately left in ignorance of the policy and engagements of his Government. In the contest which ensued, as in the Franco-German war of 1870, the wrongdoer was utterly defeated. After one or two combats the Peruvian fleet was taken or destroyed; and a Chilean army took possession of the hostile capital, which it has ever since retained. The Bolivians seem to have taken little part in the war which they had originally provoked; but probably the territory which had at first been the subject of dispute will be permanently annexed by the conqueror. In his despatches Mr. BLAINE only once mentions Bolivia, while he is anxious to prevent the infliction of unduly heavy penalties on Peru.

On the occupation of Lima President PIEROLA retired to the interior of the country. It is not known by what authority Señor CALDERON was appointed as his successor; but the American Minister, in the exercise of the discretion which had been allowed him, recognized his title. Mr. CHRISTIANCY was afterwards succeeded by Mr. HURLBUT, who apparently took a more active part in the dispute with Chili. Nothing in Mr. BLAINE'S instructions, as far as they have been published, justified his agent in declaring that the United States would refuse to recognize any compulsory cession of territory. On the contrary, the SECRETARY of STATE admitted that, in default of sufficient indemnities and guarantees, it might become a fair subject of consideration whether a cession of territory might not be exacted as the price of peace. A zealous subordinate perhaps wished to distinguish himself by assuming the protection of the weaker party; and he has consequently been severely censured, though his Government has not thought it necessary to recall him. The American Minister at Santiago, who has since died, was also reproved for undue zeal in the opposite cause to that which Mr. HURLBUT supported. Mr. HURLBUT'S intimation that the Chilean Government must forego the rights acquired by conquest was answered by the arrest of President CALDERON, who was sent as a prisoner to Santiago. Although no Republic in South America is likely to dispute the influence of the United States, the Government of Chili may probably have wished to assert its own independence. The American Government has no means of enforcing immediate obedience to its demands, as the coasts of Chili and Peru are out of reach of its land forces, and as it has no ironclad squadron at its disposal. It may be added that, except in one or two ambiguous phrases, Mr. BLAINE uses the language rather of friendly advice than of dictation. A friendly Power cannot be blamed for reminding a successful belligerent that "nothing is more difficult and dangerous than a forced transfer of territory carrying with it an indignant and hostile population." Similar warnings would perhaps have been addressed to Prince BISMARCK after the surren-

der of Paris, if there had been any permanent Power in Europe which could venture to address the German Government in a tone of superiority.

In a communication to the Chilean Government through the American Minister at Santiago, the SECRETARY of STATE makes the curious remark that the completeness of the Chilean victory renders diplomatic discussion impossible. He probably means to say that, with a view to the conclusion of a permanent peace, the victorious combatant would do well to facilitate the establishment in Peru of a regular Government with which it could negotiate. In the absence of accurate local knowledge, it is impossible to judge whether the annexation of any part of Peru would be advantageous to Chili. If such an acquisition were recommended by reasons of convenience, there would perhaps be little danger of arousing patriotic resentment on the part of the population which might be transferred. The former Spanish *Vas-royalties*, now formed into separate Republics, can scarcely have acquired the susceptibilities of States which have enjoyed an ancient independence. They all speak the same language and profess the same religion; and in many parts of the continent, since the date of liberation, States and provinces have been repeatedly divided and reunited. For some reason which is not generally understood, Chili has been more respectable and more prosperous than the neighbouring Republics; and its superiority has been conclusively established by the result of the present war. The South American States have sometimes recognized a kind of common patriotism, as when Chili and Peru jointly resisted the attempt of Spain during the Ministry of Marshal O'DONNELL to interfere with their independence. It is not known whether Chili has any partisans in Peru. Unless the bulk of the population is inclined to transfer its allegiance, the scheme of a permanent occupation of the conquered territory seems, as Mr. BLAINE justly says, to be inexpedient. It may perhaps be difficult to take security for any indemnity which might be stipulated between the parties. There is some force in Mr. BLAINE's contention that the first condition of peace is the institution of a regular and responsible Government. The added condition that it must also be constitutional is conventional and harmless. All South American Governments, since the overthrow of the despotism of LOPEZ in Paraguay, have been nominally constitutional. They are in reality for the most part administered by military adventurers under some transparent pretence of free election. If peace is made with any Peruvian President, it is important that he should be able to control his ostensible constituents.

A diplomatic despatch issued by the Government of the United States would seem to be incomplete if it were not decorated with some kind of defiance to the European Powers, which generally, though not always, are represented for the purpose by England. The peroration of Mr. BLAINE's despatch to the American Minister at Santiago is framed in accordance with established precedent. He thinks it necessary to consider how far the benevolent interposition of the United States "might be affected, and a more active interposition forced upon it [the "American Government], by any attempted complications "with European politics." There is no reason to suppose that Spain meditates any renewal of the injudicious enterprise of O'DONNELL; and it is difficult to imagine any other complication of the war between Chili and Peru with European politics. Mr. BLAINE's apprehensions more probably point to England, which has more important relations than those of Spain with the western coast of South America, as with other commercial regions. Both ordinary trade and the interests of English bondholders are injuriously affected by the present war; and the English Government would be fully justified in using any influence which it might possess to promote a peaceful settlement of the dispute. It is probable that the commercial relations of England with Chili and Peru are more considerable than those of the United States; and mediation or the employment of friendly offices could involve no complication with European politics. The pretension of exercising an exclusive control over the Republics of the Western hemisphere has never been conceded by England, nor, indeed, by any foreign Power. If the Government of the United States can induce the combatants to make peace, the result will be acceptable to England; but the same object would be equally welcome if it were attained by other means. It seems probable

that, since the arrest of President CALDERON, more active steps have been taken towards a reconciliation between Chili and Peru. Two special agents have been sent to assist or supersede the resident Ministers, and one of the new envoys is son of the SECRETARY of STATE. It might therefore have been conjectured that Mr. BLAINE hoped to effect a settlement before his own retirement from office, though the Chilean Government would perhaps not pay extraordinary deference to an outgoing Minister; but Mr. BLAINE has resigned without waiting to learn the result of his mission. His successor, Mr. FRELINGHUYSEN, will not formally retract any pretensions which may have been advanced by Mr. BLAINE; but it is possible that Mr. ARTHUR's policy may not be identical with that of Mr. GARFIELD.

#### PROTECTION IN GERMANY.

A PAMPHLET has been lately published at Berlin to which the English Board of Trade has accorded the unusual honour of publication in an abridged form as a Parliamentary paper. The authors of this pamphlet are clearly among those who are not without honour save in their own country. The one person who will not be impressed by their arguments is Prince BISMARCK. The high *a priori* reasoning in which the CHANCELLOR delights soars far above the tedious corrections supplied by facts and figures. He will not think the worse of his protective policy because the result from the first year's experience of its working has been to draw from an immense majority of the German Chambers of Commerce the most positive condemnation of the new tariff. The defenders of this tariff claim for it that it has been beneficial to German trade generally, and especially beneficial to certain trades of exceptional importance. In the preface to this pamphlet both these statements are denied. If there were any trace of trade improvement, whether general or particular, it would show itself in the annual Reports of the Chambers of Commerce. But, according to the greater part of these Reports, the improvement which was undoubtedly visible during part of the year 1880 was merely a phase of the revival of trade in all countries. This is shown by the fact that the improvement was greatest in the first six months of the year, when the action of the new tariff was modified by previous importations hurried forward to escape the impending duties. It was not until the second half of the year, when the supply of these exceptional imports was exhausted, that the results of Protection could be properly appreciated. Taking Germany as a whole, the general complaint is that in those second six months, when the remedy applied by Prince BISMARCK had really begun its beneficent work, the state of trade was far worse than it had been in the former part of the year. The truth is that Prince BISMARCK has not been able to make his protective policy sufficiently thoroughgoing. If it had been possible to protect all trades, he might at all events have had the whole of the producers on his side. As it is, he finds that the great majority of the producers are included among the injured consumers. The ironmasters, no doubt, declare that without the new duties they would have been worse off than they actually are. It may be noted, by the way, that this is the highest praise which the new tariff gets from any quarter. Nobody is any the better for it; only a few traders think that their present wretched condition would have been still more wretched without it. But then the numerous trades which have to buy iron, instead of selling it, tell a different story. They describe themselves as simply sacrificed to make the ironmasters richer. They are forced to pay high prices for native machinery, because foreign machinery is subjected to a prohibitive duty. In Germany, as elsewhere, there are many trades which are only able to undersell the foreigner in the home market if they have the benefit of free importation of cheap material and cheap machinery. Prince BISMARCK takes this indispensable advantage away from them, and in its place offers them a protective duty on their own goods. If he could compel the home consumer to buy these goods, the traders might be no losers by the exchange. As it is, however, the CHANCELLOR has merely given them a choice between two forms of ruin. They may either tack the duty on to their goods and see them remain on their hands, or they may go on selling them at the old prices, and see the whole of their profits

go to the Government in the form of duty. Either way there is nothing but ruin before them; and, in view of this prospect, they are not very ready to admit that the new policy has been a blessing to Germany because it has increased the profits of certain joint-stock Companies in the iron trade, or enabled the owners of coal-mines to employ more workmen and drive a brisker business.

This review of the present condition of German trade forms the preface to a series of extracts from the Reports of the German Chambers of Commerce for the year 1880. The Berlin Report speaks hopefully of what is to happen by and by, but it admits that as yet the expectations based on the new tariff have been signally disappointed. Protection, the Chamber declares, can only be beneficial when there is abundance of enterprise on the part of home manufacturers, which seems a little like saying that a wooden leg is of no value to a man who has got the full use of his limbs. In the other towns of Brandenburg, where the manufacture of cloth and linen are the chief industries, the future and the present are regarded as alike gloomy. These industries can only live by a cheap supply of raw material, and of this the new tariff has deprived them. West Prussia dislikes Prince BISMARCK'S policy heartily, as a province which depends for its prosperity upon its trade with Russia might be expected to do. The grain and timber trades seem to have suffered above all others. One Chamber reports that the immediate effect of the new tariff has been to pauperize the population. Another describes the existing trade depression as the necessary result of the new commercial regulations. From Westphalia and Rhonish Prussia we learn that a home demand, "the necessary factor" which can alone improve the local industries, is still wanting; and even the towns which declare themselves friendly to the new policy admit that prices were never so low as they were when the Report was written. Protection and low prices is a combination hitherto unheard of; and it is not one which is likely to recommend the policy which has created it. Conspicuous prosperity on the part of a few selected trades may blind the public to the low estate to which the rest have been reduced; but, when the trades for whose benefit the others have been ruined themselves complain that they were never so badly off as now, there is not much chance that the tariff which causes one of these results, while it leaves the other unremedied, will become generally popular. From Munich the same mixed cry comes up. The leather and paper trades are among the protected industries; but they only complain that they are not protected enough. The other trades are as much hampered as their Northern fellow-countrymen by the necessity of paying exorbitant prices for the raw material of their industries. Passau, in Southern Bavaria, is an exception to the general rule; since its Chamber expresses the utmost wonder that any one can be found to oppose the patriotic measures of "our unselfish CHANCELLOR." In spite of these measures, however, trade, even in Passau, is described as "deplorably stagnant."

The best testimony that can be brought forward to the truth and pertinence of this pamphlet is the effect which it has had upon Prince BISMARCK. The CHANCELLOR of the German Empire is also Minister of Commerce for the Prussian Kingdom. When he first became so, some curiosity was felt as to the motives which had induced him to take upon himself this comparatively subordinate office; now the wonder is explained. Prince BISMARCK became Minister of Commerce in order to exercise a moral censorship on the Prussian Chambers of Commerce. What Prince BISMARCK most deprecates in these bodies is prejudice, and the language of their Reports upon the new tariff has convinced him that many of them are not free from prejudice. Instead of giving independent judgments in favour of Protection, they have allowed themselves to give biased judgments against it. The PRINCE has already caused some of the worst sinners to be reprimanded for what they have done, and in future care is to be taken to withhold from them the opportunity of offending in like manner again. The sittings of the Chambers of Commerce are henceforward to be public, so that their ill-disposed members need not hope to be able to conceal their want of patriotism from the local authorities or from the central Government. Every man will speak as in the presence of Prince BISMARCK himself, and this of itself will greatly help a rash speaker to bridle his tongue, when that unruly member may so easily do him harm. If this is not check enough upon the mischievous independence of the

Chambers of Commerce, a still more effectual one will be found in the new regulation which compels them to submit their Reports to the Government before publishing them, so that the Government may amend them if necessary. There will be no more such pamphlets as that which has suggested these remarks. The Reports of the Chambers of Commerce for 1881 will show a beautiful unanimity in favour of the new tariff, unless it has pleased Prince BISMARCK in his inscrutable wisdom to replace it before then by a newer tariff still.

#### LANDLORDS AND TENANTS.

THE Annual Report of the Council of the Central and Associated Chambers of Agriculture shows that landlords and tenants are still capable of acting together for the defence and promotion of their common interests. It would be strange if the most important of all industries were incapable of the organization which is employed by other traders. Chambers of Commerce are not divided into hostile sections of wholesale and retail dealers. The Farmers' Alliance has, for the first time in England, set the example of association for the avowed purpose of plunder to be effected by political agitation. The Chambers of Agriculture are engaged in the more legitimate enterprise of watching and modifying legislation which may injuriously affect either owners or occupiers. The tenant-farmers, who probably form a large majority of the whole body, have apparently not been persuaded by Liberal orators that they have no concern with the distribution of local and general taxes. Mr. GLADSTONE lately informed them that the landlords alone would profit by a reduction of rates; and that the relief of a class of the community which is generally opposed to the present Government would be equivalent to the process of quartering the owners on the Exchequer. The blinding tendency of party hatred has never been more curiously exemplified. On the same principle every trader and every taxpayer who is relieved from an unjust burden becomes a public pensioner; but the fallacy of the proposition is not exhausted by an exposure of its wilful injustice. It is not strictly or universally true that in all circumstances local taxation is imposed on owners. New rates and additions to old rates fall upon the occupier, as in the instance of the heavy charge for the maintenance of Board schools. In spite of Mr. GLADSTONE'S assertion, the tenant-farmers in all parts of the country complain of the present incidence of local taxation. The increase of fifty per cent. in ten or twelve years must to a great extent have fallen on the occupier. Even the Farmers' Alliance would welcome present relief, until it has transferred the entire burden of taxation to owners, retaining for tenants the exclusive control of expenditure.

It was already known that the Council had rejected by a large majority a motion in favour of imposing duties on articles of food and manufacture imported from countries which imposed protective duties on English produce. The issue of fair-trade could not be more directly raised; and those who supported the motion can scarcely be blamed. Nearly all foreign writers and speakers on economic subjects take for granted the doctrines which were supported by the minority of the Council of Agriculture. If it is once assumed that the importation of cheap produce is a sacrifice on the part of the purchaser, it follows that the expediency of retaliation depends on special circumstances. It is probable that some of those who voted against the motion may have thought that retaliatory duties would be rather impracticable than undesirable. Imperfect acquaintance with economic principles is not incompatible with political good sense. The Council probably knew that it was impossible to resuscitate the extinct Corn Laws, even in a modified form; and farmers could have no motive for protecting manufacturers against foreign competition. The list of the Council includes the names of some sturdy and honest protectionists, who still resent the triumph of the Corn Law League; but the decision of the whole body contrasts favourably with the language used by some ill-informed and imprudent members of Parliament. The object of a paragraph in the Report on the renewal of the French Commercial Treaty is not at first sight obvious; but sheep-farmers have an interest in the French duties on woollen yarns and goods, as far as they supply the raw material for the manufacturer. The Council also refers

to the indirect injury to agriculture which may be caused by an increase of protective duties in France; but any interest which farmers may have in the pending negotiations will be sufficiently represented by the traders who are more immediately concerned, and by the Chambers of Commerce. An attempt was made at the instance of one of the provincial Chambers to protest against the disuse in certain fabrics of home-grown wool; but effectual interference with the caprices of fashion is beyond the power of any Association. Some years since the trade of Coventry was almost destroyed by a change in the form of bonnets which suddenly checked the demand for ribbons. If ladies prefer any other material to home-grown wool, they will wholly disregard the interests of flock-masters. The PRINCESS OF WALES was well advised in declining an invitation to give direct encouragement to native industry.

The Council naturally approves of the notion of Sir MASSEY LOPES for the appointment of a Minister of Commerce and Agriculture. The Government has accepted the proposal, and sooner or later a change will probably be made in the title of the President of the Board of Trade. It will be neither necessary nor convenient to attempt any corresponding alteration of his functions, unless the superintendence of measures for the prevention of animal disease should be transferred from the Vice-President of the Privy Council to the rechristened Ministry. As the Council of Agriculture expresses its satisfaction with the precautions lately taken by the Privy Council, the reasons for changing the mode of administration appear not to be immediately urgent. It is not easy to discover any other function which could be usefully undertaken by a Minister of Agriculture. The collection of statistics can scarcely require a superintendent with a seat in the Cabinet, especially as the Council acknowledges with gratitude a recent undertaking of the Foreign Office to furnish it with early copies of all important information relating to foreign agriculture. If the number of Cabinet Ministers is not increased, there seems to be no objection to the creation of a title which will perhaps satisfy landowners and farmers that their interests are duly considered by the Government. With a laudable desire to promote the interests of agriculture, the Council has recommended the Universities to establish agricultural professorships, and it acknowledges certain steps which have been taken by the Government to promote scientific instruction. The suggestion that agricultural chairs should be instituted at Oxford and Cambridge seems to deserve attention; but it is not known that either the Commissioners or the University authorities have taken the subject into consideration.

The Council approves of the principles of the Bills providing for compensation to tenants which were respectively introduced by Sir THOMAS AGLAND and Mr. CHAPLIN. A preference is expressed for Mr. CHAPLIN'S Bill, which was founded on the Lincolnshire custom. It is undoubtedly just "that every tenant on quitting his holding shall be compensated by law, by custom, or by agreement"; but the landlord may, through careless or sentimental legislation, be exposed to great injustice through partial valuations. A scale of payment for artificial manures applied to the land within a certain time before the end of the term may be fairly fixed, and the expenditure of the tenant may be proved by proper vouchers. A general valuation would often result in a charge for improvements which had never been effected. In many cases the outgoing tenant leaves the farm in a dilapidated condition, for which the landlord seldom receives compensation. It has lately been stated, on good authority, that in districts where the local custom provides for compensation the rights of the landlord are habitually disregarded. It is satisfactory to find that an agricultural association can deal with the question in a moderate spirit, and without any suggestion of robbery. The Farmers' Alliance insists on compensation mainly for the purpose of laying a foundation for the acquisition without purchase of a tenant-right. The Council deals in the same temperate manner with the question of distress for rent. The proposal that the landlord's power to distress should be limited to two years is reasonable or plausible; and it is just that hired machinery should be exempt from distress; and perhaps that a similar privilege should be allowed to agisted stock. The cases in which the occupier would deliberately abstain from keeping any stock of his own would probably not be numerous. It would be tedious to enumerate all the questions affecting the interests of agriculture with which the Council deals in the Report.

In all cases its objects are evidently practical, and from the beginning to the end of the Report there is no trace of political partisanship. If Mr. GLADSTONE should condescend to read the document, he will probably despise the sordid, unfeeling, and spiritless tenants whom "no sense of wrong can urge to vengeance"; but perhaps they may be forgiven by less zealous philanthropists for attending to their own business, for considering how existing grievances may be remedied, and even for remonstrating against what they regard as an unjust incidence of taxation.

#### THE CANONBURY ACCIDENT.

THE official inquiry into the Canonbury accident has almost necessarily—at least up to this time—taken the form which is of least interest to the public at large. Two Companies are concerned in the large compensations which will probably have to be paid in connexion with it, and the proximate cause of the accident seems to have been either the directions given by a signalman belonging to one Company or the interpretation affixed to these directions by a signalman belonging to another Company. The incidence of blame as between the two signalmen will determine in a great degree the incidence of compensation as between the two Companies, and a great deal of the evidence is naturally directed to shift this burden from one servant to the other. This is not a point about which it is worth while for the public to concern themselves. What really touches that large class of persons who are compelled to travel every day by railway in order to get from their homes to their business and from their business back again to their homes is the state of things which this accident discloses as always existing on the North London, and possibly on other suburban lines which have a similar pressure on their resources. That state of things is this. An enormous number of passengers have to be brought into London every morning within very narrow limits as regards time. To meet this necessity trains are run at intervals of about three minutes. If the driver of a train could see far enough ahead, he might go slowly enough to be able to pull up in the event of the train in front of him coming to a stand. But these lines are not constructed so as to give drivers this advantage. They have many curves, many cross rails, and, in the case of the North London Railway at the point where the accident happened, a very awkwardly placed tunnel. Consequently the driver has no means of correcting or supplementing the information given him by the signals. He must walk by faith, not by sight. Everything, therefore, depends on the character of the system by which this indispensable information is conveyed to him, and what that character is at Canonbury the evidence taken at the inquiry has sufficiently shown. The movements of the trains are guided by a signalman placed at each end of the tunnel—one in the service of the Great Northern Company, the other in the service of the North London Company. These men have been trained in different codes, and either of them may consequently speak a language which the other can only interpret by constant reference to his dictionary. These are what may be called the special conditions which brought about the accident, and it is hard to understand how the Companies can have hoped that under these conditions an accident could long be avoided. To unlearned persons it would seem a matter of absolute necessity that where two Companies use the same lines and the same signals, the method on which these signals are worked should be the same. Even if the servants of the two Companies are equally well trained in both methods, the having to change from one to the other according to which the next signalman chooses to employ would be an unfortunate addition to labours which are already more than sufficiently exhausting. But it is plain that the servants of the two Companies are not equally well trained in the use of both methods. In this particular case one signalman had to refer to the code before he could satisfy himself what a signal meant, and when a reference of this kind has to be made with trains coming on every two or three minutes, and with signals having to be asked for, acknowledged, and given every minute, it is easy to see how likely the explanation in the code is to be misinterpreted. This is the first lesson of this accident. The code of signals of two Companies which use the same line for any part of

their system should be the same for both. Nothing short of this can give the requisite certainty that a man who only knows one code perfectly will not find himself in a box where he is expected to know both.

The second obvious warning conveyed by the Canonbury disaster is the impossibility of placing entire confidence in human agency in the matter of signalling. It is true, no doubt, that even machinery may get out of order. But it is much easier to detect a fault in machinery than it is to detect it in human beings. A signalman may be ill, or drunk, or tired, or absorbed by some private trouble, and nobody may know it. But, if an accident happens to machinery, and an arm does not work, or a lamp change its colour at the right moment, there are many eyes likely to take note of it. The great advantage, however, of mechanical over human agency in the matter of signalling is that, so long as it is in working order, no accident can happen, provided only the most ordinary caution is taken by the drivers of the trains. Even in the simplest form of this mechanical agency the increase in security is very great. Supposing, for example, that the first of the trains which came into collision at Canonbury had, by the mere fact of its passing over a particular point in the metals, set the signal at danger when it entered the tunnel, and that there had been no possibility of that signal being moved until the same train had moved over another point in the metals beyond the tunnel, there would have been no room for misunderstanding between the signalmen. So long as a train had been in the tunnel every following train must have remained outside it. There are other and more perfect forms of security to be found than this, but in railway travelling it is eminently true that the better is the enemy of the good. When there are several rival inventions in existence, it is only natural that a Company should wish to take the best, if it takes any. But the law ought not to allow it to abstain from taking any on the plea that it wishes to take the best. By all means let it exercise its choice between one invention and another; but the State has a right to insist that it shall be a choice between alternatives, not an impartial rejection of all of them. The work which has to be done by the signalmen on the North London line and on many suburban lines is of a kind that no man can be sure of doing without making a blunder some time or other. The cleverest performer will occasionally make a slip; and, where railway signals on a crowded suburban line are concerned, a slip may easily mean what it meant at Canonbury the other day.

There is a third precaution, which, though of inferior importance in itself, might, as it happens, have saved the lives and limbs of many persons last week. When the first train stopped in the tunnel, many of the passengers knew and dreaded the nature of the danger which was hanging over them. If they all had been able to get out of the train and walk along the line in front of it, they would have escaped the collision. No train could have overtaken them on the up line except the one out of which they had got, and the driver of this train would have known that his passengers were in front of him, and would have been able to come on with proper care to avoid running over them. But the total darkness, which is the normal condition even of suburban tunnels, prevented many of the passengers from doing this. If the tunnel had been lighted, those travelling in the first train would have been almost as free from danger as if the delay had taken place outside the tunnel. As it was, they were in darkness, and consequently unable to leave their carriages. In the abstract, indeed, it may not be desirable to have railway travellers scattered over a tunnel through which trains are passing every two or three minutes; but, at all events, it is better than having them shut up in a train into which other trains are running every two or three minutes. It is true that the precaution of lighting the tunnel would only have saved the passengers in the first train; but it is something to lessen the dimensions of an accident if it cannot be altogether prevented.

It is well, perhaps, that this loss of life should have happened in London rather than elsewhere, for the simple reason that attention is the more likely to be paid to the causes to which it is due, and to the means by which they may be removed. Nowhere are there so many persons interested in the safety of railway travelling as in London, and of these the great majority are especially in-

terested in railway travelling on suburban lines. It is to be hoped that the Board of Trade will not neglect the opportunity which is thus afforded it.

#### A DAY CENSUS OF THE CITY.

THE object of the Imperial Census is to ascertain the population of the United Kingdom at a given date. For this purpose an account is taken of the number of people sleeping in each locality during the night which is selected as the basis of the Census. In this way the proposed object is attained with as much accuracy as is possible, and with sufficient accuracy for all practical purposes. So long as each man, woman, and child is registered in some locality, and not in more than one, it is wholly immaterial how it happens that the person registered has come to sleep in the locality where he is enumerated as having slept. If he sleeps at Croydon, he is registered there as a unit of the population, without any reference to what he did in the daytime before he went to bed. If the Census is used for other purposes than that which it was intended to serve, it is naturally misleading, although, strictly speaking, it is not the Census that misleads, but the ignorance of those who misapply it. It may, for example, be used as a guide to the total permanent population of any one locality. But before it can be so used, those who seek to use it must place before their minds the question which the Census cannot possibly answer for them, what it is that they mean by population, and what are the special circumstances of the locality. If they want to know how many people find something to do in the locality within any period of twenty-four hours, they must have a singular capacity for being misled if they think that they can find out what they want by merely ascertaining how many people slept there on any given night. Even the schoolboy of real life, who may be taken as a fair average representative of human perception, would be able to tell them that everything depended on the peculiar character of the locality. In a country parish where the farms happened to be all in the parish, and the labour of the parish sufficed for its wants, the number of persons sleeping in the parish might correspond almost exactly with the number of persons who had been in the parish within twenty-four hours. In a large town into which thousands of persons crowd during the daytime for business or pleasure from the suburbs or the country, the number of persons sleeping in the town would be no kind of guide to the number present in the town during a space of twenty-four hours. The authorities seem, however, to have discovered, or to apprehend, that there are people in England more stupid than the most stupid schoolboy. These people are taken to be misled by the Census, and to be capable of judging the day population of the City, into which it is notorious that hundreds of thousands come from morning to evening, by the night population of the City, in which it is notorious that very few persons sleep. These unhappy calculators will, it may be hoped, have their error corrected by the very elaborate Report which the City authorities have published. The larger number of readers of the Report will find in it, not so much a safeguard against error, as a repertory of most valuable and interesting facts as to the daily incomers, the vehicles used, the buildings and the wealth of the City. Everybody knows that enormous numbers come daily into the City, that those engaged on business find numerous tenements to shelter them, and that the wealth of those who do business in the City is very great. But few who read this Report will previously have had any accurate conception as to how many hundreds of thousands come in daily, how extensive is the accommodation for business purposes, and how gigantic is the wealth of those who do business in the City.

The number of persons who slept within the City boundaries on the night of April 4 was 50,526. For the purposes of a general Census nothing more was required to be known. But the City authorities wished to know something more. They wished to know how many persons on a given day were employed in or were on some City premises; and, by a calculation which very great pains were taken to make exhaustive, it was found that the total number was 261,061 persons. Of this number, there were over 50,000 employers and over 162,000 employed; and the balance was made up of children and of persons in charge

of the premises. If the population of the City is to be taken as that which gives or finds employment there; the size of this population is brought home to us when the framers of the Report remind us that this population is greater than the population of no fewer than sixteen English counties, and places the City sixth in the list according to population of English Parliamentary boroughs. The Committee of the Corporation next proceeded to ascertain how many people come into the City on a day, and for this purpose they stationed two policemen at each of the sixty entrances, including railway stations, by which the City is approached, and they found that the total amount was as nearly as possible 800,000, and that about 70,000 vehicles were employed. This is certainly one of the most curious and astonishing results that is offered us, and it may be remarked that nothing could testify in a more striking manner to the efficiency of the City police than that this vast tide of human beings and vehicles should roll on hour after hour without hindrance or confusion. The police administration of the City is as nearly perfect in every detail as anything human can be, and among other things it deserves to be recognized with gratitude that in the vast expanse of London mud the City offers an oasis where the streets are always clean and the roadway always in good order. The vastness of the increase of the business of the City is also illustrated by the fact that a similar calculation as to the number of employers and employed was made sixteen years ago, and that 90,000 is the increase that is now found to exist. Most of the business premises of London are let in flats; and thus, while the total number of inhabited houses is about 6,000, the number of distinct premises used for business is four times as great, and it is thus shown that on an average about ten persons find occupation in each of these premises. The rateable value of the City is  $3\frac{1}{2}$  millions, or not far from double of that of any other metropolitan district, the next to it being the district of St. George's, Hanover Square, where the rateable value is almost exactly 2 millions. The net profits on which Income-tax is paid in the City nearly reach the enormous figure of 40 millions, out of a total of 80 millions returned by all the divisions of the metropolis. Half the wealth of London may be said, therefore, to be concentrated in the narrow boundaries of the City; and this is perhaps not very astonishing when it is remembered that the City represents in some degree the wealth not so much of London as of the world.

The Committee state that they have studiously avoided expressing any opinion on the various plans which have been propounded for extending the area of the City, or for incorporating with it or by themselves outlying portions of the metropolis, as these matters do not come within their province. But it is obvious that their Report is meant to have, and ought to have, an important bearing on the questions they do not discuss. It is because they are afraid that persons, misled by the Census, will think the City something small that they show the City to be very big. It is, in short, so big, so populated by employers and employed, so crowded by daily incomers, so rich in business premises, is assessed so highly, and pays such a vast amount of Income-tax, that it is entitled to stand alone, a sufficient centre of self-government without additions, and too important to be merged in a vast unwieldy body. If this is the point the Committee wish to prove, the figures they have collected go far to prove it. The unique eminence of the City, its noble historical traditions, the part it has played for centuries in the history of England, afford the most cogent reasons for keeping the City as it is, and not merging it in a Board governing the whole metropolis. Next in importance is the efficiency of the City administration. We know that one part of London is well administered, and we could never be sure that equal efficiency would be attained under a different system. There is at least as much chance that the rest of London would spoil the City, as that the City would improve the rest of London. But the Report of the Committee introduces another class of arguments which are certainly deserving of the most serious attention. English politicians of every school agree in praising and upholding local self-government; and it is as a glorious extension of local self-government that the proposal to unite all the metropolis under one administration is advocated. But there is a preliminary question that needs to be settled, and that is whether

local self-government may not be killed by being extended. Local self-government means that within a certain area men govern themselves in all matters which they have in common, because they meet within this area. The use of this kind of government is to gain experience in practical politics, to instil a habit of united action, and to offer a counteracting principle to the despotism of centralization. Within areas of a certain size, these valuable results may be obtained, but experience warrants the supposition that the areas of local self-government cannot be indefinitely increased. Those in the area would not manage their own affairs; for the affairs they would be supposed to manage would be too vast for them to understand; they would gain no habits of united action; they would not be self-governed, but would live under the despotism of a new centralization. It may, therefore, be reasonably contended that, when once an area of local self-government is sufficiently large, whether in size or in the importance of interests centred in it, to bring self-government to its maximum of efficiency, it ought not to be extended or merged; and the Report of the Committee may be taken to show conclusively that the City is an instance of an area of self-government which reaches the limits of what the area can be if its local self-government is to be efficient.

#### THE RECENT CANONIZATIONS.

THE grand ceremony of canonization celebrated at Rome last week in the Great Hall of the Basilica of St. Peter's was chiefly remarkable, as a ceremony, on two grounds. In the first place it was far the grandest pontifical function witnessed at the Vatican since 1870, and may so far be regarded as at least a partial abandonment of the imprisonment theory. The Pope for the first time, to quote the rather strange phrase of the *Times*, "exercised his Papal authority at a high altar, as his predecessors in St. Peter's have done." He was borne aloft on the *Sediv Gescalatoria*, surrounded by the Noble Guard and attended by 33 Cardinals and 150 Archbishops and Bishops, and the prescribed ritual was observed in all its fulness, with the sound of the silver trumpets not heard since 1870. This new move was rendered the more noticeable from the pomp with which the Ambassadors and Ministers accredited to the Holy See went to the Vatican to take part in the solemnity, and especially, we may add, under existing circumstances, from the presence and active concurrence of the French Ambassador. Not only did M. Desprez attend the ceremony, accompanied by the whole personnel of his staff in state carriages; he also gave a grand banquet on the occasion to the French prelates in Rome at the Colonna Palace, when in proposing the health of the Pope he pronounced an elaborate eulogy on the virtues of the episcopate and clergy of France. And this is the more noteworthy when we remember that M. Gambetta's organ the other day characterized one of the personages just canonized as "a dirty and incorrigible vagabond," and that M. Paul Bert has written to these very bishops censuring their neglect of the provision of the Concordat—never enforced of late years—which requires them to obtain permission of the Government before leaving their dioceses. The incongruity may serve to illustrate what we said the other day about Concordats being made between the Pope and the Government over the heads of the national episcopate, but that by the way. The second point calling for notice in the ceremony of canonization, besides its splendour and public and official character, was the entire absence of any such matter of provocation as had in some quarters been anticipated. That the Pope should make a lamentation at such a time over the unhappy condition in which the Holy See finds itself, and urge the duty of all good Catholics to rally round it, was natural enough. What is more important, and what indeed might have been expected from his known temper and antecedents, is that he did not verify the predictions of the *Diritto* by putting forward an assertion of his temporal power and fulminating excommunications against its assailants. The celebration cannot therefore be said, except in the indirect sense already suggested, to have had any political significance. Its religious meaning is likely of course to be very differently appreciated by various classes of thinkers within and without the Roman pale. There are many intermediate stages between the scornful sneer of the *République Française* at St. Labré as a dirty vagabond and the enthusiastic sympathy formally expressed by the French Ambassador and probably felt by many of his hearers. But few thoughtful persons are likely to treat the matter merely as a theme for ridicule. The idea which underlies canonization—whatever may be thought of that particular expression of it—is one closely connected with the doctrine of "the Communion of Saints," and has existed from a very early period in the Church, when the persecuted Christians were wont to collect and preserve with reverence and affection the remains of those who had suffered for their faith. And there appears, from what St. Jerome tells us, to have been, long before any regular practice of invocation was established, a prevalent belief that the souls of these martyrs hovered about the place where their bodies were laid and were there somehow brought

into contact with the living. Of the four persons canonized the other day there is little to say except that they were poor and humble individuals, more distinguished by their charity and self-denial than by any great service they can have rendered to the Church. And this is so far to the credit of those concerned, as there can hardly have been any interest of wealthy and influential patrons brought to bear on the Court of Rome in their favour. But the custom itself, of which so conspicuous an example was exhibited on that occasion, is one on which a few words will not be out of place.

The practice of honouring martyrs came, as has already been mentioned, very early into the Church, earlier probably than the cult of angels with which Milman connects it. The Saints being themselves human appended more directly to human sympathies, and the doctrine of the Communion of Saints was held to imply some permanent and intimate relation between the faithful on earth and the faithful departed. It implied, as Milman puts it, the Church militant and the Church triumphant as forming but one polity, and implying that there was a real and living sympathy between the two. The departed were believed still to take an interest in their old friends and the affairs of their earthly home, and to exercise through their intercession a beneficent influence over them. And thus, as time went on, Saints were multiplied, until their separate claims might seem almost to be imperilled by their multiplicity. The Calendar was rapidly filled with fresh names till few days were left vacant, and some days were burdened with an accumulation of—we will not say rival but many—saints, who had to share their honours as best they could. East and West vied with each other in this process, the Greek menologies however being the more copious of the two, but few comparatively of the countless host of Eastern Saints obtained any direct recognition in the West, while the Orientals were content for the most part with their own. Nor was this all. Different countries and indeed cities had their special heroes and patrons. It has been said, with some exaggeration doubtless, that "in Germany alone each kingdom or principality, even every city, town, or village, had its own Saint." "For at first popular admiration enjoyed for some time unchecked the privilege of canonization. A Saint was a Saint, as it were, by acclamation." That was the beginning of canonization, though the name as yet did not exist, but gradually, as these local and other cults came to multiply beyond all measure, the Popes assumed to themselves the sole prerogative of advancing claimants to the successive ranks of Beatitude and Sanctity. The canonized Saints henceforth held no merely local or precarious dignity; they were presented in solemn Bulls and with rites of imposing splendour to the general homage of Christendom. And it was certainly time to impose some limit on popular or episcopal licence in this matter; if ever the vast undertaking of the Bollandists is completed it will comprise the histories of more than 25,000 Saints, and yet this only professes to be a selection of what is of Catholic rather than purely national interest. On the other hand, only 115 persons had been formally canonized by the Holy See before the reign of Pius IX. There are those, of course, like the Apostles, the early Martyrs, the four "great Doctors" respectively of East and West, and some other conspicuous Bishops, confessors and founders of Religious Orders who may be called the Saints of the universal Christian world. But down to the tenth century the popular voice, with the sanction of the Bishop, was held to be sufficient authority for conferring the honour; after that time the sanction of the Pope was required, though Bishops still for a time retained their initiative. The first recorded canonization, in the modern sense of the word, was that of Ulrich, Bishop of Augsburg, raised to that honour by a Bull of John XV. in 993 at the request of Liutolf, his immediate successor in the See, who had however already established public veneration for him in his own diocese. Pope John explained in an Epistle that this usage was introduced in order that by honouring Martyrs and Confessors we may worship Him of whom they testified, and being conscious of our own imperfections seek the aid of their merits and prayers at the throne of God. But it was not till two centuries later that the prerogative was assigned exclusively to the Holy See by Constitutions first of Alexander III. and then of Innocent III. The canonization of St. Gaultier of Pontoise by the Archbishop of Rouen in 1153 is the latest example of such an act being accomplished by any lower authority. Innocent III. finally laid down that the decision of such matters appertained exclusively to the legitimate successor of St. Peter, being partly moved thereto by the scandal caused some thirty years before through the canonization of Charlemagne—rather a questionable Saint, in spite of his immense services to the Papacy—by the Anti-pope Paschal III., and the insertion of his name in some Gallican breviaries. The first canonization solemnized with anything like the present ritual pomp was that of St. Francis of Assisi in 1228. It was not till fifty years later that the regular process, since developed into a minute and searching investigation of the merits of each individual case, was first exemplified in the canonization of St. Raymond of Pennafort. The question of the infallibility of the Pontiff in these high official acts, long hotly debated between the ultramontane and the opposite school in the Roman Church, is still, we believe, a moot point. Its decision in the affirmative would hardly tend to facilitate the acceptance of the Vatican decrees.

A more interesting question, at least to outsiders, than any concerning the mere formalities of the official process, but one too wide to be more than glanced at here, is the rationale, so to call it, of the custom, the idea from which it sprang and to which it owes its

continued vitality. It is not enough to say that it grew theologically out of the doctrine of the Communion of Saints. No usage, however consistent with received dogmas, would have attained anything like so widespread and permanent a hold on the popular mind that was not rooted in some deep instinct of human nature. Nor is the explanation far to seek. From age to age the methods of enrolling new Saints might vary, as again the method of electing Bishops varied, being left at one time to popular suffrage, and claimed at another for prelates or popes. But whatever might be the conditions of enrolment in this illustrious brotherhood, the fact remains that, as a modern writer expresses it, "for fourteen centuries the religious mind of the Catholic world threw them (the Saints) out as its form of hero-worship, as the heroic pattern of a form of human life which each Christian within his own limits was endeavouring to realize." Neither indeed can the sentiment thus indicated be justly confined to the first fourteen centuries or to any one form of Christian belief. What works like Alban Butler's *Lives of the Saints* are to Roman Catholics, religious memoirs and biographies and *Lives of Eminent Christians* have proved to the most anti-Roman section of Protestant. And the explanation in either case is at bottom substantially the same. If Protestants do not invoke Saints or erect their images over altars, they recognize not the less the practical value of great examples, and cherish a devout and reverential memory of the departed worthies of their own communion and creed. Neander, while commending the vigorous resistance of Rutherius, Bishop of Verona in the tenth century, to the sensuous and superstitious tendencies of his age and the insatiable craving for miracles, adds that he also discerned in the reaction against Saint-worship a dangerous "misapprehension or disregard of the Christian element, in the consciousness of the ennoblement of man's nature by being raised to the fellowship of a Divine life, betraying some approach to an abstract Deism," and that "in opposition to this tendency Rutherius, the antagonist of superstition, defended the worship of Saints." The word worship is too strong for the passage quoted from Rutherius, vindicating a Latin hymn for All Saints Day, but it is not difficult certainly "to recognize in his obscure and awkward style the antagonism of a deeply-felt Christian theism to an abstract deism." We only refer to it here as illustrating the agreement of religious minds of very diverse doctrinal tendencies as to the importance and benefit of dwelling on saintly examples. Man is a creature of imitation, and is sure to choose for himself models of some kind or other to emulate, whether criminals, heroes, or saints. It is to the religious application of this tendency in human nature that we owe both the Roman and the Protestant varieties of hagiology. Only what in the one case is mainly left to individual taste or preference was sure in a highly organized and dogmatic system to be sooner or later reduced to some authoritative standard. We may smile at the quaint ceremonies, dating from at least five centuries ago, reproduced the other day in the form of canonization at the Vatican—the silvered or gilded loaves and barrels of wine, the curiously wrought birdcages, containing doves, pigeons, and goldfinches, and "the five splendidly painted wax candles." But the fundamental idea these strange devices are supposed to illustrate lies deeper than any differences of Christian or, indeed, theistic faith.

#### TO BE LET OR SOLD—AN EMPIRE.

COMMON fame, according to a well-known saying, is a common liar; and it is much to be hoped that this saying is true at the present moment. For there seems to be a general idea among the nations of the earth that the British Empire is to be let or sold in lots to suit the convenience of purchasers—no reasonable offer refused. We have not heard how the Gibraltar subscription is progressing in Spain; but plenty of new projects have been started elsewhere to keep it company. The most definite is the reported application of Germany for the cession of Heligoland. This, of course, like the cession of Gibraltar, is nothing new. Heligoland has always been an eyesore to those patriotic Englishmen who are never so much deserving of the name of John Bull as when they see the red spots dotted about a map of Europe or of the world. It is said that we never had any business with it; that we never used it, except as a smuggling depot—a familiar reproach, used also in respect of Gibraltar; that we ought to have given it back to Denmark at the Congress of Vienna. It is only a sandbank tied on to a rock; a kind of inferior Capri; or, to speak less apotisingly, a Flat Holm and Steep Holm combined in one island. A few sea-bathers, a few fishermen, a great many birds which knock themselves against the lantern of its tall lighthouse on their annual migration, and occasional adventurers who set up roulette tables, and are winked at till British justice and morality wake up and swoop upon them—these are the only beings living to whom Heligoland is of any interest. Besides, it costs something—nearly a thousand a year, we believe—and that is a serious matter; it would pay an extra Sub-commissioner in Ireland. Moreover, it irritates Germany, which is a more serious matter still. All these reasons have long inclined the moral British Radical to look at Heligoland with an unfavourable eye; and perhaps there is another which is stronger with him than all of them. Heligoland is a standing reminder of the period when England was not a *puissance qui commence à rendre*—was something

very different from such a *puissance*. So it is said, very likely on no particular authority, that Count Munster thinks there will be no difficulty about its cession. Why should there be? We are quite in the way of ceding, and Heligoland is such a little place that it will never be missed. It is possible, however, that there may be some people who will take note of certain things. One is that Heligoland has no sort of business to belong to Germany, even if we carry out the principle of the moral barrier so conscientiously as to cede the Channel Islands to France. Another is that the Heligolandians are by no means likely to wish to exchange our easy yoke and light burden for Prince Bismarck's taskmastership. But there is a third of more importance than either of these. Germany is now a maritime Power, formidable in no slight degree; and a certain estuary called the Jahde and a certain port called Wilhelmshafen are the chief signs of that formidableness in an offensive sense. Now Heligoland, as a post of observation, commands the Jahde and Wilhelmshafen most completely. If it is English, and is united by cable to England, nothing could well stir from the modern Antwerp without being at once noticed and the news transmitted. This, of course, is the reason which makes Germany so anxious for it; and it need hardly be said that this is the reason why no sane English Government would let it go. There is, of course, no reason beyond newspaper gossip for believing that the present Government intends to let it go; but the rumour is proof positive of one thing, and that is that the present is thought to be a very convenient time for making offers, as they say in the exchange columns of ladies' newspapers. A kind of impression exists abroad that the outlying portions of the estate of John Bull may be had cheap by an enterprising speculator, and that possibly the opportunity may not recur.

The curious proceedings which seem to be going on in the Pacific are rather instructive commentaries on this general impression. It is true that the islands which French captains are reported to be annexing, after the fashion of an early discoverer, are not exactly British property. Many of them, however, have always considered themselves—especially since the French aggression on Tahiti—as under a kind of quasi-protectorate on our part, and the reported action of the French is in manner particularly cool. The natives are told to send their produce in future to Tahiti instead of to Auckland. As scandal asserts that very little of the trade of Tahiti itself is in French hands, the proceeding may not in the long run be calculated to send up the total returns of French trade very appreciably; but the intention is everything. However, the mere annexation itself, which seems to be only in a state of menace, is not so interesting as the conditions under which political gossip says that it is being carried on. Generally speaking, nothing can be so much wished as that European nations, no matter of what flag, would have the goodness to let the islands of Polynesia alone. We certainly have made a start over all other nations, except Spain, in our government of Fiji, which contrasts satisfactorily with the desolation brought by the French on the Marquesas. But we cannot be said to have, on the whole, conferred a benefactor on the islands in the person of Captain Cook. However, it is too late to make moan over this. The point of interest is that the few dozen islands which are to receive the blessings of the tricolour, and share in the East with Tunis in the West the glory of exhibiting the first fruits of the revived energy of France, are said—doubtless quite falsely—by the aforesaid gossip to have been the subject of a bargain between the English and French Foreign Offices. Absurd pretensions have been recently made by France, not merely to fishing rights, but to a kind of sovereignty over part of Newfoundland. These pretensions are, say the quidnuncs, to be abandoned on condition of Lord Granville's winking at the absorption of Raiatea and its neighbours into the dominions of the French Republic. The bargain is in itself a strictly equitable one; for it consists in the exchange of non-existent commodities. France has no rights in Newfoundland to surrender, and England has no property in the Society Islands to give. "Give me of what thou hast, and I will give thee of what I have," has been said to be the foundation principle and simplest term of trade all over the world and in all ages. But "Give me of what thou hast not, and I will give thee of what I have not," is a new and very interesting general principle. Perhaps it may be said to be the first principle of credit? It is not, however, easy to conceive any Government which retained the slightest respect for itself compromising a question affecting its own sovereign rights by the abandonment of independent communities who owe it no allegiance, but who trust in it for protection. No doubt the English Government has done nothing of the sort. But, as before, the rumour is at least sufficient evidence that somebody thinks it not impossible that it should do such a thing. So the Gibraltar subscription was, no doubt, a "flam," and the serene confidence of Count Munster in the approaching generalization of a *camard*, just as the French admiral and captains who go about planting tricolours and diverting the course of trade are perhaps creatures of the imagination, and certainly are mistaken in their views of Lord Granville's probable conduct. But all these idle suggestions remain as evidence of the ideas entertained by Spaniards and Germans and Frenchmen of the attitude of the present Government of England towards the great Empire of which it is the temporary steward. In this sense the much-abused axiom, that there is no smoke without fire, can certainly be affirmed without outraging reason or morality.

The next question to be asked is, whether these benighted foreigners may not possibly have some excuse for their outrageous

credulity? Nothing has been more edifying than the extreme delight shown by English Radicals at the language of the Duke de Broglie and M. Gambetta about the Transvaal. Almost are they persuaded to bless the Duke, who used to rank a little above Lord Beaconsfield in their estimation; while to see Mr. Gladstone *laudari a laudato* has made them very nearly weep with joy. That Mr. Gladstone was only a stick in the Duke de Broglie's hand to beat M. Gambetta with, and that M. Gambetta could only avoid the beating by gracefully extracting the wand from his adversary's fist, and flourishing it himself, does not seem to have occurred to them. But it may be fully granted that Frenchmen and Germans, and all other Europeans—not Europeans only, it is to be feared—have quite mastered the lesson of the Transvaal. Mr. Gladstone, they know, entered on his Government with contemptuous descriptions of this small little island, and gloomy shakings of the head over the load of foreign possession it had to bear. What more natural than that, as a wise and consistent statesman, he should make the god Terminus step backward? If the word is "scuttle," even when nothing is to be got by scuttling and much lost, how much more should it be so when not much is to be lost and something to be got? Such is the logic of the benighted foreigner. He sees in Afghanistan and the Transvaal simply the announcement which stands at the head of this article, and, like an honest and business-like person, he puts money in his purse and makes his bid for the various pieces of accommodation land which happen to suit him. Fortunately, the present Cabinet is composed of excellent men of business, and they know us well as Messrs. Pattick and Simpson when they have to sell a big library, that it does not do to fling too much on the market at once. In the very size of the British Empire there is therefore safety, and it is possible that some small fragments of it may, after all, go down to our sons either from sheer want of buyers, or because the sellers have not had time to sell to their liking. It takes a great deal of energy to squander completely the work of so many centuries. This is the chief comfort, but there are also others. It is doubtful after all whether a mere sale—a "trade" on even terms—has the peculiar attraction which Mr. Gladstone demands in these transactions. There is nothing in connexion with Heligoland, or Gibraltar, or the Pacific to give the thing the relish added by Majuba and Maiwand. In some of these cases, it is true, there are other relishes of a not dissimilar kind, but still the kind is not the same. On the whole, therefore, until official intelligence confirms the rumours, it will be well to disbelieve them all. Let us all be happy in the thought that the Heligoland fishermen will still be looked down upon by the Union Jack, instead of the black, white, and red ensign; and quite sure that Lord Granville would never think of abandoning the interesting Polynesian who trusts in him. If it is a difficulty for anybody to be jolly under these encouraging circumstances, he can remember that, at any rate, all Europe thinks his present governors perfectly capable of the various dubious acts attributed to them whether they are or not. That is a very pleasant reflection, and calculated to console the despondent. Wrongful suspicions directed towards the Ministers of other countries usually suspect them of wishing to do good to those countries in some irregular way. Could there possibly be a greater triumph for British eccentricity and originality than that similar suspicions, when directed towards an English Ministry, imply that it is ready at any moment to do its country harm?

#### FIRES IN THEATRES.

STATISTICS show that the chances of a theatre being burnt down while spectators are in it are extremely small. Although theatres have so often been consumed by fire that burning is frequently spoken of as their natural end, very few have been the cases of destruction by fire when spectators were in the house. Indeed, it is abundantly clear that at one time such a contingency was looked upon by builders and architects as too remote to be worth taking into account; and unfortunately their views, which were necessarily interested, seem to have been shared by those in authority, whose only interest in the matter was interest in the safety of the public. The Lord Chamberlain possesses over metropolitan playhouses an anomalous jurisdiction more despotic than anything else known to the English law. Until a recent date it rested with him only to decide whether proper precautions against fire were habitually taken in theatres, and to decide whether a new theatre should be opened or not; he could make any requisitions he thought fit, and from his absolute decision there was no appeal. How successive Lord Chamberlains and their officials have used the wide powers given to them on behalf of the public is well known. For long the inspection by the Lord Chamberlain's subordinates must have been a farce at which theatrical people laughed without more than a theatrical aside. Mr. Ponsonby Fane, when giving evidence on the subject, stated with refreshing candour that the Lord Chamberlain did not feel it his duty to interfere when theatres were "safe under ordinary circumstances," and added that the Court potentate had no power "to enforce the requirements" which he thought necessary, "except by taking the extreme step of refusing a licence," and that in no instance had this been done. In other words, the Lord Chamberlain had real power in his hands, but would not use it. There was, indeed, some sort of annual inspection of theatres; and, when a new theatre was to be built, the plans had to be submitted

to the Lord Chamberlain; but it was clear from Mr. Fane's evidence that the supervision exercised was little more than nominal. The officials seem practically to have accepted the views of theatrical architects as to what was needed. Such profound carelessness on the part of those who had ample jurisdiction can only be accounted for on the supposition that the chance of a serious fire in a theatre at a time when an audience was in it was thought too remote to be worth considering.

That this should have been, and should still be, the view of managers is natural enough. As a well-known actor said when addressing some malcontents, the management of a theatre is a matter of business. The man who constructs and opens a playhouse naturally wishes not to expend more than is necessary, and to furnish a house with a sufficient number of exits may be a very expensive matter. There are few people whose views are not to some extent warped by their interests; and, without in any way specially blaming managers, it is easy to understand how they have persuaded themselves that their theatres are safe, or that the chance of an audience being burnt and suffocated is infinitesimal, and scarcely worth more thought than the chance of an earthquake; but it does seem truly surprising that these opinions should have been accepted—up to a very recent date, at all events—by the officials whose duty it was to see that there was due regard for the safety of the public. It is one thing to regard an accident as highly improbable, another to regard it as practically impossible, and unhappily the latter view was willingly taken by the officials who wisely permitted the construction of the Opera Comique and the Criterion. Now this view is shown to be contrary to fact, and to fact of a very hideous and terrible kind. Managers will, no doubt, continue to maintain that their playhouses are perfectly safe, and that any dread about them is due to unreasoning fear. Their opinions and statements, however, are really not worth serious attention, or at best are worth about as much attention as those of the railway officials who maintain that all possible precautions are taken on their lines. It may be said with perfect truth that the burning and suffocation of an audience are very improbable; but it can no longer be said that this horrible catastrophe is so beyond the range of ordinary probability as to be ranked with things all but impossible, not to be taken into account except by panic-mongers. Within the course of a few years theatres have been burnt while occupied by spectators, and in every case there has been loss of life in the most hideous manner conceivable. The Brooklyn Theatre was burnt in 1876, and three hundred lives were lost. The Nice Opera House was burnt down in March of the present year, with the loss of at least a hundred lives. Now has come the crowning catastrophe at Vienna, and eight hundred people have perished—some burnt, some suffocated, some squeezed to death. Can any valid reason be given for assuming that what has happened in these three cities may not happen in London? Of course it may be alleged that theatres here are better constructed and better managed than theatres in America, in Austria, or in France. People who can seriously listen to such a statement are fit auditors for those who can gravely advance it. Five years ago it might have been said that the burning of a theatre with spectators in it was impossible in America, ten months ago that it was impossible in France, and twelve days ago that it was impossible in Austria. There is literally no reason whatever for assuming that such a disaster may not occur in London, and there is, unfortunately, only too much reason to suppose that at some houses very few of the audience would escape if a fire broke out. With the arguments against the possibility of such an occurrence people are by this time probably familiar. Every manager is always ready to prove that his theatre is perfectly safe, and to explain that in the event of fire every one will be able to get away easily. We have shown before now how much trust can be reposed on those assertions, and it is to be observed that even after the destruction of the King Theatre similar statements have been made respecting that edifice. It has been explained that the theatre was really perfectly safe, and that the loss of life was due to bad arrangements. Possibly bad arrangements may have contributed to the catastrophe, and the police may also be to blame; but there can scarcely be much doubt when eight hundred lives have been sacrificed that the exits were defective, and it is well worth notice that now, when the possibility of a holocaust to carelessness and cupidity has been made only too terribly clear, the reassuring assertions with which we are familiar are complacently repeated. People who are mourning over the loss of fathers, mothers, sons, and daughters are told that their relatives would never have been turned into cinders or crushed to death if it had not been for unfortunate negligence which on that particular evening made a well-planned theatre somewhat unsafe.

Even the Lord Chamberlain's officials would hardly give credence to this statement, though unfortunately it can scarcely be doubted that they have given heed to statements which were hardly worthy of more attention. To put themselves to as little trouble as possible, to let things take their chance, to place reliance on comforting assurances, not to bother themselves about what after all was not very likely—these seem to have been their guiding principles; and now the horrible catastrophe which has thrilled all Europe shows what may be the result of the manner in which they did their work, or rather of the manner in which they left it undone. In one respect, no doubt, they are not so open to censure as they appear to be. It would scarcely be fair to hold the Lord Chamberlain's office responsible for the old theatres, as his powers were perhaps not fully defined until the Act of the 6 & 7 Vict. was

passed. It is, however, unfortunately the fact that some of the houses which have the worst means of egress have been built in recent times. Three years ago the Metropolitan Board of Works took some of the responsibility off the hands of the Lord Chamberlain's subordinates; but the Lord Chamberlain of the day did not altogether welcome the change, and the result of a very absurd remonstrance which he made was that he was allowed to retain part of the power which he had used so ill. The Board of Works has not hitherto been willing to exercise all the vaguely defined powers given to it, and what may be the limits of the respective jurisdictions of the Lord Chamberlain's office and the Board it is not very easy to say; but it is clear that the former still rules to some extent. A circular respecting the gas supply has been issued by the Lord Chamberlain, and to it managers will probably pay as much or as little attention as they please. It is greatly to be hoped, however, that this feeble effort will not be considered sufficient, and that the subject will not be allowed to drop as it has been allowed to drop before.

That a fire may occur when a house is full or partly full cannot, as we have said, be doubted now, nor can it be urged any longer that the chance of this happening is too small to be worth considering. The fire at Brooklyn or that at Nice, or even that at Vienna, may be explained away; but all three cannot be explained away. It is childish to place exaggerated confidence on what is really due in great part to good luck, and to believe, because we have been hitherto fortunate, that a happy spell will for ever protect London theatres from the misfortunes which have befallen theatres in other countries. Owing to the carelessness which was common in former days, and to gross neglect of duty recently by a public department, there are many theatres which are not altogether safe, and some which are extremely unsafe. Whether improvements can be made in these latter, or in all, and at whose cost they should be made, should be settled; for now that the possibility of hideous disaster has been made manifest these questions should assuredly receive more serious attention than has yet been given to them.

#### RADICALISM AND FREEDOM.

IT is perhaps difficult for outsiders to share in the enthusiasm of the *Times* over the style of its latest irregular correspondent, Mr. Auberon Herbert. "He writes so well," that even the *Times*, as it confesses, can hardly resist the charm of his writing. It is an ancient and invaluable maxim that, as is the praiser, so is the praise. The language in which the *Times* indulges in its ecstasy of rapture over Mr. Auberon Herbert is not calculated to inspire implicit confidence in its eulogies on points of style. "The measure is still in the clouds and the weapon is still brandished. It is not easy to criticize what we are told is in a stage of incubation." A measure in the clouds, a measure which coming down from the clouds becomes first a weapon and then an egg, is a phenomenon of an unusual character. "Je fais des métaphores qui se suivent," said one of the greatest of French writers as a vindication of his claims, but it is not easy to discern the principle of sequence in the cloud-measure, the weapon, and the egg. The writer in the *Times*, however, besides giving ingenuous measure (not cloud-measure at all) of his faculties of style, is good enough to oblige his readers with other information. He spends, it would seem, "half his days in the country, the real working country of Old England," and "no man can do this without feeling every year deeper and deeper in his heart the wish that our farmers could be made something better than they are now." It is a touching picture, the picture of a great writer, a man who can deal you out consecutive talk about cloud-measures, weapons, and eggs, who passes half his days in the real working country of Old England, as opposed, it is to be presumed, to the idle region of the *pays de Cocagne*, and who feels wishes of the purest benevolence sinking deeper and deeper in his heart for every hundred and eighty-two and a half days thus spent. A little further on we read that the distinguishing feature, or at least "an attractive feature, of country life is its hereditary character." Clearly, therefore, this haunter of the country is not a man of yesterday. The result of his ancestral connexion with the soil is the assertion that "farmers were more men of letters, more men of culture and men of manners hundreds of years ago than they are now." The columns of the *Times*—at least its leader columns—are not places in which one looks for startling discoveries. But this sentence certainly shows that the country resident in question has some remarkable unpublished memoirs handed down from those ancestors who have given him his hereditary character. These memoirs really should be published.

It is rather hard on Mr. Auberon Herbert that he should be introduced in this way. "It is a measure in the clouds; I see it brandished; it is in process of incubation," might pass for an irreverent joke if jokes were admitted in the place where it appears. But Mr. Herbert's letter, though perhaps not displaying the remarkable style which the *Times* discovers in it, is a sufficiently lively performance. Indeed, these modern "hootings of an owl in the wilderness," to borrow a title from David Deans, are very instructive, and even amusing, reading. They make Mr. James Howard (and, if we remember rightly, Admiral Maxse) dreadfully angry; but they are wisely passed in silence by the rest of the Radical party and by sober Liberals who understand the advantage of not answering what you cannot answer. The

answer, in fact, is much simpler than any mere pen-and-ink rejoinder. An idle bystander, contemplating politics with impartial eye and a tolerable memory in the brain behind it, must smile to see how the positions of parties have been reversed. Sixty years ago a keen satirist like Peacock could find nothing better to put into the mouths of his Tories than a choral response "The Church is in danger! the Church is in danger!" to all troublesome arguments. The watchword has survived, but the terms have been altered. "Mr. Gladstone's Government is in danger" is the sufficient and simple reply to such undisciplined maunderings as those of Mr. Auberon Herbert from his hermitage in the New Forest. It is not that Mr. Herbert has not laid his flank open to the archers with sufficient generosity. A man should not gibe at his enemy for not using the English language in the same sense that he does, and, in the same composition, employ the word "loan" as a verb. In point of humour Mr. Herbert appears to be fairly on a level with his distinguished enologist of the three metaphors. "We may still," says he, "have some amusement by the sight of ambulatory assessors let loose in this country and flying over the fences by moonlight." It would be great fun, certainly; but some acquaintance with the Bill of the Farmers' Alliance, and a profound dislike for it, have yet not enabled us to discern the probability of this particular form of sport if Mr. Hunter's proposals were accepted. Lastly, Mr. Herbert undertakes to vindicate his own existence as a Radical Republican. Mr. Howard had bewailed the decease of that entity—or, at least, its severance from Mr. Auberon Herbert's personality. "He is still here," says Mr. Herbert, cheerfully, "though it may be that he better understands his own creed than before, and holds it with more consistency." The proof of this improvement in Mr. Auberon Herbert's intellectual fibre is that his argument for landlords "rests on the same foundation" as that for the disestablishment of Churches, the abolition of religious disqualifications, and that "by which hereditary institutions will in their due season be abandoned." We are not concerned now with hereditary institutions, or else it would be not very difficult to show that Mr. Herbert is still a halter between two opinions, and that in the excellent frame of mind in which he now is he will probably come round even to a House of Lords in which younger sons have no seats before long. It is sufficient to say that he is still evidently sound in the Radical faith, perhaps even in that yet more absurd faith which calls itself Republican, and which bases the right of a fool to demand obedience from a wise man on the fact that it is frequently easy for the fool to find a majority of his likes. However, this orthodoxy makes his final statement really interesting. "Every man, rich and poor," may, it seems, make of the Radical Republican principle "one claim, that he should be accounted a free man, free in the disposal of his faculties and his possessions"—always excluding, of course, hereditary rights and dignities which do not descend to younger sons.

When Mr. Auberon Herbert next takes up his pen to witch the *Times* by noble penmanship, this last sentence of his will give him an excellent starting-point, and, if he will take our advice, he will send for many histories and Blue-books, and set about an inquiry into the conduct of his friends the Radical Republican party of all times, nations, and countries in reference to this particular claim. We have not the remotest wish to prejudice Mr. Herbert in this laudable search, but from some experience in it we shall make so bold as to say that he will find it the exact claim which Radical Republicans absolutely refuse to admit. The Radical Republican of France ninety years ago informed people briefly that if they disposed of their faculties or possessions by taking them across the frontier, confiscation of such of the latter as they could not take, and prompt extinction of the former by the guillotine, in case of capture, would be their portion. The Radical Republican of two centuries and a half ago in England informed his countrymen that if they had the impudence to worship after the manner of their fathers (which may be said to be a pardonable employment of faculties), or if they furnished assistance to their only lawful sovereign (which may be taken to be a conceivably free employment of possessions), various penalties from prison to scaffold would be theirs. The Radical Republican of to-day in the United States goes to work less decidedly; but his general tenor of conduct is much the same, though the constraint exercised is social rather than legal. The Radical Republican of France now is a much more thoroughgoing specimen of the class. There you may not dispose of your property as seems good to you; you may not express your political opinions; you may not join yourself to other persons to employ their and your faculties and possessions in the service of God without the chance of being expropriated and driven out of the country. In England itself the inquiry will be particularly fruitful. Under the wicked old régime before the Reform Bill, the nominal restrictions of law were accompanied by the utmost personal freedom. Unless our great-grandfathers and grandfathers stole, or murdered, or smuggled, or poached, or ran away from a presgang, they had every chance of passing their lives without any interference whatever on the part of the Legislature. They had to pay their taxes certainly; but this done, they disposed of their faculties and possessions as they would. A most remarkable change has come upon us in consequence of the operation of this same Radicalism, which is not always frank enough to call itself, as it does in Mr. Herbert's case, Radical Republicanism. The things that we may not do have multiplied with the most portentous rapidity. We may not be thirsty after or before certain hours; and in Wales we may not be thirsty at all for one day out of the seven after next August. Being

members of the National Church, we may not give churchyards to that Church, but must give them at the same time, unless we choose to take cunning legal precautions, to Jumpers and Ranters. We may not let our lands, if we have any, on the terms that we and our tenants choose to arrange as to game. If we are unlucky enough to possess any in Ireland, we may not let them as we choose at all; but must be content with taking thirty or forty per cent. off the rent which the first comer would gladly pay for the benefit of any idle and defaulting loafer who happens to be in possession. The darling object of the Radical (we still must not call him a Republican) just at present is to add a few more disabilities of the same kind. He pants for the day when we may not canvass electors to return us to Parliament, the pure, wise, and beneficent agency of the caucus being duly substituted. He longs for a time when a wicked Tory minority may be prevented from employing their faculties in opposition to the great and good designs of the greatest and best of statesmen in virtue of cunning *clôtures* and other gags and muzzles of the same kind. Indeed it is not easy to find, in looking through the Radical programme, any single enabling clause. Not only may we not have a churchyard, but shortly we are not to be allowed to have a Church; we must take our chance among a row of competing Bethels. We may not secure our posterity from the folly or imprudence of youth by settlement; and we may not be sure that what we leave for a certain object tending, as we think, to the public welfare will not be perverted to what the donors would assuredly think the public hurt. Some of these contributions towards the liberty of disposing of faculties and possessions Mr. Herbert expressly approves, others he does not seem to like. Let him draw out the list completely—we have given but a mere sketch of it—and study it; and, if he likes, publish it for others' study. He will find that the most fantastic despotisms in the world have hardly exceeded in despotism the interferences with the free use of faculties and possessions made by Radical Republicans in the past, and have hardly approached the rigour of interference of this kind which is threatened by Radical Republicans in the future.

#### CLEEVE ABBEY.

THERE is hardly a more disappointing writer on English antiquities than the indispensable John Leland. He is usually our sole authority for the structural character of the religious houses just at the time of their dissolution; yet, though he styles himself the King's Antiquary, and as such was sent through the country to search into the literary treasures of the monasteries, the information he affords of the places wherein these were contained is frequently little more than that one building stands so many miles apart from another. An instance in point is St. Mary's, Old Cleeve, the only Cistercian Abbey in Somerset, which he did not turn aside to inspect, though he says that he passed within a quarter of a mile of its walls. Had his curiosity induced him to glance within the portal, he would have discovered one of the completest arrangements of monastic buildings of its kind in the kingdom, though not one of the most extensive. The library, however, which perhaps had hardly at any time reputation enough to draw a bibliographical traveller out of the highway, was already ransacked; and Leland knew too many abbeys and priories to be careful of viewing one or two more for the sake of their architectural distinctiveness. Happily, in the case of Cleeve, there is smaller need than usual of his description; for, except the church, the buildings are in general almost as perfect as he himself would have found them. We may yet see the gatehouse, sacristy, chapter-house, day-room, dormitory, refectory, and many other offices in as fairly complete and picturesque assemblage as when the monks cast their last longing, lingering look behind on going forth into the world. Until lately, however, the spot was rarely visited except by some zealous antiquary or ecclesiologist, for the cloister garth had been converted into a farmyard, and the surrounding apartments into granaries, pigstyes, stables, and sheep-cotes, the lowing of oxen and the cock's shrill clarion replacing the chants of the cowed brethren. This was the condition of the place when we formerly saw it, but all is now changed for the better. The farmer with his stock has been provided with more befitting accommodation; the cloister court, relieved from an indescribable scene of lumber and refuse, is now covered with soft green turf; and the monastic offices have been cleansed; while a systematized exploration of all parts has helped to make clear the meaning of the whole. The visitor to Blue Anchor, Minehead, and Watchet, each of which seaside retreats is within a few miles of the ruins, finds practically a fresh showplace of remarkable interest introduced to his view, and it may be said that some of the importance of these holiday resorts is owing to their neighbourhood to Old Cleeve. The pleasanter state of things at the Abbey is in consequence of the estate having been purchased by Mr. G. F. Luttrell, of Dunster Castle, in the neighbourhood, who in 1875 began the good work of rescuing the buildings from their degraded condition. Under the instructions of the late Precentor Walcot, a gang of labourers carted away the accumulations of soil, and gradually brought to light by their pick-axes the lost sight of the Norman minster, including numerous encaustic tiles and other relics; the result being to offer to the student of monastic architecture a profitable illustration of Cistercian arrangement, and one that even Mr. Sharpe seems to have left unnoticed. But, before touching further upon the remains, it

may be useful to give some particulars of the origin of the monastery.

The foundation charter of St. Mary's, Cleve, is assumed to be lost. It was formerly in the possession of Sir Hugh Windham, one of the judges of the Common Pleas in 1677, and is fortunately printed in Dugdale. It asserts in the usual form that William de Romarā granted all his lands at Clyve, with its liberties and customs, military service alone excepted, to found there an abbey by the hand of Hugh, Abbot of St. Laurence of Revesby. The pedigree of the family of Romarā is declared by Mr. Planché to be one of the most puzzling in the whole catalogue of Norman nobility, and he confesses that forty years' study had not enabled him to penetrate its mysteries. We therefore humbly leave these mysteries as dark as we find them. It may suffice here to explain that William de Romarā, who became Earl of Lincoln in 1141, received by inheritance the manor of Cleve, which had passed to his ancestors from Earl Harold at the Conquest. His grandson, of the same name, was founder of the abbey at that place, the first of these De Romarās having left an example for his descendants by building the Abbey of Revesby in Yorkshire. From that Cistercian house Cleve was colonized, and the founder of the latter seems to have had so much affection for Revesby as not only to appoint its abbot to execute his deed of piety at the former, but to prefer the parent monastery for his place of burial, the inscription on his tomb being simply "Fundator Monasterii B.M. de Clyve." A second charter recites more fully the intention of the house at Cleve, which was to be for Cistercian monks, and for the health of the soul of "my liege Richard (I.), King of England, and for the soul of Henry his father, my lord who brought me up, and of all my ancestors and heirs, and for my own soul and of Philippa my wife," &c. Among the witnesses were Lord Hugh de Grenoble, Bishop of Lincoln, and the Lord Abbot of Rievaulx. The famous Hugh de Burgh, Earl of Kent and Chancellor of England, who was father-in-law of the founder of the abbey, was one of the benefactors; and Richard, Earl of Cornwall, brother of King Henry III., granted the fraternity lands in Cornwall, including Treglastan, to hold peacefully with infangethes and utlangethes—i.e. with the power of punishing a thief dwelling either within or without their liberty, if taken within their fee; and to be quit of the citements of the sheriff's turn or king's leet, and all other secular exactions. By a later grant, inferred by the Rev. Thomas Hugo to be of the date of Richard II. or Henry IV., Robert, son of Hugh de Wude, affords the right of common pasture of all his land of Wude, saving his corn and meadow land, from the calends of April to the time it is reaped and stacked, for 300 sheep and for 60 beasts and for 60 swine, on condition that at his decease the monks shall do service for him as one of themselves, and receive, should he finally desire it, his body for burial. This gives some idea of their large flocks and herds, for the Templars were not more warrior monks than the Cistercians were a farming community, and the scythe in the one case outlasted the sword in the other—a symbol, it may be hoped, of the final condition of things. For the sale of their produce they were, A.D. 1455, allowed to hold a market every Wednesday, and a fair, to last three days, twice yearly at the feasts of St. James the Apostle and of the Exaltation of the Holy Cross. These manorial privileges had been granted to provide funds for rebuilding the beautiful little chapel of St. Mary, which stood away on the seashore, and had been overwhelmed by the fall of a cliff, only the image of the glorious Virgin and the altar of the same chapel remaining uninjured, being miraculously preserved, as was believed. The market was held in the outer court of the convent, and we may yet see the octagonal basement of the stone cross which once uplifted its head among the buyers and sellers, but a grand old sycamore occupies the place of the shaft.

Evidence of the high rank of Cleve among the English houses is afforded by the letters of Richard III. to the heads of their order and to the mayors, sheriffs, and constables of the realm, by which these spiritual and secular authorities are commanded to assist and obey at all times the abbots of Stratford, Woburn, and Cleve, who had been appointed by the holy father in God the abbot of the head house of Cîteaux, and by the General Chapter of the Cistercians to visit reform, punish, and correct all manner of trespassers, malefactors, apostates, rebels, and rufagates, who had sheltered themselves under their vows, and all other evil conventual livers. Such visitations, though sometimes serious in their effect, must, together with the markets and fairs, have helped to relieve the monotony of the devotional discipline. There was also sometimes a little excitement on the arrival of a messenger from some distant monastery bearing with him intelligence of the lamented death of the father abbot of his house, and possibly a little news or gossip of what was happening in the world through which he had passed. His obituary-roll would be inscribed with the names of the convents he had already called upon, whose inmates had engaged to "batter the gates of Heaven with storms of prayer" until the soul of the departed brother was added to the saints; and his mission to Cleve would be to request the like kind offices from the brethren there. On one occasion he brought a petition for suffrages on behalf of Walter Skirlaw, successively Bishop of Coventry and Lichfield, Bath and Wells and Durham, who died in 1406; and on another for William Echebster and John Durnby, Priors of Durham, who died respectively in 1456 and 1468. Politics were not altogether abjured within the cloistral walls, but they sometimes proved a costly luxury. In a Commission taken before the Dean of St. Paul's, London, in 1498, the abbot of Cleve, in company with his brothers of Ford and Muchelney, was declared among

the traitors of the West who had supported Perkin Warbeck. Fortunately he lived before Judge Jeffreys made his gory assizes in the same district, and so he might feel happy to escape with a fine of 40*l*.

The most stirring visitor was one who appeared at the convent gate in 1536, to tell the abbot that his house was to be desolated and his altar abolished. Though the alarmed William Dovell agreed with the enemy quickly, and accepted his retiring pension of 26*l*. 13*s*. 4*d*., it might have cost him a few pangs to quit his cloistral home, for he had added much to its architectural character, the great gatehouse and splendid refectory being his work. But all the fair structure of the Abbey, except such buildings as the King had ordered to be felled, together with 632 acres of arable and meadow land, was granted away (February 29, 1537) to Anthony Bustard, gentleman, at the cheap rental of 42*l*. 2*s*. 8*d*. He did not, however, long hold the estate, for the reversion was granted on March 20, 1541, to Robert Earl of Sussex, at the yearly rent of 33*l*. 14*s*. 8*d*., the actual value being more than three times as much. But in the distribution of the monastic houses and lands the supporters of Henry had, like the followers of the Conqueror, no reason to complain of ingratitude from their royal master, the grants being in some instances almost equal in value, if not in territorial extent, to the Saxon lordships assigned to the Norman chiefs. Besides receiving the monastery of Cleve with its green pastures and easy tenure, Lord Sussex was enriched with the grant of Attleburgh College and Chantry in Norfolk. His title was found in his "good, true, faithful, and acceptable" services in the Northern rebellion, called the Pilgrimage of Grace, in connexion with which the unfortunate abbots of Fountains and Jervaulx saw no relenting in his face as their judge, being ignominiously hanged at Tyburn. He enjoyed the monastic spoil but a short while, for he died the year after the demesne of Cleve came into his hands. The same terms of tenure were granted by Elizabeth to Thomas, Earl of Sussex, the succession of owners, since his period, showing none more careful of the interest of the fine remains of the Abbey than the present possessor.

The situation of Cleve, which is so named from the cleveo, or cleft, on the north side of the valley whence the stones were quarried, is not so striking as that of Tintern or Valle Crucis, among their stately green hills; but the poetical title of the Vale of Flowers, which was given to the spot in one of the charters of the Abbey in the days of Henry III., is no undue compliment to the luxuriant meadows, sheltered by a wooded height on the north, and by the undulating line of the Brendon Hills on the south in the distance. A bridge of two low arches, over a rapid stream which flows down the valley, leads from the public road at once into the abbey grounds, which were defended by walls and a moat—a not unnecessary precaution in earlier days, whether for cloister or castle. The moat may still be seen, and the walls also, though in a fragmentary state. Within this outer boundary were a mill and two fishponds, together with the granges and other offices needful for home farming. A tall gatehouse is the first conspicuous architectural object within the enclosure, which, unlike the frowning baronial portcullis to forbid ingress, had a gate in the middle, so that a visitor might at once receive the shelter of a portico before admission to a larger hospitality. The lower stage is of the thirteenth century, but flanked by buttresses of a later period, probably added by Dovell, the last abbot, whose name appears on a tablet over the archway of the inner side as being the builder of the upper story. His hospitable disposition is denoted by an inscription on the exterior, which seems in mockery still to invite the hungry wayfarer to a generous board. But the last table was spread more than three centuries ago, and

Porta patens esto  
Nulli claudaris honesto

will beguile no traveller, either honest or dishonest. A passage 46 ft. long by 13 in breadth had formerly a groined vault, which, having fallen in, reveals above it an open timber roof that once covered the hospitium or guest-house, a spacious apartment lighted at each end by a square-headed window of three lights. On entering the quadrangle a hasty interpreter might pronounce the architectural plan to be clearly Benedictine, the immediate evidence being the position of the refectory, which runs parallel with the axis of the church, instead of at right angles, as usual with the Cistercian type of construction. The later date of this building, compared with the adjacent domestic offices of the monastery, leads to the suspicion, however, that there may have been some interference with the original arrangement; and this on examination is found to be the case.

Leaving this point for the present, we consider the scanty remains of the church, which, it may be assumed, was one of the buildings that our religious King Hal ordered to be levelled. This in itself has furnished so fair a quarry for village purposes that it has seemed unnecessary to disturb the other parts. The walls at the east end where the minster was begun to be erected were 6 ft. 4 in. in thickness, those of the nave being 4 ft., and the whole length 161 ft. The remains are pitifully scanty, but there are some portions of walls, with traces of procession doors and windows, together with some broken bases of columns. These columns, instead of being clustered like Tintern, which date a few years later in the second half of the thirteenth century, were of a bold, round section, after the transitional Norman type of Buildwas and Fountains. The plan was in keeping with the leading abbeys of the order in England, having a short, square-ended presbytery, and square transepts with eastern chapels. The monks' choir, as usual in Norman minsters,

was beneath the low central tower, and advanced one bay into the nave, where it was terminated by a rood screen, the remainder of the nave being for the superannuated and infirm, who worshipped in the retro-choir west of the screen, and the lay brethren or *converses* who held the space between that occupied by the infirm and the western door. Though the rule forbade ornament, the squares of encaustic pavement, with armorial and grotesque devices, which have been dug up in great number, show that the love of ecclesiastical finery was stronger than the spirit of obedience to the dead letter. The eastern side of the cloister, which with the south is more perfect than the western alley (the wall of the church forming the north side), is entirely Early English, and from its severe style may be assigned to the earlier part of the thirteenth century. Adjoining the south transept of the church on this side, we find the sacristy, which has a remarkable circular window seven feet in diameter, once filled with fourteenth-century tracery, possibly of wood. Then succeeds a chamber that occupies the normal position of the armarium or smaller book-room, but which Mr. Sharpe, in his general plan of Cistercian buildings, calls the penitential cell; and certainly its single, high, narrow, lancet aperture gives it more the appearance of a prison than a library. The Chapter-house, with its fine Early English vaulting, follows next, and is entered by an archway rather than a doorway, for it was open to the cloister, and the double unglazed lancet, with its quatrefoil head on each side, is unglazed—such were the stringent rules and hardy habits of the Cistercians. Annexed to the Chapter-house on the south is the conventual parlour, and then comes a spacious chamber 60 ft. in length and 22 in breadth, which was the calefactory, the fireplace that gave its comfortable name being still evident. This apartment has been sometimes erroneously called the Fraternity, a name that belongs to the refectory, as shown in a former article (*Saturday Review*, February 26, 1881) on the Fraternity at Carlisle. Here the ordinary business of the abbey was transacted, a fire being necessary for other purposes besides warming cold fingers, whether for heating charcoal for the thurible, preparing parchment and vellum for the psalters and legends, or even for less ecclesiastical purposes. The dormitory was a yet more spacious apartment, and extended over and formed the upper story of the building we have been speaking of. This chamber, now divided by a modern wall, was of the extraordinary length, considering the fewness of the monks (twenty-eight in the thirteenth century and seventeen at the Dissolution), of 137 ft. by 24, and is lighted on each side by a series of lancets, each deeply bayed for a seat, but without traces of glazing, having, no doubt, been supplied with wooden shutters. Till 2 A.M. the monks slept on their palliasses against the piers between the windows, when after seven hours' rest the bell sounded for them to descend the night-stairs into the transept of the church. That a bedroom fire was not altogether a secular luxury may be argued from the fact of there being here a large fireplace, near to which is the muniment room or library; this extended over the eastern bay of the Chapter-house. At right angles with the dormitory, and making the south side of the quadrangle, is a range of buildings, of which the lower story is Early English and the upper two centuries more advanced. "*Bonus Bernardus non videt omnia*" was so convenient a maxim that in the relaxed days of the rule much liberty was taken with it. Here, as we have said, the refectory is in an abnormal position, and, instead of being in keeping with the severe style of the dormitory, with its simple lancets, is a stately apartment, worthy to have been the hall of a baron's castle or of a rich and powerful guild rather than of a few self-renunciating monks. It measures 51 ft. by 22, and, though but an upper room, is lofty in proportion. On either side is a range of windows, having tracery of the early part of the sixteenth century—the date of the hall itself. The carved angels which start from the hammer-beams of the magnificent oak roof spread their feathery wings with so buoyant a grace that they seem almost to beat the air in actual flight. The ascent to the reader's pulpit, and a fireplace, are on one side, and there is a large painting in distemper of the Crucifixion at the east end. At the west end is a door leading to the abbot's lodgings, of which the upper chamber is covered with a fine oak roof and the lower is adorned with curious wall-paintings, the whole of this part being worthy of more attention than we can here afford.

Not the least interesting portion of the undercroft is the doorway to the steps of the present refectory, which had formerly served for the entrance to the original one. This ran north and south, according to the rule, and was situated on the ground level. The interesting discovery in the convent garden of the foundation walls and heraldic pavement of the earlier apartment was due to Mr. John Reynolds, who has detailed his researches in the "*Proceedings of the British Archaeological Association*" for 1877, an elaborate description of the armorial tiles by Colonel J. R. Bramble being in the same volume. The western alley of the cloisters was appropriated to the use of the converts or lay brothers, and we may yet see at the south end of the floorless dormitory overhead the doorway to the night-stairs by which they descended to the nave of the church, whose nocturnal services they were bound to attend. This side of the quadrangle has been partly enclosed with Perpendicular stone tracery, which is connected with chambers of the same date, now occupied by the warden of the ruins. The foundations of the original converts' house, extending, as at Fontaines, to the west front of the church, with which this part was united by a circular staircase turret, may yet be traced.

## BOUCHARDY AND EDMUND KEAN.

SOME curious volumes of a magazine called *Le Monde Dramatique*, which was published in Paris, with a frontispiece by Célestin Nanteuil, in 1835, and of which we have said something on a former occasion, contain, amongst other odd matter, a story or sketch, in two numbers, from the pen of the prolific M. Bouchardy, which he called "Two Episodes in the Life of a Great Actor." The first episode is, in some ways, the more remarkable of the two. It introduces us to a tavern in the suburbs of Manchester, where three men, a young woman, and some children were sitting at supper. From the odd appearance, says M. Bouchardy, of these people, from the mixed nature of their language and their costume, and from the shrunken dimensions of their baggage, it was easy to see that they were comedians, not comedians of the successful and kid-gloved kind, "*mais de ceux dont la vie n'est qu'une longue comédie, et que l'on nomme en France baladins et en Angleterre strolling players.*" Then we have a not very original description of the life of "strolling players"; and a statement that those particular "strolling players" were accustomed on fine evenings to play at five, and to have supper at ten, and on wet evenings to have supper at ten and begin the performance at eleven. On this occasion it had been wet; it was past ten, and the time drew near for beginning. "Old Jack Bob," who was three gentlemen in one—manager, stage manager, and acting manager—had turned his collar above his ears, pulled his hat low down on his forehead, and was walking round and round the table in a depressed way which was not usual with him. "Par Dieu, Master Bob," cried Tom Cove, the clown, "you look as if you were going to a funeral." "Come, Bob," cried Jackson, the bass, "we are never certain of a breakfast; at least make sure of your supper." Jack Bob, however, replied that he was neither hungry nor thirsty, went on to make some sentimental remarks upon the best way of keeping the landlord in good humour, and wound up by observing that to-morrow they might be worse off than to-night. "Do you not see that one of our company is missing—and that one—" "David! David!" exclaimed Betty the young, Betty the fair, Betty the graceful, who had just given a cuff to one of the children. "Oui, David, reprit Jack Bob, lui, qui nous avait promis de ne rester que quelques heures chez le duc de Bedford, et qui n'a pas reparu depuis deux jours entiers." Jack Bob went on to ask who was to play harlequin and Shylock if David did not return, who was to sing *Rule Britannia* with spirit and energy enough to make the audience join in the chorus, who, in fine, but David was the soul of the company? Tom Cove suggested that perhaps David would return in time; but Jack Bob scouted the suggestion, and announced his conviction that David was tired of his present life, that he had entered the service of the Duc de Bedford, and that he was an ingrate. "Master Bob," said Tom Cove, "you have lost your wits." Betty then burst into an eloquent defence of David, which she broke off blushing, and fearing she had said too much. The "leading juvenile" also threw himself into the discussion; and, in the middle of it all, the missing David appeared. He said that he had been through the round of his performances; that he was "*las de la vue des ducs et des comtes, fatigué de l'odeur de musc des duchesses et comtesses*"; and that he was hungry; and thereupon he ordered supper for the whole company. "*Quel festin! On y but du porter, on y but de l'ale, puis les esprits s'animent et l'on fit du grog et du punch*"; and then, after a merry evening, everybody wanted to go to bed except David, who called wildly for champagne. At this the prudent Jackson and Jack Bob became alarmed; but David exclaimed, "*Allons, Tome Cove, ces deux vieillards sont devenus stupides comme des Cassandres; demande du champagne et trinquons.*" Tom, or Tome, Cove wisely replied that he was willing enough to drink champagne, but didn't see where the money to pay for it was to come from; and, finally, David flourished a five-pound note. "*Qu'on m'apporte pour cinq guinées de champagne; puis il se mit à chanter de toute la force de ses poulmons.*"

The sight of the bank-note filled his companions with astonishment and terror, and Jack Bob set the example, which they all followed, of silently going out of the room, leaving David to finish the bottle alone and to go to sleep under the table. In the morning he was awakened by Jack Bob, who said to him in mournful tones:—"Get up. Here is your harlequin's dress. Take it, make your way across the woods, and may Heaven forgive and help you. As for you, you are young, active, and clever. You will always be able to make a living so long as you keep beyond the reach of the arm of the law. But as for us, what shall we do without you?" "Ah! malheureux! dit Bob d'une voix chevrotante, j'ai perdu onze enfants sans les pleurer et je te pleure aujourd'hui; puis il essuya ses yeux avec sa manche et sortit en murmurant quelques mots que David ne put saisir." Presently "Betty la blonde" came in ready dressed for a journey, and explained that, as it was decided that David must leave the troop, she was determined to go with him. On his asking what was the meaning of all this, she explained that the others had come to the conclusion that they must part company with him, as they had no wish to be hanged with him. "Et pourquoi serai-je pendu?" dit David en riant aux éclats. Pour vol, à ce qu'il dit Jack Bob." On learning that they were convinced he had stolen the bank-note of the night before, David did what was, of course, the proper thing to do in the circumstances—that is, he bit his lips, knitted his brows, and strode up and down

the room in the greatest agitation. Then he went indignantly to his companions, seized the unhappy Jack Bob by the collar, and crying, "Tu vas venir avec moi sur l'heure," dragged him to the street door. At this point the innkeeper intervened, clamouring for payment, and, unable to stop David, girded up his loins, and ran as fast as he could close at the actor's heels. In this way the three arrived at the house of the Duc de Bedford, when, despite the impertinence and opposition of the valets, David, followed by his two companions, made his way across the splendid rooms to the bedside of the Duke, where he exclaimed, "Pardon, mylord, si j'interromps votre sommeil, mais quand il s'agit de son honneur un pauvre diable a le droit de frapper à toute heure à la porte d'un duc." The Duke, "un peu surpris," as well he might be, sat up to listen to David's story, and then, "curieux de compliquer l'aventure," said that he had never given him a five-pound note. "Vous mentez," cried David, and handed him the note, which the Duke looked at attentively, and then, explaining that he must have given it to him in mistake for a ten-pound note, produced a ten-pound note, which he handed to David with a request to be left in peace. The money thus happily got was immediately spent, and next evening the "strolling players" were as badly off as before. "Et vingt ans plus tard David avait changé son habit d'arlequin contre ceux d'Othello, d'Hamlet, de Macbeth, et de Richard III., et avait ajouté au nom de David ceux d'Edmund Kean."

This is the first of the two episodes, which is perhaps strange enough in its way, but hardly so strange as Bouchardy's assertion, in the second episode, that he had the story of "la banquette du duc de Bedford," of Jack Bob, of Tom Cove, and of Betty the fair, from Kean's own lips at a restaurant in Paris, when he repeated the very phrase of the first episode, "qu'on m'apporte pour cinq guinées de champagne." Then he became restive, and refused to appear on the stage at the appointed time. The occasion of his obstinacy was his seeing the Duchess de Kerry's carriage, and being told that she had come on purpose to see him act. At this he broke out with a protestation that he would never let it be supposed that he had come all the way from London to leave his pleasant after-dinner period for the sake of giving the Duchess an hour's amusement. "D'ailleurs, je ne veux pas m'exposer à la critique des oisifs de la cour; si la duchesse n'était pas venue, j'aurais joué, sans doute; mais puisqu'elle est au théâtre, je vais écrire du suite au directeur que je suis alité." Then, according to Bouchardy's recital, followed a remarkable scene. Kean told one story after another, with admirable spirit and success; and his faithful valet meanwhile sacrificed himself to his master's interests by drinking up all the wine as fast as the bottles were opened, so as to prevent Kean from drinking more than the one glass which was before him when the conversation began. At a quarter-past seven they reached the theatre, where the curtain ought to have risen at half-past seven. Kean was ready to go on the stage, but unluckily ordered and drank "un verre de grog" and at the same time caught sight again of the fatal carriage. Then he resumed his old argument against appearing on the stage to amuse the Duchess, and began to take off his half-assumed costume. It was nearly half an hour after the advertised time of performance when he was persuaded to resume his dress and play his part by the ingenious device of a friend, who drew a harrowing picture of the distress which would be inflicted on a large number of scene-shifters, carpenters, and supers, if the performance were given up at the last moment. M. Bouchardy goes on to give a curious account of what Kean did with his money. A third, he says, was absorbed by dishonest men of business and false friends, another third was given away, and another third "plutôt dissipé que dépensé." This being so, it is difficult to see where the "aisance raisonnable" which Bouchardy says he left behind him came from, and it is a little amusing, after having read the story, to read the author's concluding remarks:—"Pour moi, qui me suis approché de l'homme qui avait fait battre tant de cœurs et verser tant de larmes, de l'homme qui avait tant joué et tant souffert, qui avait eu les plus beaux triomphes et les plus grands dégoûts, la plus riche opulence et la plus froide misère, je me suis plu à l'étudier consciencieusement."

#### THE LOST BALLOON.

IT is almost impossible to think any longer with hope of the fate of Mr. Powell and of his balloon. Six days have passed since the unfortunate aeronaut started from Bath with Captain Templer and Mr. Agg Gardner. The upper air at that time was full of snow-clouds, and these it was intended to examine. The balloon at once rose to the height of 4,000 feet, passing through the stratum of snow-clouds, and sailed south-west over Wells and Glastonbury. Here a north-west current was lost, and, after various attempts to hit off the height at which a favourable current was blowing, the voyagers coasted to Symondsburry. Here they drew near enough the earth to ask their way to Bridport, and finally descended within a hundred and fifty yards of the cliff above the sea. The balloon dragged, Captain Templer fell out and slightly injured himself, and this loss of several stones of ballast caused the balloon to rise several feet, while still making steadily for the cliff and the water below. Mr. Agg Gardner now dropped out, not without a severe accident; and Captain Templer, throwing all his weight on the line, called to Mr. Powell to descend by it. But this was so perilous an enterprise, that Mr.

Powell, who was very expert in the aeronautic art, preferred to cling to the balloon and its chances. He was last seen, apparently perfectly cool, waving his hands in farewell as the balloon moved swiftly and inevitably into the growing darkness across the sea. Mr. Agg Gardner was of course prevented by the severe injury he had sustained from taking any active part in the attempt to rescue Mr. Powell; but Captain Templer behaved with the greatest energy and judgment. He had boats sent out at once from Bridport in the direction the balloon was taking, and he telegraphed to Weymouth for a steamer. But, when he arrived at Weymouth, he heard that a balloon had been seen to drop into the sea at the distance of about two miles. For various reasons Captain Templer disbelieved this report, which there is now too much reason for supposing to be correct. It appears to be probable that, either because the gas escaped, or because the balloon soared too high, so that its solitary passenger was chilled, or for some other unguessed-at reason, Mr. Powell lost command of his vehicle, and sank with it into the Channel not far from Weymouth. Captain Templer did all that could be done to secure information and to bring help to his friend. He crossed the Channel, he returned to Weymouth; and since then no possible chance of receiving information, or of sending aid, on either side of the Channel has been neglected. It is impossible, of course, to foresee or account for the vagaries of a balloon. The currents of the upper air may be moving swiftly in one direction, while the breezes below may be moving slowly in another. But there seems every reason to suppose that the balloon did not alter its south-east flight. Even if we suppose that it did not really sink into the sea at Weymouth, Mr. Powell must long ago have drifted into the water elsewhere, or have reached some point of inhabited country whence, if he was alive, he could have telegraphed. The only possible gleam of hope is to suppose either that he was picked up by an outward-bound vessel, or that he lit, in an unconscious state, and unable to make himself understood, in some very backward district, where the peasants had neither heard of his disappearance nor were able to communicate the news of the arrival of a balloon to the papers.

It is unlikely that the exact manner of Mr. Powell's disappearance will remain for ever unascertained. The sea or the land will give up some traces of the large and most ill-fated balloon in which he passed away out of men's sight, in a manner so strange and so impressive to the imagination. Fishing-boats will search the sea and the rocky coasts of the Channel. Every vessel is on the outlook, and rewards have been offered at all the ports. The "Saladin," in which Mr. Powell disappeared, seems to have been very unmanageable even for a balloon. It was the *Great Eastern* of balloons, very large, unwieldy, and unlucky. It began its career in a captive flight, by jolting Captain Elsdale up and down the roofs of the buildings near the Royal Arsenal. Next it just missed by a hair's-breadth the top of St. Paul's. Thirdly, it jerked Captain Lee on to a gasometer, and then shot up into the air with Captain Templer, who received a blow on the head, was rendered almost insensible, and very narrowly escaped being run away with. On another occasion this unwieldy balloon behaved so dangerously that Captain Elsdale had to escape by sliding down a rope, a hundred feet long, into a boat. To slide down in this way was, as we saw, Mr. Powell's last chance of escaping from his dangerous vehicle. Almost the only source of consolation in connexion with his disappearance is the reflection that he had not acted in an imprudent or foolhardy manner; that he had fitted himself by long experience, and by the lessons of experts, for the most adventurous of all the methods by which men seek to widen the boundaries of science. The pursuit of the aeronaut is not merely danger and adventure. Even were it so, little perhaps could be said against an amusement which is exhilarating, and which demands a cool head and steady nerves from its votaries. But ballooning actually and directly adds to our knowledge of the meteorological conditions of our planet, and probably this is only the beginning of the services of the art of Icarus. From the very beginning of aeronautic science people perceived its great military importance—or, rather, its great promise as an addition to the mechanism of war. A school of aeronautic science was founded at Meudon soon after the beginning of the French Revolution, and a balloon was made for each of the four national armies. The enemy was reconnoitred from a balloon before the battle of Fleurus; and the French may, or may not, have owed their victory to the information thus obtained. But, whether the French learned much or not, it is certain that the less scientific enemy was much vexed and annoyed by being overlooked in this newfangled and unsportsmanlike manner. A balloon was sent up before Solferino; and the Americans were not a people to neglect balloons in their great civil war. The French, who invented balloons, have derived more military and political benefit from them than any other people. Sixty-four balloons were sent up during the siege of Paris; and sixty-two accomplished their voyage in safety, as far as reaching dry land went. It can scarcely be doubted that balloons have a military future before them, even if the nations' airy armies do not take to fighting in the central blue in the usually quoted manner. For revolutionary purposes, too, they may be found of use, if it be true that the Nihilists lately proposed to shell the Czar's palace by dropping dynamite from a balloon.

Balloons were an invention that, like printing, came almost at once to all the perfection that they have yet attained. Persons in the past had invented plenty of balloons. The Jesuits

Schott's would have been a splendid balloon. All that he needed for its construction was a quantity of the thin ethereal substance which, he believed, floated above our atmosphere. But how was Schott to obtain it? The Greek Prometheus, like the parallel hero of the Iroquois, was carried up to the heavens by birds, which obligingly stretched their wings beneath his body. But in Schott's time the birds were wilder and less serviceable. Laurens Laurus's idea of a balloon was to fill a leathern ball or a swan's egg with nitre, sulphur, or quicksilver, and then to expose it to the rays of the sun, when the bag, or egg, would ascend with a solemn and graceful motion. Laurus also averred that hen's eggs filled with dew would do the trick. These ideas were worthy of Lord Verulam's dreaming moments. Francis Lana (1670) started the first sound idea. He proposed to buoy up a basket with copper balls from which the air had been exhausted, and to rig the basket with a lug-sail. His calculations were beautiful, but in practice his balloon was unlike Galileo's world—it did not move. The first balloon that ever explored "the cold blue fields and folds of air" was that of the Montgolfier brothers. It ascended at Annonay on the 5th of June, 1783. This balloon was a linen globe, inflated over a large fire of chopped straw. As the air cooled, the balloon, having no source of heat within it, rapidly descended.

The eagle, according to the poet of the *Anti-Jacobin*, seeks the air, "not so the tortoise, and still less the bear." The first animals which ever really sought the liquid air in a balloon, were unadventurous in character, being a sheep, a cock, and a duck, which went up at Versailles, on September 19, 1783. All sped well, except that the sheep, a *mouton enragé*, attacked, and, we regret to say it, kicked the cock, and broke his wings. In less than a month after this experiment, Pilâtre de Rozier went up in a balloon, and flights became quite common. The two most adventurous of balloon voyages that have ever been suggested are the attempt to cross the Atlantic, and the attempt to reach the Pole. The former has attracted the disinterested attention of Mr. Barnum; the latter has been a good deal talked of, but it is doubtful whether it will ever be attempted. The difficulty is that a person starting to cross the Atlantic is just as likely as not to find himself at the North Pole, while a person making for the North Pole may find himself becalmed over the Atlantic. No amount of ingenuity has ever overcome the difficulty of steering a balloon. Till balloons can be steered no one should start for the North Pole in a balloon whose life is not *vile damnum*. Our ancestors, with their straightforward views of the propriety of utilizing criminals, would have started a crew of malefactors for the Pole. Probably a mutiny would have broken out, and a mutiny on board a balloon is one of the most fearful events that can be conceived. Or perhaps the crew, descending among Esquimaux that knew not white men or firearms, would infallibly have been recognized and detained as gods by these blameless Hyperboreans.

#### PIKE'S PEAK.

IN some weathers it is pleasant to take refuge among the mountains of Switzerland, or to explore the Highlands or the Lake country, if the clouds hold up. But to flatten one's nose against the misty window panes of a mountain inn for a week together is not exhilarating. On the eastern slopes of the Rocky Mountains such an experience is almost unknown. There it is as certain to be fine as it is certain to be wet in the Isle of Skye, and when the rain does fall it usually pours and has done with it. Notwithstanding these occasional downpours, the air is so dry that the highest of the Rocky Mountains is as free from snow during the month of August as Ben Nevis, though several peaks rise well above the level of 14,000 feet. Pines contrive to struggle up to the 12,000 feet line, and the clearness of the air dwarfs distances, so that there is hardly any indication by which the height of the mountains can be gauged by the eye. The distant view of the range is by no means striking, and cannot compare with the view of the Oberland from Berne; but the deep cañons and huge fantastically shaped and coloured rocks form a most curious and interesting spectacle. Several huge masses of red sandstone rise 350 feet straight out of the ground on what appear to be very insufficient bases. One is, moreover, much impressed with the appearance of unstable equilibrium assumed by enormous rocks poised somehow upon the steep slopes of the mountains. Again, by taking the trouble to walk or ride up any high peak, a view over the prairies of unsurpassed extent may be obtained, and the path can scarcely fail to lie through a picturesque country. A common excursion to make is from Manitou, a village about seventy miles due south of Denver, lying a few hundred feet above the prairie, and a little over 6,000 feet above the sea, to the top of Pike's Peak, some twelve miles distant and 8,000 feet higher. On the summit a weather-signal station is built.

Manitou is charmingly situate, with beautiful walks, rides, and drives in all directions. It boasts medicinal springs, and is asserted to enjoy the finest climate in the States for consumptive and asthmatic patients. Hence from June to October the hill-sides are dotted with tents inhabited by invalids who wish to combine economy with an unlimited supply of fresh air. The village counts among the attractions in its immediate vicinity a newly discovered cave of considerable dimensions, containing a fair show of stalactites. One of the two lucky explorers who revealed this feature of interest to the public was for thirty-two years

engaged as a lawyer in office work in the State of Ohio, and, on account of failing health, had to throw up his profession and take to digging or any other outdoor employment he could get. He and a friend bought the limestone rock enclosing the cave as a commercial speculation for burning lime; but the cavity has proved much more valuable than the solid rock, for visitors this summer have been plentiful at a dollar a head. Manitou is well supplied with riding horses and light carriages known as "buggies." On returning from a ride you have no difficulty in taking or sending your horse back to his stable; you simply throw the reins over the high Mexican pommel with which your saddle is decorated, and he finds his own way to his stall at a canter. It is said that if a visitor has the misfortune to tumble off, his steed never loses any time in notifying the fact at headquarters. We may mention that the Rocky Mountains are overrun by pretty little creatures of engaging habits, called "chipmunks." They somewhat resemble squirrels, except that their tails are not so bushy, and that the female is beautifully marked on the back. Should the traveller sit down to enjoy a sandwich in some secluded nook, he will find that his proceedings are watched with intense interest by these little creatures from every point of vantage. Lured on to taste a crumb or two flung towards them, they will soon advance within arm's length, and there proceed to sit up and discuss their food quite at leisure, keeping, however, their bright eyes fixed upon the intruder, so as to elude capture. Sometimes the possession of a choice morsel will be hotly contested between two or more chipmunks under one's very nose. The victor in the strife guards his treasure with the utmost vigilance, as he is quite aware that the defeated competitors have only retired as far as the nearest post of observation, and are ready to take immediate advantage of any remissness on his part. They are said to be easily tamed—indeed in their natural state they are the tamest of wild animals—and according to local report they have always thriven in captivity wherever they have been taken. The claims of the chipmunk as a domestic pet seem to us to rank in all respects higher than those of the prairie dog, an animal of very inferior presence, with nothing to recommend him except an amiable disposition, with which his rival is endowed in quite as large a measure.

The ascent of Pike's Peak is usually made on horseback; for, just as in Switzerland no one rides who can walk, so in America no one walks who can ride—the guides themselves accompany the expedition on horseback. It is a curious fact that, on attaining an altitude of about 12,000 feet, the pedestrian is attacked with a feeling of extreme lassitude and oppression not experienced on the Swiss Alps even at much higher altitudes. This statement we do not make only on our own authority. We have the assurance of a very distinguished mountaineer, well acquainted with Switzerland and the ranges of Central Asia, that it was as much as he could do to struggle up to the top of Pike's Peak. Occasionally a party will announce their intention of going up the Peak on foot to see the sunrise therefrom, and will make great preparations accordingly. They will start early the previous afternoon with a goodly supply of wraps and food, carrying revolvers to intimidate the bears; but, according to the inhabitants of the signal-station before mentioned, they usually arrive somewhere about 10 A.M., and are content to see the sunrise from a much lower level. Should you chance to fall in with a "sunrise" party on the mountain, you will find they are a little tetchy if you condole with them on the incomplete success of their expedition, and they will assure you with some warmth that sunrises can be seen just as well from the precise spot attained by them as from any more elevated position. After this assurance you would do well to drop the subject. The path all the way up is perfectly well defined, and no guide is needed. Wherever any reasonable doubt can arise a signpost reassures the traveller. It is practicable by moonlight, even through the forest, and a revolver is not a necessary part of the outfit, the chance of encountering a bear being remote in the extreme. The mountain buck, a species of wild ram much affected by the sportsman, is not unfrequently met with. Towards the top the path becomes bare and uninteresting, but for most of the way the scenery is picturesque, bold, and diversified. From the stony plateau on which the weather-signal station is built one can see about one hundred and fifty miles over the prairie, and on the opposite side a long range of mountains is visible. The station is a substantial building, containing three or four rooms, in which the two permanent inhabitants contrive to look very cheerful. The furniture of the principal chamber in this highest inhabited house in the world—14,150 feet above the sea-level—consists of an elaborate writing-desk, a large wooden bed, a few book-shelves, well filled, a stove, a table, and a few chairs. One of the signalmen, an ex-first-lieutenant in the American army, dispenses hospitality for a consideration. A cup of coffee with condensed milk costs 25 cents, or 1s., and the charge is the same for a glass of lemonade. The gallant officer is much pleased with his quarters, in spite of the low winter temperature, the mercury, or rather the spirit thermometer, having been known to recede to 47° below zero. He affirms that he never had a good night's rest till he attained his present elevation, having previously suffered from asthma. The number of signalmen attached to the station is three, of whom two are always there. Their experience of climatic changes must be interesting, as furious thunderstorms take place with short notice, and heavy gales come on quite suddenly in a clear sky, blowing over without a drop of rain, on which occasions the dust is intolerable. It may be mentioned as a piece of information not to be found in the guide-books, that Colorado swarms with household flies to such an extent as to amount to a perfect nuisance.

Another word of warning to the tourist. Let no one suppose that in an American watering-place, albeit in the Rocky Mountains, he can indulge unremarked upon in eccentricities or deficiencies of costume which he would not venture upon in a good hotel at Torquay. Englishmen who disregard the amenities of society in the matter of dress unwittingly arouse feelings of the bitterest animosity in the breast of the fair American, who considers herself entitled to be treated with respect even by dukes and earls. Civilization in the West is rapidly advancing. Denver is rightfully entitled to be called a city, inasmuch as it boasts a cathedral, a bishop, and a dean. Already lamentations are heard in the *Denver Tribune* over the exclusiveness of the local leaders of fashion. It is remarked in the columns of the same journal that it is no longer a common practice to walk about the streets with trousers tucked inside a pair of Wellingtons, and for our part we fully believe the day will come when it will be possible to put a brand-new pair of boots outside one's bedroom door to be cleaned, in the confident expectation that they will not be appropriated.

#### UNITED STATES SILVER COINAGE.

IN his Report, transmitted to Congress with the President's Message, the new Secretary of the Treasury recommends the repeal of that portion of the Bland Act which makes obligatory the coinage of not less than two million dollars of silver each month, and he also recommends that the silver certificates should be withdrawn and cancelled. Mr. Folger does not make these recommendations as a monometallist. On the contrary, he expressly states that his object is to bring about a concert among the European nations upon the silver question. In other words, he wishes to put pressure upon England and Germany to compel them to agree to the proposals made at the Paris Monetary Conference by the United States and France. It will be recollected that the Conference was adjourned until April next, and American bimetallicists have persuaded themselves that, if Congress would suspend the coinage of silver, both England and Germany would be compelled to accept bimetallicism. We find the reasons put forward for the recommendations by no means conclusive. As regards the silver certificates, we may perhaps explain that they are in the nature of deposit receipts, and that they pass current in the United States as money. Every holder of silver in the United States may lodge the metal in the Treasury and receive for it a certificate which entitles him to the silver at any future time if he wishes to withdraw it. Meanwhile the certificate passes from hand to hand just as if it were a Treasury note, and therefore goes to increase the paper circulation. By Act of Congress the number of greenbacks cannot be increased or decreased; and the effect, though not the intention, of legislation has also limited the issue of bank-notes. The issue of gold and silver certificates is the only means by which the paper circulation of the United States can be increased, and the eagerness of the public to obtain these certificates is strong proof of the great preference of the people for paper as opposed to coin. In fact, Mr. Sherman, just before he retired from the office of Secretary of the Treasury, authorized the sale of silver certificates for gold. He found that the silver coinage remained in the vaults of the Treasury, and, as he was anxious to obtain more gold, he offered to sell silver certificates to any one who wished for them in exchange for gold. The eagerness of the public for this new form of paper money was such that the whole of the silver certificates which the Government was able to sell has been bought up, and the certificates so bought were sent to the South and West. This eased the demand for gold which would otherwise have arisen when the movement of the crops began this autumn. The new Secretary of the Treasury, however, looks with disfavour on these silver certificates, and he states truly that their tendency is to displace coin, and at the same time to overburden the Treasury with the silver which has accumulated in such an amount as to constitute a real incumbrance to the Government. But this, of course, is a mere detail affecting only the United States. The question of interest to other countries is the recommendation to suspend the coinage of silver altogether, leaving only such a discretion to the Treasury as will enable it to meet actual demands.

The reasons put forward for the recommendations, as we have already said, are not satisfactory. Mr. Folger argues that the United States cannot give up gold altogether; and that, as the European Powers are not willing to adopt bimetallicism, the United States alone are not able to keep up the value of silver. Consequently, the United States, as things now stand, have to buy of others on a gold basis and sell to them on a silver basis—that is to say, that while the United States have to pay gold for all their purchases, they can be paid in silver for their sales. Now this is not correct. The Bland Act, as our readers may remember, authorizes only the United States Government itself to coin silver to the extent of not less than two million dollars, or more than four million dollars a month; consequently, no foreign purchaser of American goods can pay in silver, because he cannot send the silver to the American mints to have it there coined. And as a matter of fact we know that during the past three years the United States have taken from Europe nearly forty millions sterling in gold, while they have not taken an ounce of silver, and, on the contrary, have sold silver to Europe, though, it is true, only

to a small amount. But while the danger pointed out by Mr. Folger is unreal, there is unquestionably a danger in the present monetary system of the United States. As long as the great prosperity of the country continues—as long, that is, as its crops are abundant and the demands of Europe for its corn, cattle, cotton, and tobacco are on the present scale—the United States will be able to obtain as much gold as they please, and either retain or sell silver as suits them. But if adversity were to follow prosperity, if the crops were to fail or the exports to fall off, and the imports to increase, then the United States would become indebted to Europe, and would have to pay their debts in gold. Where two metals circulate side by side in the same country with equal efficacy to discharge debt, it is quite evident that the debtor will choose the cheaper metal rather than the dearer. In the open markets of the world silver is about 12 per cent. lower in value than gold, and, consequently, an American having to pay a debt in Europe would send abroad the gold which is full value all over the world, and would keep at home the silver which at home is of as much efficacy in discharging debt as gold, but abroad would be 12 per cent. less efficient. Consequently, whenever a time of great depression in the United States returns, there will be an export of gold, and silver will tend to take its place. This is the great objection to bimetallicism everywhere, and it is an objection in the United States just as much as elsewhere. Whether the export of gold is ever likely to assume such proportions as would render the United States unable to discharge their obligations in gold, is a question open to doubt. In California, for instance, all through the time of the suspension of specie payments, gold continued in circulation, greenbacks being almost unknown there. And it may be argued that a country growing in wealth and population so rapidly as the United States is never likely to be deprived of all its gold. But, whether this be so or not, undoubtedly the tendency of a double standard is what we describe it; and, had the Secretary of the Treasury based his recommendation for the repeal of the Bland Act upon this ground, his position would be unassailable. But, as we have just seen, the grounds on which he bases it are different. It is, in fact, neither more nor less than an attempt to coerce England and Germany into bimetallicism.

How far the recommendation is likely to be successful in Congress is a question not easily answered as yet. It is always to be borne in mind that an American Cabinet Minister is not like a Cabinet Minister in this country. He is not the leader, or even one of the leaders, of his party. He does not even necessarily hold any position in politics. He may, in fact, be raised from obscurity by the mere choice of the President. His recommendation, therefore, carries no special weight with it; and, in the present instance, Mr. Folger, who was the Chief Judge in one of the State Courts of New York, is singularly devoid of influence with his party. The mere recommendation of the new Secretary of the Treasury, therefore, will carry no weight with it unless the feelings of the party happen to be in the same direction. Nor is it to be supposed that the new President will be able to exercise a great influence over the discussions in Congress. President Arthur succeeds to office by a mere accident. He was not chosen by his party as a candidate; and the electors, in voting for him, had no expectation that he would so soon succeed to the first place in the State. Although, then, President Arthur endorses the recommendations of his Secretary of the Treasury, the endorsement is not likely to carry with it any great weight. And, so far as we can judge of the opinions of the majority in Congress, they are not likely to be in favour of a repeal of the Bland Act. The Republican party is Protectionist for all American industries, and silver-mining is a great American industry. The proposal, in fact, is to deprive silver-mining alone of all industries of the United States of protection, with the certain result of reducing its price very seriously. The silver interest throughout the country may be counted upon confidently to oppose the recommendation by every means in its power; and, as the whole Protectionist party is threatened by the agitation for the reduction of the tariff, all the Protectionists will be likely to rally to the aid of the silver party, in the hope of gaining thereby assistance for themselves. And they will be strengthened by all the currency-mongers; by the people who wish for an enlarged issue of paper—the “soft-money” advocates, as they are called; by the opponents of free banking; and generally by all the crocheteers, as well as by all speculators “for the rise,” to whose hopes a contraction of the currency would be fatal. Nor is there anything in the present condition of the country that would lead Congress to entertain apprehensions for the stability of its credit. If gold were ebbing away, Congress might be frightened into a measure of this kind to stop the outflow. But, on the contrary, gold has been pouring into the country in immense amounts for the last three years, and the one overmastering fear amongst the trading classes in Europe at present is that the United States may take away still more gold. The silver party, therefore, will be able to answer all the arguments of Mr. Folger and his friends by the irrefutable assertion that the coinage of silver has not prevented the flow of immense masses of gold into the United States, has not flooded the United States with a silver currency, and has not prevented the accumulation of a vast amount of gold in a very short period. Nor is it likely that Congress will look upon the measure in the light in which it is regarded by Mr. Folger, and believe that it will coerce England and Germany into acceptance of bimetallicism. To proclaim that bimetallicism, having been tried in the United States, is a failure and has to be

given up, is hardly the way to persuade Europe to adopt bimetalism; and Americans are keen enough to see the absurdity of such a mode of reasoning. It does not seem probable, then, that the recommendation will be successful in Congress; but at this distance of course it is impossible to form a confident opinion upon the subject. As all experience tells us, the decisions of deliberative bodies are often swayed by considerations which entirely escape the foreign observer.

But, even if the recommendation should be adopted by Congress, it is not likely to have the effect anticipated. Mr. Folger assumes that if the coinage of silver were suspended, and if the silver certificates were withdrawn, a void would be created in the circulation of the United States which would have to be filled up by gold; that, consequently, a further drain of gold from Europe would set in; and that Europe, alarmed by the increasing scarcity of gold, would agree to accept bimetalism to avert a worse danger. But this reasoning appears to us faulty in many particulars. In the first place, it seems clear that the circulation of the United States is now ample for all purposes. From the experience of various countries it is observed that after a long period of depression the circulation steadily increases for about three years, when there is a stationary period, which again is followed by a contraction of the currency. Now the three years' expansion in the United States has occurred, and it does not seem likely that further expansion of any appreciable amount will take place. Should it, however, occur from withdrawal of the silver certificates, it is probable that the void thus caused may be filled up by an increase of bank-notes. At present the heavy tax imposed upon bank notes in the United States prevents the expansion of the note circulation; but one of the proposals, not merely of Mr. Folger, but of all parties in the United States, is that the tax upon banks should be entirely repealed. If this is done, the present obstacle to the expansion of the note circulation would be removed, and notes then would naturally take the place of the silver certificates withdrawn. But granting, for the sake of argument, that there did arise a further demand for gold in the United States, and that a large drain from Europe were to set in, it by no means follows that there would be the struggle of which we hear so much. All the Powers of Europe, small as well as great, may take part in a general war, because there are only two sides in a general war, and the smaller Powers may range themselves, according to circumstances, on the one side or the other. But in the apprehended struggle for gold each State would fight for its own hand; in other words, each State would have against it all the other States using gold. Now it is quite clear that in such a struggle the poorer States would at once succumb, and the richer States would retain their gold. It may safely be affirmed that the United Kingdom, the United States, and France, can and will retain the gold needed by them whatever struggle may arise, and that the poorer States, such as Germany and Italy, will have to part with gold, and to put up with other substitutes. Instead, therefore, of a general and prolonged struggle making money dear, the probable result in the case anticipated would be that the poorer States which are now aspiring to have a gold currency would discover that they had made a mistake, and would either altogether drop the gold currency, or would supplement it by a silver currency. Moreover, the very fall in the value of silver, from which such dire results are anticipated, would make it more advantageous for the poorer countries which have still to resume specie payments to resume in silver. If Austria, for example, were to decide at once that she would resume in silver, she would be able to do so with much less cost to herself than if she were to try to obtain the costlier metal, gold; and so it would be with all the other poorer States of the Continent. We see no reason, therefore, to fear any great disaster to Europe, even if the United States did pursue the policy recommended by the Secretary of the Treasury, and we feel confident that no mere coercive measure of the kind will induce the Governments of England, France, and Germany to change their settled policy. For our own Government, at any rate, we may without presumption venture to say that it will not be driven to adopt a monetary system which it believes to be bad, because another Government drops that system.

## REVIEWS.

### BLUNT'S ANNOTATED BIBLE.\*

WE cordially hail the appearance of the concluding volume of the most important of Mr. Blunt's numerous and valuable works. It has the distinctive merit of being in reality what he claims for it on his title-page, a "Household Commentary" on the whole Bible, including the Apocrypha, which portion is entirely overlooked in more pretentious and costly editions of Holy Scripture. In the Old Testament Mr. Blunt had the field pretty much to himself, for no one would think of using for family reading the Bishop of Lincoln's learned and exhaustive annotations, or that very unequal and somewhat incongruous collection of sepa-

rate expositions of the several inspired books which composes *The Speaker's Commentary*. These labours, especially Bishop Wordsworth's, bearing as they do the impress of a single earnest and ingenuous mind, while they are almost indispensable to the student, are wholly unsuited to the wider audience addressed by our author. In the case of the New Testament, however, his difficulties were greater, and his rivals can hardly be counted for number and variety of aim. Canon Westcott's *Gospel of St. John* contributed to *The Speaker's Commentary* will long stand by itself for freshness of conception and completeness of execution, the ripe fruit of twenty years of toil and meditation; while the three volumes edited by the Bishop of Gloucester for Messrs. Cassell and Co., amidst much that is fanciful or weak even to puerility, must needs afford scope for detailed explanation of a popular character on a scale which Mr. Blunt's plan will not allow. His best claim on public acceptance is grounded on his uniform and consistent treatment of every book of Holy Scripture consecutively, in the course of which he brings to bear as much special learning as the general reader will appreciate or digest, and in regard to matters of pure scholarship is more careful to state clearly the results at which he has arrived than to describe the processes by which his conclusions have been reached.

Such a Commentary as these volumes embrace must of necessity be, to some extent, a compilation; but this by no means excludes originality and independence of thought on the part of the compiler. These characteristics are very conspicuously exhibited in every part of Mr. Blunt's present work. He is an English Churchman of the higher type, ever anxious to illustrate the Book of Common Prayer and the authorized teaching of his communion from Scripture, as Scripture was received and believed on in the primitive ages of the Gospel. Yet, with all his potent and avowed prepossessions in behalf of Catholic doctrine, we occasionally find him over-cautious in adopting interpretations well vouched for by the ancient Fathers. Thus, in the grand passage 1 Tim. ii. 15, where the Authorized English Version gives for *αὐτῆς τῆς τεκνογονίας* "she shall be saved in child-bearing"—a sense neither suited to the context nor easily extorted from the Greek—the Revised Version boldly sets in its text "she shall be saved through the child-bearing," that is, through the Incarnation of the Saviour of the world; which is the only meaning deemed possible by the older interpreters, and is powerfully vindicated by Bishop Wordsworth, as before him by Hammond, the most devout and sober of our vernacular expositors. Mr. Blunt, however, shrinks through mere timidity; "although this may be accepted as a subordinate sense," he writes, "it cannot be regarded as the principal and literal one," and so falls back upon a poor commonplace reference to John xvi. 21. Yet this exceptional error of judgment (in our author's case it is very exceptional) indicates a tone of mind which keeps him safe from the rash surmises of modern speculation, and leads him to suspect an ingenious theory all the more because it is new.

We meet with a refreshing example of Mr. Blunt's tenacity of old-world notions in his claiming for St. Paul the authorship of the Epistle to the Hebrews. So far as we remember, he is, with the exception of a contributor to the *Church Quarterly Review*, the only very recent writer that has ventured to maintain this opinion. Dean Plumptre has been pleased to revive what, but for his advocacy, we should have called the idle guess of Martin Luther, who ascribed it to Apollon, "although there is not a scrap of writing which can be authenticated as that of Apollon and used for the purpose of comparison, and no ancient writer ever attributed any work whatever to him" (p. 594). Another and not less considerable scholar has proclaimed from the chair of theology in a great English University his high gratification that some second person, distinct from St. Paul, but as richly endowed as he in spiritual wisdom, had been raised up to edify the Church in this noble Epistle, and had then fallen back into such utter obscurity as to have left not so much as his name behind. The arguments by which the Apostle to the Gentiles has been proved to have penned, or at least to have dictated, the Epistle, whether derived from patristic authority, or from the place it held in the most venerable Greek manuscripts, or from minute resemblances in style or modes of thought, are fully set forth in Mr. Blunt's introduction to the book. Yet he, too, has his own peculiar conjecture respecting it, which, to the best of our knowledge, is propounded by him for the first time—that, by reason of its regular form and didactic structure, it was in substance the discourse delivered to the assembled Jews when St. Paul first went to Rome (Acts xxviii. 23-29), supplemented by a few insertions here and there, and by the addition of the last chapter two years afterwards, which gave it the shape of a circular letter. In respect to another question much debated of late years—the date of the Apocalypse—our author departs more than is his wont from the tenor of early tradition, assigning it to a period antecedent to the fall of Jerusalem, either immediately before or not long after the death of Nero, June 9th, A.D. 68. There is no doubt that this hypothesis best suits the literary phenomena of St. John's existing writings, and accounts for the Hebraic structure and rough style of the earlier book by the supposition that little less than a quarter of a century, spent amidst the culture of Asiatic cities, intervened between the time in which it was composed and the writing of his Gospel and three Epistles. All other arguments for so early a date fail us when closely examined, and it is strange indeed that the Church of Ephesus, while Timothy was its Bishop, should be addressed in such language as St. John employed in Rev. ii. 1-7 in the very

\* *The Annotated Bible; being a Household Commentary upon the Holy Scriptures, comprehending the Results of Modern Discovery and Criticism.* By the Rev. John Henry Blunt, M.A., F.S.A., Editor of "The Annotated Book of Common Prayer," "The Dictionary of Theology," &c. Vol. III. The New Testament. London: Livingtons, 1882.

year that St. Paul died. The plea that by the mystic number 666 (Rev. xiii. 18) *Neron Kesar*, expressed in Hebrew letters, is indicated, is not so much as named by Mr. Blunt. It more fittingly commends itself to the taste of Canon Farrar and similar writers.

The praise we have cheerfully accorded to this Commentary, almost entirely the work of a single mind, and so insuring a general harmony of treatment throughout (Vol. I. p. vi. Preface), admits on one point of no slight modification. In the introduction to the whole work in the first volume we have a sufficiently ample account, illustrated by a few facsimiles, of the chief Greek manuscripts which contain the New Testament or parts thereof, such as might readily be supposed to set before the reader by way of preparation some acquaintance with the evidence on which rests the sacred text whose integrity cannot but nearly concern every Christian, and which circumstances have brought prominently to the front of late years. Not, of course, that a Household Commentary can enter fully upon the details of textual criticism; but that if there are passages in the English New Testament (and there are not a few) either ascertained to be ungenue, or reasonably suspected to be so, it is the plain duty of those who undertake to guide the simple reader to apprise him distinctly of the fact by way of putting the unwary on their guard. The notification may be made very briefly, but in no important case should it be overlooked altogether. Now it is our grave complaint against Mr. Blunt that he has grievously failed by omission in this matter. Not that we would wish him to have troubled the minds or vexed the patience of plain men in weighty passages like Luke xxiii. 34, which the exigencies of Dr. Hort's elaborate and far-fetched hypotheses have forced him to call in question, in that instance sorely against his own will and instinctive sense of right. A capital error of this kind is best relented by Mr. Blunt's entire silence; but it is not fair that those who use his book should be left quite in ignorance of the doubts cast by modern editors, however unjustly, on the authenticity of the last twelve verses of St. Mark's Gospel, or on the narrative of the bloody sweat (Luke xxii. 43-44). Even such palpable corruptions as the quotation from Psalm xxii. 18, in Matthew xxvii. 35, and "her" in Luke ii. 22, are allowed to pass unchallenged; and, to name three examples out of hundreds, he ought surely to have stated the difficulty which rests on "without a cause," Matthew v. 22, on "we have," Romans v. 1, and on "broken," 1 Corinthians xi. 24. We must add, however, that several variations of prime importance (e.g. Acts xx. 28, Eph. i. 1, Col. ii. 2, 1 John v. 7-8), are marked by our author, who refers in each case to Scrivener's Introduction for a fuller account; that 1 Tim. iii. 16, 1 John ii. 23, and the perplexity in Jude, ver. 5, are carefully examined in his notes, although the paragraph John vii. 53-viii. 11 is more confidently upheld than the evidence seems to warrant, and the case for maintaining Acts viii. 37 is hardly so strong as is represented. Thus it is not a systematic avoidance of the whole subject of biblical criticism that we have to deplore so much as a fitful, partial, and inadequate representation of the problems which it suggests.

As the present volume appeared about November 1881, six months after the publication of the Revised Version of the New Testament, we have tried to find out what influence the latter may have had on Mr. Blunt's decisions in difficult places. He nowhere mentions its existence, so far as we can perceive, and his last note on the Revelation bears date August 21, 1880. In the preface also to his first volume (1878) he seems to speak of the whole Commentary as already written (p. vi. and note 2); but such expressions must obviously be understood to admit of changes and insertions as the work passed through the press. At all events, although for some cause our author does not name the Revised Version, we find unmistakable signs of his having used it, especially towards the end of the New Testament, and that to the benefit of his own labours. But, indeed, it is not at all frequent throughout this Commentary for authors to be cited by name. Dean Alford's and Mr. Darby's translations are laid under contribution in just the same manner; they are probably never mentioned by name, nor in a popular work like this is such reserve deserving of censure; it would have been blameworthy and presumptuous, through indolence or conceit, not to have availed oneself of the fruits of other men's exertions. To this third volume is prefixed a careful "Historical Introduction to the New Testament," covering about twenty pages, wherein the temporal fortunes of the Jewish people, and particularly of their sovereigns of the Asmouean family, are distinctly traced. Nearly all that is contained in this historical outline is likely to be new to the class of persons for whom Mr. Blunt writes. Less interesting, but perhaps quite as instructive, is a short treatise on the Gnostic heresy in its infinitely varied forms, which comprises an appendix to the First Epistle to Timothy. It is a subject which our author's earlier studies had rendered familiar to him, and we know not that any competent judge can avoid assenting to his conclusions:—

From every point of view Gnosticism must be regarded as an anti-Christian school of thought. Springing up, as it did, almost immediately after the leading doctrines of the Christian Faith were first proclaimed by the Apostles, it represents the second of the great assaults which the Enemy of Christ made upon Him and His work [the first being mystic or Cabalistic Judaism, according to Mr. Blunt]. Spreading over the civilized world as it did, and containing within the compass of its doctrines the substance of all later heresies, it was the greatest and most dangerous system of antagonistic doctrine that Christianity has ever had to withstand.

The volume concludes with a very full index of seventy closely printed pages, "so arranged as to answer, to a considerable

extent, the purpose of a concordance." We have found it very accurate so far as we have had time to test it, and no one who has ever tried to execute such a task can help commending the patient diligence so freely bestowed upon it. Taken generally, then, it would be difficult to mention any recent Biblical work which more completely answers the want it was designed to satisfy. Moderate, sufficiently learned, rigidly orthodox in the best sense of the term, we hope that this Annotated Bible will find a place in every family whose head cares less for that which is novel than for the time-honoured truths of Christian teaching. Faults in detail it of course has, one or two of which we proceed to touch upon, but they are too few to detract materially from the substantial merits of the whole. Our editor, after his manner, does not appear to name Bishop Lightfoot's splendid monogram on the Epistle to the Colossians (is it fated to be the last great literary effort of that distinguished prelate?), yet he cannot but have studied it, at all events when he wrote his essay on Gnosticism. We should have thought that the Bishop had settled once for all the true construction of that very hard verse Col. ii. 23. "The preposition *πρός*," as he states, "like our English '*for*,' when used after words denoting utility, value, sufficiency, &c., not uncommonly introduces the object to *check*, or *prevent*, or *cure* which the thing is to be employed." Hence the last clause of the verse is rightly translated in the Revised Version "not of any value against the indulgence of the flesh." Mr. Blunt, on the other hand, following in the wake of Alford and Darby, but with a rendering less probable than either of those which they suggest, not only separates *ἐν τῇ τῶν* from *πρός πλῆσμον τῆς σαρκός*, but favours us with a note, whose substance ill justifies the complacency with which it is introduced:—

The whole verse might be better translated, "Which things have indeed a talk of wisdom, in voluntary worship, and in lowliness of mind, and in punishing of a body not honourably esteemed, to the satisfying of the flesh."

One other attempt to draw the bow of Ulysses, if not very successful, involves a less signal failure:—

2 Tim. ii. 26.—The sense here is "and that, at His will, Who peradventure will give them repentance [ver. 25], they who have been taken captive by him who has ensnared them may recover themselves out of that snare of the devil."

The passage is hard enough any way:—*ἐξωγρημένοι ὑπ' αὐτοῦ εἰς τὸ ἐκείνου δέλημα*. Mr. Blunt takes us to 1 John iii. 3 to show that *αὐτοῦ* and *ἐκείνου* must relate to different persons. But to whom? "His will" must be God's will, as the editor rightly indicates by printing "His" with a capital letter, though the capital is not found either in modern Bibles or in those of 1611. On the other hand, it seems more natural to refer *αὐτοῦ*, not to the Devil, but back to "the Lord's servant," in ver. 25. The Revised Version, whose margin virtually agrees with Mr. Blunt, and inserts a strong comma after *αὐτοῦ*, bravely sets in its text "having been taken captive by the Lord's servant unto the will of God."

One more point only have we space to notice before parting with this, on the whole, judicious and always most useful Commentary. Our author, in his notes on 2 Thess. ii. 3, 4, has carefully gathered up into one view the significant notices of Antichrist and his kingdom scattered throughout the Old and New Testaments. He determines that they have reference to no power, prelate, prince, or potentate hitherto revealed to the world, but to a real individual person yet to set himself up as a rival to Christ and God in the season of general—almost universal—apostasy which shall characterize the latter days immediately before the end. He furthermore intimates that the seat of the deceiver's dominion will be some mighty city, a mystical Babylon, flourishing in abundant wealth, where, next to Antichrist, money shall be the object of adoration; some richer London, nay, possibly, some future New York.

#### THE HEAD HUNTERS OF BORNEO.\*

IN these days of rapid locomotion we must not be surprised at finding a Scandinavian in the wilds of Borneo. Mr. Bock went out to Sumatra at the instance of the late Marquess of Tweeddale, and while engaged there in the collection of specimens of natural history, was deputed by the Dutch Government to visit the south-eastern part of Borneo. This volume is the result of the author's travels in the comparatively civilized country of Sumatra, and of his adventures in scenery and among people rarely visited by any European. Readers will note that the visit to Sumatra, though prior in time, comes last in the narrative. Mr. Bock has obviously many of the qualifications essential to success in all such venturesome expeditions. His powers of endurance must have been considerable. There is abundant proof that he is a man of tact and resources. His health does not seem to have suffered, though he was more than once attacked by fever; and while he has wisely compressed the overland route into half a page, and only just touched on the sights of Sourabaya, the remainder of his pages are devoted to Dyaks and their customs, to some remarkable aborigines known as the Forest People, to the Sultan of Kotei, and to native habits and tropical vegetation. In one or two minor points of the outfit there was some carelessness shown. The author took

\* *The Head Hunters of Borneo: a Narrative of Travel up the Mahakham and down the Barito; also Journeys in Sumatra.* By Carl Bock, late Commissioner for the Dutch Government. With Plates, Map, &c. London: Sampson Low & Co. 1881.

care to provide himself with suitable clothing, provisions in tin, and an ample store of presents to serve as diplomatic solvents. But it never occurred to him to buy a couple of mosquito nets, and he suffered frightfully from those insects, owing to the want of this simple precaution, as must be the case in a tropical delta. His very shoe leather, too, was deficient. On one occasion he was incautious enough to open an umbrella while on horse-back, frightened his steed, and narrowly escaped death. At first he was wholly ignorant of the Malay language, but we gather that he made up for this deficiency afterwards. He has given us a short vocabulary of one dialect of the Dyaks, but he has clearly no solid foundation of Oriental literature. Malay phrases are given over and over again, coupled with some terms derived from the Sanskrit, and with others which are pure Persian or Arabic. A "bitchara," or conference of chiefs and people, is simply the Sanskrit *Vichāra*. *Slaamat* should be written *Salamat*, and *Sabundur* is the "Shah-bunder," or harbour-master, a term familiar at seaports from the Persian Gulf to the Malay Archipelago. *Mantri*, or minister, is pure Sanskrit. *Hormat*—it should be *hormat*—is respect or honour, on which most Orientals set a higher value than on any one moral quality, except perhaps female chastity. *Mingit* is a misspelling of the Arabic *masjid*, a mosque; and there are diverse other terms of the precise birth and derivation of which Mr. Bock is evidently unconscious. In one place, in the middle of a dense forest, he saw a Hindu idol, said to be of stone but in reality of bronze, which he wished much to buy. It was known as *Dingaupti*, and a Dutch writer quoted by the author called it *Gendawagic*. We hazard a conjecture that the original name, transformed through Batavian and Dyak utterances, may have been *Gunga Devi*, the holy Ganges. But, if Mr. Bock fails to a certain extent as a linguist, we gladly bear testimony to his high merits as a draughtsman. The narrative is helped and illustrated by a few choice engravings and some thirty coloured plates which are truly admirable. Dyaks with their shields, spears, and leopard skins; palaces, huts of bamboo, and sepulchres, in which chiefs lie in state; women adorned or rather disfigured by marks of the tattoo, with pendant ears, highly coloured head-dresses, and gigantic earrings; native servants with smooth faces and light skins; cannibals and human skulls, the sword, the blow-tube, and varieties of domestic implements—all of them, we apprehend, taken originally on the spot and under considerable difficulties and interruptions, give a force and a fullness to Mr. Bock's descriptions which it is scarcely possible to exaggerate. No photography was resorted to. Indeed, Dyaks, who were occasionally suspicious, would certainly have resented the intrusion of a camera.

Mr. Bock's journeys may be summed up as the ascent of two rivers in Eastern Borneo—the Mahakkam and the Krito—varied by a land journey which enabled him to get from one river to the other, and an occasional stay of days or weeks at capitals or important towns in the interior. One of the most prominent personages met in these wanderings was the Sultan of Keetoi, a Mohammedan potentate whose trading port is Samarinda, near the mouth of the Mahakkam. His capital is Tangaroeng, higher up the river, with a population of 5,000. Many of the houses are raised on posts above the tidal waters, and some are mere floating rafts. The effluvia from putrid fish and all sorts of refuse are described as abominable. But the Sultan is a man of pleasing address, and of as much progress as is consistent with despotic power and complete isolation. If somewhat given to break one contract when a more advantageous offer is received, he has suppressed the slave-trade, and he has grasped the idea that his country must be populous in order to be great. He takes interest in European politics, and is familiar with the names of Bismarck, Von Moltke, and other "men of the time." It was perhaps hardly to be expected that he should pay his household regularly, should not punish theft sharply and summarily, or should not take delight in the national sport of cock-fighting. He was also rather fond of gambling; but, except that he permitted his servants to delay Mr. Bock's start up the country, his treatment of the author was kind and considerate; nor does he seem to have felt that undefinable but not ill-grounded fear and dislike of white men, who in the East have a knack of coming for commerce and remaining for empire. Shortly after leaving the capital of the Sultan Mr. Bock got a sight of the Orang Poonan, or forest people. About a dozen of these aborigines came to visit a Raja with whom the author was staying, and he was fortunate enough to be taken by a native chief to see how these wild men lived in the thickest recesses of the forest. These tribes, like the Veddahs of Ceylon, pass day and night entirely in the open air, with no other shelter than a mat. They keep up fires all night. They wear a head-dress and a waistcloth of bark, and eat monkeys and game, which they kill with the *sumpitan* or blow-tube and poisoned arrows. The women are fairer than the Dyaks, but very dirty in their persons. They welcomed Mr. Bock by asking for beads and tobacco, which were gladly given in exchange for combs and the plates on which the poison is prepared. They enjoyed a good meal of rice, as a pleasant change from serpents and monkeys, and begged for empty cartridge-cases to make ornaments for their ears. If male specimens of these jungle folk have been "interviewed" by former travellers, the author may record with just pride that no European except himself has ever seen and talked with one of their women.

But, after all, the main purpose of the expedition was to learn more of the Dyaks. The Dutch Government wanted a report on these barbarians, and Mr. Bock was determined to visit them,

all hints, doubts, fears, and impediments notwithstanding. A chief of the cannibal Dyaks is described in one of the most powerful and disagreeable pages we have lately read. His appearance merits the term "unmatched physiognomy" which Brougham attributed to one of the lying witnesses in Queen Caroline's trial. This wretch had just slaughtered and, with his followers, eaten up seventy victims. He allowed himself to be sketched, and presented the author with two crania and a shield in return for rice, beads, and twenty-four yards of calico. A high priestess of these savages gave her own opinion on human flesh, and stated that the palms of the hand were considered the best eating—a preference which, we are reminded, was not shared by the dogs that devoured Jezebel. Of course such a visit would not have been complete without a war-dance, which was executed by a Dyak with much shouting, stamping, and flourishing of a sword, for a present of two dollars. A Dyak is never without his sword and his basket for betel and tobacco. Generally he wears a cloth or piece of bark round his loins, and a covering for the head of the same material. Of a chief in his war dress there is a very good plate at p. 184. The women have not much more clothing than the men. The lobes of their ears are hideously enlarged by artificial means; and, when a warrior has secured a good many skulls, he is allowed to deck his ears with the canine teeth of a leopard. The minute descriptions of ornaments and tattooing make up nearly a chapter. Quite as much space is devoted to national weapons. Here and there an old-fashioned gun is found; but the native armoury consists of the sword, or *mandau*, the *kliau*, or wooden shield, the blowing-tube, and the arrows dipped in a poison which enables the Dyak to bring down the smallest bird at forty or fifty yards off with unerring aim. The Dyak's house is very properly raised off the ground, to avoid the ill effects of damp; a precaution somewhat neutralized by the exceeding filth allowed to accumulate under the open platform which represents the flooring. The chief material for building is bamboo, with a covering of palm leaves and wooden tiles. The Dyak is an æsthetic and collects old china. When he does not eat human flesh he lives on rice, which would give him a plentiful return were it not for swarms of rats and mice. At other seasons the Dyaks collect resin and guttapercha, and cut enormous quantities of rattans, which are brought down the Barito on rafts and sold to Chinese or Malay traders. The wild men of the woods are the chief suppliers of edible birds' nests and the bezoar stone. Against cannibalism and a passion for heads Mr. Bock pleads, as a set-off, the high character of the Dyak for honesty and truthfulness. They have, all but the chiefs, one wife each; are great smokers; drink nothing spirituous beyond a preparation of honey; and are liable to fever, dysentery, and diseases of the skin. In short, but for one practice, they would be considered harmless and primitive people, less bigoted than Mohammedans and far purer than ordinary Hindus. But when we are told that no cereunies are complete without heads; that births, marriages, and deaths must be sanctified by the capture of some scores of enemies; that men are enslaved and reserved for tortures which exceed the refined cruelty of Pawnees and Siouxes; and that Rajas and chiefs cannot understand our objections to wholesale murder, we can only endorse the hope expressed by the author to the effect that this practice, if persevered in, must lead to the rapid extinction of the race. A very curious feature in the Dyak religion is the detail of the actual route by which a deceased chief is supposed to reach heaven. The pilgrim in his progress crosses rivers, climbs mountains, goes through a valley of tears, propitiates animals, takes a bath, eats fruits, and is reunited to his parents.

It is rather a relief to turn from these barbarities to some of Mr. Bock's descriptions of the franks of nature in this unexplored region. He went to shoot boars, and after sharing in the death of six of these animals he saw, at a distance, a burning bill which he was informed was a coal formation that had been on fire as long as any one could remember. After leaving Tangaroeng, on the Mahakkam, he saw a lofty tree quite covered with bees' nests in process of construction and of various sizes; the smallest was nearly two feet long. But the honey and the wax were inferior to those of colder climates. Near this place the effects of the drought were worse than in India, though there was much less population to suffer the horrors of famine. The trees were bare of leaves—a rare sight at any time of the year in the tropics—and birds and beasts had either migrated or had been killed by the want of water. A narrow stream, called the Gadung, led to a lake which seemed to have no shores—that is to say, the lake had overflowed and huge trees were standing deep in the water. The narrative here reminds us of some parts of the Upper Amazon as described by recent travellers. Shortly after this the party entered another stream which had only a foot of water, and the channel was so narrow that the canoe was dragged by main force through the trees, reeds, and grass. To this boating succeeded a march through an undulating country and over rivulets and streams bridged by the simple expedient of cutting a tree on the bank and letting it fall over the torrent, or else by joining two bamboos together and adding a slender railing three feet above the footway. Coolies with burdens easily trotted across these rickety bridges, while Mr. Bock looked on with amazement, like the Mr. Briggs of Leech's pictures when Donald crossed a river. It was at this part of the expedition that Mr. Bock saw trees of which the roots grew ten, twelve, and fifteen feet above the soil. The roots were interlaced and tangled in every direction, the trunk of the tree springing not out of the ground but from the top of this

abnormal growth. The explanation given is that the soil is so rich from the decayed vegetation of centuries, that the trees were prematurely forced into the air above ground, or had dragged the roots up out of the soil by sheer rapidity of growth. We hardly like to hazard the suggestion that violent tropical rains might have washed away the earth from the roots, though it is clear to us that Mr. Bock avails himself of the action of rain to explain the appearance of a Field of Stones of every shape and size, from small pebbles to gigantic boulders many tons in weight. Several of these formations had been overgrown by rank vegetation, and the natives had stories of subterranean caverns, and, we doubt not, of hidden treasures. Mr. Bock discards the theory of volcanic agency to produce this result, as there is neither trace nor tradition of such phenomena in Borneo. In such descriptive passages the author is at his best, and his account of Bandjermasin, where a population of 38,000 souls live in houses floating or built on piles, reminds us of Tom Hood's phrase of a "sort of vulgar Venice," applied by that humourist to the city of Rotterdam. The notices of animals will be interesting to naturalists. There is the Sânt, or Gobang, described pithily as a stinking badger, from the fluid which it emits from two glands under its tail. The scent is a cross between Peruvian guano and muriatic acid. Then there is the binturong, half way between a civet cat and a bear: the long-nosed monkey, from its long fleshy proboscis; the honey bear; a harmless species of leopard, and the tiger cat. The rhinoceros is found in South-Eastern Borneo, but not the tiger. The jungles swarm with wild pigs, and in some of the open districts deer are plentiful; but we should hardly advise any sportsman, driven away from England by the Ground Game Act, to visit Borneo in the hope of large bags. Snakes are numerous, and ants in Sumatra were pests; but Mr. Bock once utilized these insects to clean the head of a fine tapir. He buried it in the ground under an ant's nest, and in a few days it was effectually cleaned of all corruptible matter. His travels in Sumatra took the author to pleasant bungalows and sanatoria on the hills more than 3,000 feet high, and here he made the acquaintance of a celebrated native hunter who could kill tigers single-handed as well as the bravest of Indian *shikaris*. We share the author's regret at the loss of his collection of skins by shipwreck in the Red Sea, and may congratulate him on the safety of his own. His lost collection might have gratified the zoologists of Batavia or Amsterdam, but it would scarcely have enhanced the value of his narrative in the opinion of Englishmen.

#### A GRAPE FROM A THORN.\*

MR. PAYN is one of the fortunate novelists who predispose both readers and reviewers in their favour. For he appears to be gifted with inexhaustible freshness, and his stories are full of varied interest. He constructs a clever plot; he creates characters who are not only lifelike but full of life; and, overflowing himself with drollery and anecdote, he makes even the slowest of his slow folks unnaturally entertaining. But as that is a fault on the right side, it is a fault to which we take little exception. As a rule, a prolific novelist is apt to become an intolerable nuisance, and would speedily relieve us by committing literary suicide, were it not for the necessities of the circulating libraries. But we doubt if Mr. Payn could do himself greater justice were he to bestow more time and thought on his productions. For the author of *Lost Sir Massingberd* and *By Proxy* has naturally a brilliant inventive faculty, and he draws readily for his delineations of all manner of men and women on a wide knowledge of the world. Experience, which has taught him the tricks of his trade, has warned him before all things against being tedious. And so in *A Grape from a Thorn* he plunges at once into the middle of things, and introduces us to the mixed society of the novel. The company assembled for the season in the Ultramarine Hotel at the rising watering-place of Wallington Bay is by no means very select, although aspiring to be super-refined; but it is not the less amusing on that account. The queen of the circle is a certain Mrs. Armytage, who would fain govern rather than reign constitutionally, and who consequently must repress dissection among the envious. We need hardly say that her struggles to assert her supremacy give occasion for many lively passages of words, in which Mr. Payn shows himself at his best. There is not one of the party meeting daily at the Ultramarine *table-d'hôte* who is not something of a character or an eccentricity. Mrs. Armytage's husband and paymaster is a professor and *savant* of distinction, who devotes himself literally to the pursuit of entomology. He is ready to make any sacrifice in reason for a quiet life with his wife, even to the extent of leaving her the lion's share of the daily bottle of champagne, although he likes the wine in its way almost as much as his beetles and butterflies. As Mrs. Armytage can keep her carriage and drink champagne, it may be presumed the Armytages are sufficiently well to do in the world; but she has a rival near the throne in a Mrs. Jennynge, who prides herself on superior riches. Mrs. Jennynge's social pretensions are bitterly ridiculed by Mrs. Armytage, and it must be confessed that the Professor's lady has reason; for Mrs. Jennynge, who is strongly suspected of having improved upon the less aristocratic patronymic of Jennings, shows the innate vulgarity of the *parvenus* in a hundred ways. We should be more inclined to pity her

daughter, who is keenly alive to her mother's deficiencies, were it not that that over-dressed young woman has so many foibles besides her affectations. Ready enough to remark these are two young men, whom Miss Jennynge might have tried to fascinate, had it seemed better worth her while. One of them is a Mr. Felspar, a successful portrait-painter, who might have made a handsome income by portraits and "pot-boiling," had he not possessed talents for higher things; while Walter Vernon, his inseparable friend, has hitherto been occupied in failing in literature. The friends, of whom we are destined to see a great deal, when their fortunes come to blend themselves with those of the heroine, are singularly favourable specimens of the best class of Bohemians, and Mr. Payn has expended no little trouble on them. Although they are almost aggressively indifferent to the conventionalities, they have a scrupulous sense of honour, and Felspar at least is capable of sublime self-sacrifice. But even while enlivening us in his merriest vein, Mr. Payn delights in touching deep chords of feeling; and, if he presents estimable people in a ludicrous light, he is pretty sure to make atonement sooner or later. Thus the placid Professor Armytage musters courage to override his imperious wife, when he sees an opportunity of doing an act of generosity; and we have a homely Devonshire couple, a Mr. and Mrs. Wallace, who shame their so-called betters by their natural refinement when it is a question of gracefully succouring the friendless. As for Mr. Aird, the wealthy Anglo-Indian, who treasures the memories of a melancholy past in the person of his sickly boy, we have always suspected that any asperities in his manner can only be skin-deep. Nor are we in the least surprised when, at the crisis of the story, he appears as a benevolent *doux ex machina* to assure the happiness of a pair of desponding lovers.

The most objectionable person in the novel, from a moral point of view, is the father of the engaging heroine—the scrubby thorn that has produced that grape with its luscious sweetness and its mellow flavour. It is a grape, by the way, that hangs above the reach of many gentlemen who sigh and long for it; and yet none of them, when they see it likely to be plucked by another, dare in their conscience to call it sour. As for the Honourable Mr. Joscelyn, personally we rather like him. It is very true that he is the incarnation of selfishness; we hear that he has behaved badly to his wife, and we know that he leaves his daughter penniless. But his powers of courteous self-command are equal to his capacities for self-indulgence, and though his monologues are generally pregnant with cynicism, he can make himself the most agreeable of companions. We make large allowances for the veteran man of the world who succumbs to luxurious habits which have been growing stronger and stronger; for his conscience is crumpling the rose leaves he would lie upon, and he makes honest efforts towards atonement according to his lights. Mr. Joscelyn not only manoeuvres with astute diplomacy to marry his fair young daughter to the valetudinarian nabob, whom he believes to be a worthy man at bottom, but he is ready to throw himself away on the vulgar Mrs. Jennynge, with the idea of securing a dowry for his child. And though he values money, yet he realizes full well the price he will have to pay for Mrs. Jennynge's wealth. But he is aware that he has the seeds of a mortal disease which will carry him off suddenly, and probably soon; so he hopes to console himself through the troubles of his few remaining days with the thought that he has done tardy justice to his daughter. Of course death comes to upset one of his most unselfish calculations, otherwise the novel would never have been written. It is much to his credit that Ella mourns him sincerely, for, as the young lady is as sensible as she is warm-hearted, it proves that his behaviour to her had blinded her to his faults. The orphan is thrown upon the assistance, and almost upon the charity, of strangers, and then it is that the real interest of the novel begins. Her father, in his anxiety to assure her future, has shown himself short-sighted when he meant to be worldly-wise. It might be all very well to save her from the impulsive devotion of Vernon, who would naturally have welcomed the destitution of the beautiful orphan as affording a magnificent occasion for demonstrating his disinterestedness. And as Vernon had pledged his word to her father that he would never propose unless he had an income of 1,000*l.* per annum to offer, he withdraws in the meantime into the background. But the intentions Mr. Joscelyn entertained with regard to Mr. Aird have unhappily reached the ears of the orphan, and raised an insuperable wall between her and one who would willingly have been a munificent benefactor. Nevertheless Ella Joscelyn, though left alone in the world, is neither helpless nor friendless. To say nothing of sundry suitors, more or less eligible, who are ready to marry her on the slightest encouragement, she has won the heart of the homely Mrs. Wallace, who is only too eager to adopt her. And Mrs. Wallace is bitterly disappointed when an aunt of Ella's appears to offer the girl an asylum. In her new home she is presented to a gentleman who is even more original than any of those she had made acquaintance with at the Ultramarine Hotel. Mr. Charles Edward, the master of the sumptuous establishment which her aunt superintends as lady-housekeeper, believes himself to be the legitimate descendant and representative of the illustrious line of Stewart. He exacts or accepts royal honours from the small circle in attendance on his person; and though he inherits all the stupidity of the last of his race, he is an honourable, kindly, and well-meaning gentleman. Moreover, there is no deception about his riches, whatever may be the case as to his royal pretensions; so, when he condescends to make the Honourable Miss Joscelyn an offer, she might

\* *A Grape from a Thorn*. By James Payn. London: Smith, Elder, & Co. 1881.

well have been flattered, as well as tempted. The only result, however, is a courteous refusal; which compels her again to shift her quarters. She is rewarded for her sacrifices and her patient waiting by being united at last to the man of her heart; and Vernon, who has been enriched by the will of Mr. Aird, prepares an agreeable surprise for his ladylove.

Our hasty sketch of the story may have suggested an idea of its scenes and episodes. Mr. Payn exhibits his command of the pathetic, as well as his knowledge of human nature, when he sets Miss Jocelyn to nurse Mr. Aird's invalid boy. Little Davey has been struck down by a contagious fever; and his attendants, while running a certain danger, are condemned to an irksome quarantine. It is natural enough that Ella, who loves the child, should only listen to the generous promptings of her affection; but Ella's father must be consulted by way of preliminary, and we know that Mr. Jocelyn is selfish. He would be loth in any case to be parted from his attentive companion; but, to do him justice, he is also alarmed for Ella. So he actually makes his calculations rather from her point of view than from his own. She may catch the fever, no doubt; but there are long odds against that. On the other hand, if she should escape infection, she will certainly win Mr. Aird's eternal gratitude, and so the scheme he has so nearly at heart will be forwarded. And Ella, in blissful unconsciousness, goes about her duties of mercy, with the results on which her father had confidently reckoned, though she reaches the goal of her happiness by a different road. It is in touches like these that Mr. Payn shows the forethought with which he contrives unsuspected intricacies in his plots. For the parts of the plot fall so simply and naturally into their places, that unless we submit them to critical examination, we overlook the care with which they have been planned. Then there is a good deal of interesting byplay when Ella, who has a pretty talent for drawing, is endeavouring to get an honest livelihood by illustrating books and periodicals. And these artistic efforts of hers offer great opportunities to her pair of artist lovers. For Felspar is at least as much in love as Vernon, and we suspect that, as his nature is far deeper and more earnest, the wound in his affections may never be healed. But, like the Spartan boy, he hides his grief under smiles, although we are conscious all the time that it must be gnawing at his vitals; and the resolution with which he nerves himself to apparent indifference is one of the happiest conceptions in an exceedingly clever novel.

#### MASSON'S DE QUINCEY.\*

AS we differ greatly from the estimate that Professor Masson has formed of De Quincey, both as a man and a writer, we are the more ready to allow that in his little book there is much that is interesting and instructive. At the same time we most heartily wish that it were clear of those faults of style which disfigure so many of the authors of this age. It is astonishing that a man who is so deeply read as Professor Masson in the great English classics should ever be tempted to desert them, and to pass over to the standards of writers who, at their best, are but a set of base imitators. In everything that he writes he has a meaning; for he is incapable, we feel sure, of finding such satisfaction in a mere jingle of fine words as to take no thought for the sense. Nevertheless, we cannot always see that his language can be strictly interpreted. Sometimes, indeed, it is too colloquial. Thus he describes De Quincey's father as "a rather interesting man." Of a little book he says:—"The performance is altogether very creditable." In writing about the effect produced on De Quincey by the story of Aladdin he writes:—"It was a revelation of the universal connexions of things which gave rise to no end of pondering." This over-familiar style is more than counterbalanced by such passages as the following—"over whose mountains the snow had come and gone silently for a thousand winters, and whose valleys had laughed again in equal privacy into shower and sunshine"; "Wilson's magnificent physique and his unapproachable applications of it in pugilistic matches"; and his "promises of some unusual form of literary effulgence not yet distinctly featured." What, we may well ask, is the unapproachable application of a physique when it comes to fisticuffs? If one man hits another in the eye or on the nose, that might, perhaps, be called the application of his physique; but then, on the very supposition, it is not an unapproachable application. In what other sense our author may perchance use "unapproachable" it is not our business to inquire. What, we may also ask, is not yet distinctly featured? We suppose that it is neither promises nor effulgence, but only the form of effulgence. Yet the featured form of effulgence has a very strange sound to our ears. In another passage he writes of "De Quincey's discovery of the omnipresence of . . . wisery . . . on the skirts of smiling society or actually within its bosom." He is as ill-judged in thus limiting omnipresence by society's skirts, even with its bosom thrown in, as he is in telling us that Edinburgh had a wealth of interesting traditions from the past; as if traditions came from the present or the future. A few lines lower down we read that "an unusual number of persons of greater or less note individually moved among her 130,000 inhabitants." He might quite as well have said that an unusual number of individuals personally moved. After describing some of his hero's "general characteristics,"

he thus begins a fresh paragraph:—"It is an important advance to be able to add that De Quincey's writings . . . are all, or almost all, of high quality." What is this advance that is so important? Nothing but the power that the author has of making a certain addition to his statements. In introducing an extract from the *Suspiria* he writes:—"It is perhaps the highest and finest thing, and also the most constitutionally significant, in all De Quincey. Fortunately, the essential core of it can be quoted entire." It is not easy to think of any core that is not essential, for though some animals have many stomachs, none, we believe, have more hearts than one; and this one they most certainly cannot do without. But, passing this over, what strange terms are these that we find in one who sits in judgment on the style of an author, and who tells those who will not fall down and worship the image he has set up that they are deficient in wing and sinew. The essential core of the most constitutionally significant thing in all De Quincey can be quoted entire! If these are the worst errors in language that we can bring against Professor Masson, the reader who is steeped in modern literature may be surprised not only at our censuring them, but even at our discovering them. Had they been met with in a young author fresh from the University, whose reading of the ancients ends with Juvenal and Tacitus, and whose modern reading begins with Mr. Froude and Mr. Swinburne, we should have complimented him on his moderation. But Professor Masson, as we have said, has been trained in another school, and must therefore be held to a stricter account.

We shall not attempt in the narrow space that we have at our disposal to follow him through his general estimate of De Quincey. We must content ourselves with dwelling on one or two points alone. Those who have read Mr. Carlyle's *Reminiscences*—who are they who have not?—will not have forgotten Southey's outburst of passion on the question that Carlyle put to him:—"Do you know De Quincey?" "Yes, sir," said Southey, with extraordinary animosity, "and, if you have opportunity, I'll thank you to tell him he is one of the greatest scoundrels living!" . . . His face, as I looked at it, was become of slate colour, the eyes glancing, the attitude rigid, the figure altogether a picture of Rhadamanthine rage—that is, rage conscious to itself of being just. He doubtless felt I would expect some explanation from him. 'I have told Hartley Coleridge,' said he, 'that he ought to take a strong cudgel, proceed straight to Edinburgh, and give De Quincey, publicly in the streets there, a sound beating—as a calumniator, cowardly spy, traitor, base betrayer of the hospitable social hearth for one thing!'" Southey's anger had been raised—most justly raised, we hold—by the "Sketches of Life and Manners from the Autobiography of an English Opium-Eater" that were then coming out in *Tait's Magazine*:—

No portions of the series [writes Professor Masson] attracted greater attention at the time, or excited more wrath in certain quarters, than the digressions upon the recently dead Coleridge and the still living Wordsworth and Southey. Carlyle has told us how Southey in particular, when he first met him, flamed up on the mention of De Quincey's name, averring that it would be but a proper service to good manners if some one were to go to Edinburgh and thrash the little wretch; and we hear elsewhere of the offence taken also by the Wordsworths and by members of the Coleridge family. Yet, as Carlyle seems to have thought, the complaints were excessive. The amount of personal gossip in the papers was much less than we have been accustomed to since; the "diversion," what little there was of it, was avowedly for scientific purposes; and no one could deny the generosity of the general estimates. The animosity expressed for Coleridge and Wordsworth all in all, indeed, went beyond what the world even then was willing to accord; and it may be doubted whether we have yet in our literature any more interesting accounts of the philosopher and the poet than those admiring, but sharp-sighted, papers. They and the rest of the articles in the same sense were, at all events, most acceptable when they appeared in the pages of *Tait*.

We cannot accept Professor Masson's apology for his hero; on the contrary, we deeply regret that such an apology should come from him. Is De Quincey to be excused because the amount of personal gossip that he wrote was much less than we have been accustomed to since? When a man is one of the first to break down those barriers that are set up for us all by regard for the feelings of others, by respect for the rights of hospitality and friendship, and by that other kind of respect which each must jealously maintain for his own character or else hopelessly fall away, it is a strange kind of doctrine that his guilt is lessened by the still greater excesses into which those have fallen who have followed in his steps. Was Scroggs after this fashion whitewashed by Jeffreys? That these papers were most acceptable when they appeared we can well believe. It is not often that a man gifted as De Quincey was gifted turns a public gossip, and basely and spitefully attacks those from whom he had received nothing but kindness. Professor Masson writes, "Yet, as Carlyle seems to have thought, the complaints were excessive." He forgets, however, that Carlyle states that he had read only one of the papers—that, namely, on Coleridge—and then adds, with a mark of interrogation, "Perhaps there had been other more criminal papers, which Southey knew of and not I?" We have little doubt that though Southey mentioned only the Sketch of Coleridge, his fierce anger was in part due to the far grosser treatment which Wordsworth, his wife, and his sister had experienced from the Opium-eater. With them De Quincey had at one time of his life been on terms of close friendship. "The mile of road," writes Professor Masson, "from his own cottage to Wordsworth's house of Allan Bank was his familiar walk morning and evening from the first, for the sake of Wordsworth's society and also of Coleridge's, so long as Coleridge remained

\* *De Quincey*. By David Masson. "English Men of Letters." Edited by John Morley. London: Macmillan & Co. 1881.

Wordsworth's guest." Through six or seven years this close intimacy lasted. One of Wordsworth's notes to him ends, "Most tenderly and lovingly, with heavy sorrow for you, my dear friend, I remain yours, W. Wordsworth." De Quincey moved to Edinburgh, and many years later published his Sketch of the household, in which he had once been treated almost as a brother. We admit that he is not sparing in his praises. Professor Masson is fully justified in writing that the admiration expressed for Wordsworth went beyond what the world even then was willing to accord. But because a man, each one of us might say, heaps praise on me which perhaps I do not want, is he justified therefore in holding up for the scoff of the world my failings, and, what is far worse, the failings of my wife and of my sister? Perhaps De Quincey in all this was acting merely from a kindness as sagacious as it was unusual. He, the foremost of Coleridge's admirers, as he claimed to be, had found out, he says, that that writer had stolen whole passages from out-of-the-way authors. He blazed his discovery abroad—among other reasons from his desire "to forestall other discoverers who would make a more unfriendly use of the discovery." "I felt," he adds, "that it would break the force of the discovery, as an unmitigated sort of police detection, if first of all it had been announced by one who, in the same breath, was professing an unshaken faith in Coleridge's philosophic power." Discoveries might, in like manner, be made about Wordsworth and his family, but the sagacious friend and the ardent admirer would once more forestall other discoverers, and by the vehemence of his admiration for the poet break the force of whatever failings might be found out in the man, the man's wife, or the man's sister. Professor Masson forgets that, though to "damn with faint praise" is not a bad mode of attack, yet to damn with strong praise is oftentimes a still better. A sneer and a slander more easily make their way when their rise can be traced, not to an open enemy, but to one who is avowedly, and even ostentatiously, a friend. Antony did not weaken the force of the blow that he meant to strike by his protestation that Brutus was an honourable man.

The value that Professor Masson sets on De Quincey's style is, in our opinion, far too high. It has, no doubt, one great merit; it is easy and clear. No one ever has to read a sentence twice in order to catch its meaning. But its ornaments are in excess, and its beauties are too artificial to attract for long. A little of De Quincey is pleasant enough; but a whole volume is much more than we can endure. He is likely to be enjoyed more by young men than by those who have reached middle age; and perhaps is read with most advantage by the students at our Universities. To them Professor Masson's little volume may render somewhat the same service as a guide renders to the youthful mountaineer. It will open to them a new, if a somewhat petty, land, in which they may, with some advantage to themselves, make a few brief explorations.

#### DRAMATIC SINGING.\*

THE condition of the opera in England has for some time been one of the most curious phenomena of modern society. Plutocraicism has obtained almost complete possession of the reins, and the result is a species of entertainment which cannot be called either genuinely artistic, dramatic, or musical. The repertory consists chiefly of a dull round of constantly recurring works of that kind in which the shallow fussiness of conventional finales takes the place of genuine dramatic climax, and the commonplace pompous display of theatrical pagantry that of genuine dramatic effect, in which the chorus singing is abominable, the acting uncertain and too often bad, the instrumentation generally poor and quite unworthy of the superb band which is called upon to perform it, and the language one which is sometimes unnatural to the play, often superfluous to the singer, and almost always incomprehensible to ninety per cent. of the audience. The set-off against these disadvantages is a string of seductive tunes and the singing of the most efficient vocalizers to be found in the circumference of the globe.

For these advantages people continue, not only year after year, but decade after decade, to pay simply preposterous prices. Many do so just because the prices are preposterous; some because they would not be in complete comfort in the circle of their acquaintances if the source of chit-chat based on a common apparent interest was to fall short; and some because it is a polite entertainment, and where the upper ten have gone before the next fifty will gladly follow after. So the forces of habit, levity, and vanity all conspire to support the rottenness of this branch of theatrical development, and to suppress any earnest attempt at improvement. In fact, the deterioration of substance has gone on so long that it is beyond the power of the most astute caterer for public improvement to patch it. The whole raiment has got too old and worn, and the ostensibly new pieces of *Lohengrin*, *The Flying Dutchman*, *Carmen*, *Mefistofele*, *Il Demonio*, and other less valuable fabrics, which are let in, have only a tendency to make the whole fly to pieces. Most publics do by degrees get tired of the fruits of their own foolishness; and, as this form of edification has had a very long spell, it seems likely that its day is not far from ending, and that an entirely new departure will be adopted.

This appears to be a sad prospect for the only portion of the operatic *habitués* for whom a considerate person will feel a touch of sympathy. There is amongst the inane crowd a group, of diminishing numbers, who take a genuine and intelligent delight in the art of singing, and understand and feel real emotional pleasure of a refined order from its highest manifestations. For these the class of works which have so long had almost complete possession of the boards have one decisive recommendation—in their perfect suitability to the style of a particular school of singers. This school has developed in the course of centuries, by tradition, observation, cultivation, and some reasoning, an elaborate system of vocalization, which admits of almost infinite shades and degrees of perfection in its application. The born singing creature is not a common product; but, when it appears, it has a tendency to be very much before the public; and, as the genuine gift of song is the one of all others which commands the souls of the masses and the purses of the wealthy, there has been plenty of incentive as well as fair opportunity for people to take note of the elements which produce so remarkable a result. In the development of this partly artificial system the field has been narrowed by the tendency of the born singing creature to spring from one part of Europe, and to sing one language, from which such generalizations as were attempted were inevitably drawn. As if to restrict matters yet further, a particular school of opera writers grew up which played in and in with the singers, and considered vocalization and vocal effect before everything else, and to the derogation of everything else. In the early stages, before conventional ossification set in, this resulted often enough in music which was the genuine result of musical feeling; and though the range of development could not be extensive on such terms, the perfect adaptation of the compositions to the requirements of the singers produced works of art capable of being a source of long-continued and refined, if not very deep-seated, enjoyment.

A desire to rouse a wider and more intelligent appreciation of this particular kind of musical enjoyment appears to have led one who evidently belongs to the most reasonable and cultivated class of *habitués* of modern opera to publish a simple analysis of the aspects and elements of what he calls dramatic singing. In this attempt everything but the singing element is to be carefully excluded, and the several attributes and elements of that portion of the art alone are to be quantitatively estimated. In setting out, the writer endeavours to forestall the possible charge of hyper-criticism, by protesting that, though he may, by the unwise, be "contemptuously likened to the critic who measured the merits of Garrick's soliloquy with his stop-watch," "the habitual analysis of vocal data need not lead to ridiculous severity in critical examination." This is obviously quite beside the point; for it is not the "ridiculous severity" of such a plan which is objectionable, but its complete inapplicability. However, the writer, in the course of his work, carries sufficient sympathy with him to prove that personally his objects and his enjoyments are alike free from the taint of pedantry; but he cannot, unfortunately, be freed from the charge of helping others to what he escapes himself. The art of music is at present in a peculiarly uncomfortable and unhappy stage of analysis. Mathematicians have begun to find music a pleasant field for interesting and often futile calculations; philosophers for the development of hazardous hypotheses; and a few writers, who are not philosophers, for the building up of reputations for wisdom on the shadowy foundation of public innocence. Consequently, it is easy and natural for people to pick up all sorts of elementary theories and a few facts, and thereby to make a show of refinement and cultivation by criticizing works of art and artistic performances from a ridiculously trivial point of view. This is, no doubt, a necessary stage in public education, as it is in the development of individuals; but it is not a happy one, and works which supply them with matters whose very nature suggests misapplication can do little more than lead them further astray.

The outline of the system proposed is as follows. The essential vocal attributes are first divided into compass, volume, sustained power, equality of power throughout the entire vocal range, quality, tellingsness, certainty, and freshness. Each of these is discussed separately, and a little incidental information is put in on any interesting facts connected with them, and then taking zero to represent average powers, plus and minus numbers are given to express the amount of relative value of each "essential attribute" in the sum total. Vocalization is then dealt with in the same way, dividing it off into intonation, time or rhythm, production of voice or articulation, flexibility or fluency, transition from chest voice to falsetto, and vocal style or embellishment. Finally, the elements of dramatic expression are divided into the just adaptation of style to the nature of the sentiment signified, the adaptation of style to the character portrayed, and the appropriateness of delivery to the national style of music. The first in this last division is a very important point indeed, and practically includes the second; and they, taken together and formulated with a little more breadth and comprehensiveness, might well make a subject for a valuable and interesting work a good deal larger than the entire volume under consideration. But here the means taken for bringing the matter home to the reader are chiefly the quoting of a number of "vocalizing feats," examples of drinking songs, tender songs, and love songs, from works such as *Marta*, *Norma*, *Gazza Ladra*, *Traviata*, *Lurline*, *Trovatore*, *Faustina*, and a few of better stamp, and possibly some of the opposite, and leaving the anxious student to apply his plus and

\* *Dramatic Singing, Physiologically Estimated.* By Walter Hayle Walsh, M.D. London: Kegan Paul, Trench, & Co.

minus numbers according to the lights of his own helplessness. The sum total of the theory is, that dramatic singing may be divided off into seventeen attributes, to which different numerical values may be assigned in supposed conformity with their relative importance; the entire collection, amounting to +172 for supreme efficiency in every department, and -171 for the supreme reverse. At the outset this appears a serious matter for the critic of musical dramatic performances; and the only outlook which appears possible for people of earnest disposition is to give up librettos or scores, and take with them to the opera a slate, or some well and widely ruled foolscap paper with the names of the performers written conveniently; and as they successively go through their allotted task, jot down, with a view to striking a fair average, the amount of plus and minus attributable to the singers' respective capacities or incapacities, with a distinct recollection that each attribute is relative to sixteen others, to all of which numbers varying in amount have been assigned. The opera-goer will also have to consider further that no singer ever sang at quite the same level every night, and that one part of the same performance may be languid, and another at a strong pitch of dramatic vigour. But it is hardly possible that half a dozen critics all present at fifty performances of half a dozen identical singers would be able to agree at the end on the amounts to be assigned for each attribute to each singer, and if they could, it is difficult to see what they would gain by it. An impresario would not engage an artist chosen on such terms, and a musician asked to accept a judgment so arrived at would probably shrug his shoulders. The impracticability of the scheme is manifest on other grounds. It emphasizes the singing part of the performance beyond its due measure. It treats the matter in a form which few of the class who frequent the particular kind of entertainment as at present constituted are likely to trouble themselves with, while people who are seriously inclined will either find it too elementary and superficial, or think that the assigning of numerical equivalents is quite as open to disagreement in detail as unassisted personal feeling is in general. Moreover, if the book is really intended "for persons devoid of musical education" to enable them "to determine the mechanism and gauge the justness of effects agreeable or the reverse produced on their emotion and intellect by the music declaimed or sung," it must be answered that the treatment of the various points is not full enough, or particular enough, to enable them to make just estimate of the points to be considered, and could not be made effective in anything like the limits given. And, lastly, the most vital point of all is really left almost untouched. The highest achievements of dramatic singing come from the indefinable power of the rare ideal artist, gifted with soul, intelligence, penetration, and nervous force, who has the supreme gift to realize emotionally the highest dramatic purpose of the composer and the poet, and so to balance the situations of the drama in their relative prominence and importance in the unfolding of the story, and to vary the force of accent and the relation of phrase in the declamation at the most prominent crises in the action, as to make the hearer feel them in his own person. These are things to which the attributes discussed in the book are of secondary importance, and the idea of assigning to them numerical values in relative proportion seems preposterous. The other attributes must be present in due proportion almost as a *sine quâ non*; and if they are, it is quite superfluous to give them such minute attention in any genuine artistic performance, while if they are not, the matter is superfluous altogether. For the rest, the writer is clearly highly cultivated in various directions, experienced in matters concerning the art of singing, and familiar with Messrs. Helmholtz, Herbert Spencer, Darwin, and the classics; and, while possessed of wonderful capacity for the appreciation of what is good, rather indiscriminate both in his admiration and in his choice of test examples. The book does, as before observed, arouse sympathy not a little, especially in parts which deal with things generally and without assigning numerical equivalents. The description of sensations derived from a first hearing of the *Vorspiel of Lohengrin* is interesting, and so also are some words upon the relation between the speculations of mathematicians and the inspiration of composers. In some places the writer seems almost to call up evidence against himself, as when he quotes, with reference to the power of singers over their audience, "Si vis me flere, primum dolendum est tibi." To this a numerical equivalent might be theoretically, but scarcely practically, applied. In another place he says, "The intellect in truth plays a governing part in the proper delivery of emotional song the same in essence as, though less in degree than, in the inventions of the composer." For this and some correlative matters there appear to be no numerical values assigned.

There are many remarks and criticisms which are just in conception and clear in statement, and it seems probable that, if the space given to the consideration of numerical equivalents had been occupied by more of the same calibre, the work as a whole would have been of more general value, as well as of more attractive quality.

#### A YEAR IN FIJI.\*

MR. HORNE'S book is something as little as possible like ordinary accounts of new countries, or a new account of

an old one which some fluent writer feels called upon to describe again. *A Year in Fiji* is not full of Mr. Horne's personal adventures, his house, his dog, and his servants, to the exclusion of anything like solid information about the country. On the contrary, the writer has been so entirely intent on collecting and then conveying the most useful information of all kinds, that the readableness of his book has considerably suffered. He probably never intended it for light reading. His object in visiting Fiji was a strictly practical one. In 1877 Mr. Horne was invited by Sir Arthur Gordon to visit the islands, not, as it would seem, for the express purpose of making a report of any kind, but doubtless with hopes on the part of the Governor that something of the sort would come of it. Mr. Horne had been Director of Woods and Forests in Mauritius for sixteen years, and was then about to return home on leave with a sort of commission from the Chamber of Agriculture "to select and forward whatever new and suitable specimens of canes he could find in the different islands lying on his route." For this purpose a visit to Fiji could not fail to be very useful, and Mr. Horne spent the year there, of which this book gives the results. He obviously availed himself of his opportunities in a most conscientious manner. The island of Ovalau was his starting-point, and he continually returned to it for fresh departures. The very clear map which is prefixed to the book is covered with red lines marking the journeys of Mr. Horne; and they cover the whole archipelago like a spider's web, with its centre at Ovalau. Of course, as a friend of the Governor, the author travelled with every assistance, and had every opportunity of seeing the people and the country. We hope to be able to show that Mr. Horne has used these opportunities so as to make a most useful book; but unfortunately it is, as we have already hinted, not very light reading. The author goes straight ahead, taking everything as it turned up, and giving copious information about it, but all a little too much in the style of an official report. It would be hard to put a question as to the products and capabilities of the Fijian Archipelago to which Mr. Horne has not supplied an answer; but we cannot promise readers who like their intellectual food to be carefully sweetened for them much pleasure out of *A Year in Fiji*. To be sure, the author may reply that it is not his business to be amusing, but to supply Government officials, traders, and colonists with information likely to be useful to them, and that more amusing writers may be trusted to draw on his stores. Nevertheless, some attention to the graces, particularly a little more symmetry, would not have hurt the solid qualities of Mr. Horne's book in any way.

Of the natural capabilities of this the last-acquired of our possessions—now that the Transvaal has ceased to hold that position—Mr. Horne gives a very favourable account. He repeatedly mentions finding tracts of land well fitted for growing sugar, coffee, or cotton, and his summing up of the qualities of the soil is that it is very productive. Trading missionaries, "beach-combers," and cannibal savages are none of them very agreeable or useful persons; but we may be grateful to them for the possession of Fiji. It was almost wholly due to their combined exertions for the production of mischief that the Archipelago fell into our hands. The islands have not only a fertile soil and a variety of useful productions, but are well supplied with deep-water harbours, which are likely to be equally a source of wealth. One place in particular—Savu-Savu, in the island of Vanua Levu—seems to be an almost ideal spot for the construction of a great trading port. It has even got a mangrove swamp joining the two islands in the bay, "probably the crater of an extinct volcano," which looks as if it had been expressly intended for a dry dock. Even the climate of Fiji is admirable, in spite of its tropical character. Malarial fevers and other diseases common in nearly all tropical countries are almost unknown. The sufferings of new comers, who are said to be subject to dysentery, are attributed by Mr. Horne to change of diet and "careless living," which, having regard to the character of most of the new comers up to a very recent date, is probably a gentle way of indicating the excessive use of strong drinks. The diseases of the natives, of which elephantiasis seems to be the most common, are probably the result of dirty habits, and perhaps an inheritance from the old times of cannibalism. To be sure even Fiji has drawbacks to its climate, at least for white settlers. European workmen can work in the open air all the year round, which is a rare thing in a tropical climate; but that, unfortunately, only means that they can do so if able to display the necessary energy; and for nearly half the year the effort is more than can be expected of any white man. It is not very easy to see how anybody can be expected to work from October to May when "the least exertion brings the perspiration in streams out of the body," and "the least amount of clothing is burdensome and oppressive." After all, the fine climate of Fiji is only fine in a tropical sense. A white workman is a little less likely to die there than elsewhere in the tropics. The labour of the islands will always have to be done by the natives.

As the old races of the archipelago, which do not seem to be dying out before the whites as the inhabitants of other islands in the Pacific are, will always remain indispensable to its prosperity, it is interesting to see what their character is, or is likely to become as modified by European influences. To judge from Mr. Horne's account, they are already very different from their well-established reputation for savagery and cannibalism. It is difficult to reconcile his picture with very recent stories of cruelty and fanaticism—acquired along with a taste for ardent spirits from the inferior kinds of missionaries—which have come

\* *A Year in Fiji; or, an Inquiry into the Botanical, Agricultural, and Economical Resources of the Colony.* By John Horne, F.L.S., &c. London: Eyre & Spottiswoode. 1881.

from thence. In all probability such stories have grown considerably on the journey. However that may be, the impression of the Fijians left by reading *A Year in Fiji* is that of a mild indolent race, exceptionally amenable to discipline, and open to the influences of civilization of a better kind than the vice of drunkenness and the habit of excitedly howling Methodist hymns. Mention is made of old hill forts now become useless, or utilized as police stations, since the English rule put a stop to the murderous tribal wars. We hear also of marauders from the hills who raided on the settlements, and whom the colonists guarded against by the fatal expedient of cutting down the woods which gave them shelter. These raids have apparently come to an end, which is unfortunately far from being the case with the ill effects of the destruction of the forests. The races of the islands have loyally accepted the English rule; and Mr. Horne absolutely met a chief who even in these times was proud of being a Briton. Perhaps the author takes a rather discreetly favourable official view of the sentiments of the Fijians; but in the main his opinion that they are well satisfied with things as they are would appear to be well founded. The good sense of the English rulers, who interfere as little as possible with the native organization, has much to do with their contentment. And, indeed, that organization would seem to be admirably made to the hand of an intelligent governing power. Mr. Horne gives an interesting description of it, which has a curious resemblance to the primitive institutions of peoples much nearer home. The whole is based on the village or "Koro," with its chief, the Turaga ni Koro. Several villages are united under a Bali, and these again are united into circles under a chief or Iko Tui. The English Governor has taken the place of the king over all. The village chief is assisted by a council, the chiefs of districts hold monthly meetings, and the greater chiefs, with two Balis chosen from each province, and the native stipendiary magistrates, meet the Governor yearly in the great council, Bosevaka Turaga, to discuss national affairs in a parliamentary way. The whole reads, allowing for the difference of the names, like some passage from Dr. Stubbs on the early constitution of a Teutonic nation. The likeness is made more obvious by the fact that the various native offices are hereditary in certain families, from which the immediate holders are elected by the village or district council. The people whom Mr. Horne met seem all to have been kindly and well disposed, a disposition which was probably partly due to the fact that he carried strong letters of recommendation from the Governor. On one occasion, at Vuni Savani, he found himself likely to be stopped for want of bearers, the men of the village being absent at some work and not likely to return for days; but the women, "to show that their town should not be wanting in the accustomed hospitality to strangers," took their place, and were grateful at the end of the journey for a small present of tobacco. Heathenism is dead, or at least has sunk out of sight. The chiefs are eager to get education for their children, and he of Loma-Loma has advanced to such a high point of civilization as to have established a respectable botanical garden. Even the savage Tonguese are becoming tamed. All the inhabitants of the islands are good sailors, and give plenty of employment to the boat-builders. On the subject of the white settlers Mr. Horne is sparing of comment. He says enough, however, to show that the old boach-comber and vagabond element, which has been the pest of the Pacific Islands, is still too strong in Fiji. Time and the strong hand of English government will probably weed the class out in a generation or so, if they will not be drilled into some degree of usefulness. The advantages which the cultivation of different tropical produce offers to capital is already attracting a better class of settlers.

A Director of Woods and Forests has naturally a great deal to say on the subject of the forests of Fiji. Several passages of Mr. Horne's book, and nearly all the ~~the~~ appendices, are devoted to the past treatment of the trees of the islands and the steps to be taken in the future to prevent their total disappearance. It would seem to be the case with our rule everywhere, from the middle of the Pacific to the end of the Mediterranean, that, as soon as we have stopped the natives from cutting one another's throats, we have to stop them from cutting down the trees. Fiji is no exception to the rule. The natives are wasteful and careless, and, though the vegetation is rapid in the tropical climate, the more valuable trees tend to disappear. The white traders have been almost criminally reckless, particularly as regards the sandalwood. This noble tree has been so stupidly wasted by the old traders of semi-piratical renown that it will now have to be restored by careful Government superintendence. The process will be a long one, as the tree requires from sixty to seventy years to come to maturity. It is satisfactory to see that the Governor has employed Mr. Horne to draw up a scheme for the re-wooding of the islands, which will probably produce the desired effect, and not the less effectually that it provides for interesting the natives in the results. Besides sandalwood, the islands produce more than twenty different kinds of useful timber, all of which Government is taking care to foster. It is also exerting itself to instruct the natives and the more ignorant settlers in better methods of cultivation. Altogether, Mr. Horne's book shows that, if Fiji is only severely let alone by philanthropists and reformers for another half-century, it will become a very valuable possession, and produce coffee, cotton, sugar, and so forth, to a very respectable figure of millions.

## AUSTIN'S SAVONAROLA.\*

MR. AUSTIN tells us in his preface that he formed the idea of writing a tragedy on the subject of Savonarola seventeen years ago. Haste, therefore, cannot be pleaded in extenuation of any of the shortcomings which we may find in it. Further, the author insists that the true drama is that which is written to be acted, and which is to be judged, "not by individuals sitting solitary in their closets, but by crowds assembled in the theatre." Here, then, is a play written expressly for the stage by an author of distinction; and as a play suitable for representation it must stand or fall. That such is Mr. Austin's wish—we might almost say ambition—is clear from the concluding sentence of his preface:—

Whether *Savonarola* will ever be acted I know not. But, at the risk of being reproached with presumption, I will confess that I wrote with the intention, nay, the hope, of proffering it as a humble contribution to the dignity of the English stage. I may share the regret, which others will doubtless entertain, that the task did not fall into worthier hands. But I have at least endeavoured to accommodate myself to the legitimate demands of the existing theatre, and, as far as in me lies, to lessen that estrangement between literature and the stage which I am surely not alone in thinking is a reproach and a detriment to both.

We fully agree with Mr. Austin in regretting that so few literary men write for the stage nowadays, and that fewer still succeed in getting their plays represented. This, however, is, to a great extent, their own fault. The difficulty of persuading a manager to accept a new piece by a new writer has become almost a commonplace. Nor is it to be wondered at that a man of business—for the management of a theatre is, after all, as much a matter of business as the conduct of any other commercial enterprise—should hesitate for a long while before risking his capital. And yet aspirants for dramatic fame persist in increasing this difficulty by presenting works of such a character that nobody except the sovereign of a wealthy kingdom would dream of mounting them. Here, for instance, is a tragedy in five long acts, with a list of characters enumerating thirty-three speaking persons, besides a crowd of officers, citizens, soldiers, and monks of different orders, all of whom would have to be habited correctly, or not presented at all; for the author makes no secret of his desire to exhibit a series of pictures of life at Florence at one of the most interesting periods of her history. Again, scenes such as the "Burning of the Vanities" in the Piazza del Signoria, with the subsequent condemnation of the conspirators who have been plotting the return of the Medici, the attack on the convent of San Marco, and the final execution of Savonarola, would tax the resources of the largest and best appointed stage in Europe. And this brings us to another point. The writing of a play is, to a certain extent, like the painting of a picture. It requires technical knowledge. Artists spend years in trying to acquire this knowledge; and until it has been acquired they do not presume to exhibit their works to the public. Writers for the stage, on the contrary, sometimes appear to think that this knowledge may be dispensed with. We have heard amateur actors cut short a tedious rehearsal with the consoling reflection, "It will all come right at night"; and some of our modern dramatic writers act in a very similar fashion. They do not study either the methods by which their conceptions must be presented to the public, or the limits imposed by stage convention and stage necessity. From what Mr. Austin says in the passage which we have quoted above, we expected that we should have no fault to find with him on this score; and yet, in Act iv., the following scenes are directed to succeed each other. The act opens with the "Piazza del Duomo," which would require the whole depth of the stage; this is succeeded by "A Street in Florence," which is evidently not what is called in theatrical phrase a "carpenters' scene," for the houses are "practicable," with doors that open and shut, and window-shutters that are flung open to indicate afternoon, and crowds of people come and go; and, lastly, we are taken to the "Piazza of San Marco," another scene occupying the whole stage. We should like to know how Mr. Austin proposes to arrange these elaborate "sets" without wearying the audience by frequent falls of the curtain. We feel sure that authors are too prone to disregard the importance of the scenic arrangements which their works involve. This disregard, however, not seldom causes the refusal of their piece, which they attribute to the greed of a parsimonious manager, while it is really due to their own ignorance of what is as indispensable for a play as a knowledge of colour and composition is for a picture.

There are, however, other considerations which, we fear, will militate against the favourable reception of *Savonarola* as an acted play. A play to be successful on the stage must above all be interesting. As the elder Dumas cleverly puts it, "Premier acte clair, cinquième acte court, et de l'intérêt partout." In other words, the interest of the audience must be excited at the outset, and then subdivided so dexterously that whenever the drop-curtain falls they may be left in suspense, eagerly waiting for it to rise again. An interesting story, however, is not all that is necessary; the characters, or at any rate the leading ones, must be sympathetic. Without this no elaboration of plot, no introduction of the element of suspense, no luxury of historic illustration, will save the piece from well-merited condemnation. Mr. Austin's play is, to our mind, neither interesting nor sympathetic. There is little or no story in it, and no single character would enlist the sympathy of an audience

\* *Savonarola*. A Tragedy. By Alfred Austin. London: Macmillan & Co. 1881.

for five minutes. The first act promises well. The opening scene with Lorenzo dei Medici, sound in mind but weak in body, striving to bear himself as usual towards his friends; the succeeding scene, where the Florentines are hoping for his accustomed presence at their carnival; and the last scene of the act, where he vainly appeals to Savonarola for his blessing, are all striking pictures; but they lead to nothing. Between the first and second acts Lorenzo dies; and Savonarola, though he appears in each succeeding act, excites only that distant sort of admiration which a spectator feels for a comet, or a meteor, or any other strange portent remote from the ordinary paths of humanity. We had hoped, from a few words spoken by Lorenzo in the first scene, that something was to be made of his betrothal of the fair Candida Donati to his friend Tornabuoni, whom she does not love; and of the contrast between his passion and the sober suit of Valori, whom she does love. These per-ouages have the required elements of interest and sympathy; but the author has let slip the opportunity of developing them, and has shown the lady in a somewhat odious and unnatural light, by making her practically responsible for Tornabuoni's death, when a word to Valori would have saved him from the scaffold. As for the other persons, they have so little individuality that we have been repeatedly compelled, while reading the play, to turn to the *dramatis personæ* in order to see whether they were partisans of the Medici, or Pignoni, or Arrabbiati. Spini, Salvisti, Capponi, all talk in the same language; and the speeches put into their mouths might be transposed without rendering the scenes in which they appear more obscure than the author has made them. He is at his best when putting before us some historic tableau, in no way connected with the feeble story which runs haltingly through his play. Such is the scene of the "Burning of the Vanities" in the third act, which is exceedingly dramatic and humorous. Unfortunately, however, it impedes the action, and therefore, when judged by the standard set up by Mr. Austin himself, must be unreservedly condemned. The speeches of Savonarola, again, considered merely as rhetorical declamation, are very good. Take for instance, his denunciation of the Florentines celebrating their carnival in front of the Duomo:—

What do you here, you pagan roysters,  
Roaring around the pillars of God's House  
Your lewd fantastic canticles? The Sword  
Hangs by a thread and is about to fall,  
To fall, ay, and on Florence. Put off quick  
Your carnal garments, and make haste to don  
The sackcloth of repentance, trills is all,  
That, Christians called, are worse than midell,  
Blasphemers, usurers, slaves to fleshly lusts,  
Mortgaged to Hell, whom Christ would fain redeem.  
Blessed are they that weep! you only laugh;  
Shameless as Sodom are ye, and as deaf,  
Seeing no star in the East! Accursed be  
Your obscene songs and foul frivolities!  
Accursed they that writ and they that sing,  
Accursed in their offspring and their doom!  
The Sword of the Lord is sharpened, and your necks  
Shall feel the smiting of its edge. How long,  
How long shall I implore you, Florentines?

These are vigorous verses, and did they bear in any way on the story, would produce a fine impression. The truth is that one capital defect underlies the whole play. Mr. Austin has made the common mistake of those who try their hand at historic drama; he has kept the real and the fictitious personages far too distinct. Historic events are generally interesting on the stage only in proportion to the influence which they exert on the persons of the author's own creating. It is rare to find events sufficiently dramatic in themselves to stand alone as the foundation of a play. If, however, the author is able to devise a plot involving antipathetic persons, whose fortunes are made or marred by historic events and historic persons, his work is pretty sure to be successful. Instances of this are rare on our own stage, though common enough elsewhere. Shakespeare's "Histories" illustrate our meaning to some extent, for they have lost their popularity precisely for the reason that there is too much history and too little fiction in them. The audiences of his day delighted to see events, not so very distant from their own time, represented just as they believed them to have happened, without addition or alteration. He, however, when treating a subject at a safe distance, like the reign of King John, allowed his fancy to invent, under the guise of history, some of the most pathetic scenes on the stage. In French dramatic literature there are many excellent examples of the mode of treatment that we have attempted to indicate. Take, for instance, Victor Hugo's *Lucrèce Borgia*, which we cite not because it is the ablest of his dramas, but because it is the one best known. He contrives to make his play intensely interesting without once violating probability. His heroine may never have had a son; but, on the given conditions, she might have had one; and, again, contemporary writers have given her numerous lovers. The plot, therefore, in which Victor Hugo involves her does not disturb our conception of the traditional *Lucrèce*, but only sets before us herself, and the time in which she lived, with terrible force and reality. In some such way, we think, Mr. Austin might have treated Savonarola; in other words, he might have shown him influencing, and influenced by, the personages of the plot, instead of remaining external to them. At any rate, such a mode of treatment would have given us realities, instead of a set of puppets.

#### THE DINGY HOUSE AT KENSINGTON.\*

IT was with some misgivings that we learnt from the preface that the first part of this novel, together with passages in the second and third parts, had been published in a magazine as early as 1872, whilst the rest now appears for the first time. Such a disjointed method of publication would naturally suggest a certain scrupulousness of treatment, and is, indeed, hardly consistent with the orderly and artistic development of a well-matured plot. We will say at once that our misgivings were, to a certain extent, justified. The work is somewhat scrappy, and the chief incident on which the story turns is both feeble and improbable; but, for all that, *The Dinky House at Kensington* is a very good novel. Moreover, good as it is, it gives promise of something better; the faults are those of inexperience, and will no doubt tend to disappear as the writer gains more knowledge of her craft, and are perhaps partly owing to the circumstances under which the book appears; whilst the merits are the rare ones of strong grasp of character, and, above all, of great sympathy with the humour and pathos of commonplace life; and these are qualities which are certainly more valuable to the novelist than the power of elaborating an ingenious plot.

We have assumed that the author is a woman, and this, indeed, is sufficiently obvious from the fact that the book essentially consists of the loves and sorrows of a very simple maiden, whose innocent thoughts and ways are described with a fullness of knowledge to which no masculine writer could pretend. It is in the portrayal of this simple maiden, and of her most dreary life, that the author shows her real strength. The sympathy is so vivid, the insight is so true, that Polly Dawson becomes a living figure, and fills the reader with the love and respect that a really good woman always inspires, even in the most hardened masculine bosom. Polly Dawson is the only daughter of a prosperous attorney, who, although really very well off, has acquired such a confirmed habit of screwing and pinching that he makes himself and his family perfectly miserable. This sleek and respectable miser is, after Polly, the best character in the story. The one affection of his life is for his sickly son; but so strong is the ruling passion that he cannot bring himself to afford those comforts and luxuries which would save his son's life. The struggle between affection and a habit which has become an irresistible instinct is very well described, and makes one forgive the excessive sweetness of the son, who is a mere puppet, strangely lacking in the vivid reality of most of the other figures. He is a kind of little Donkey grown bigger, and one assists at his funeral with a feeling that he was destined to end thus from the very beginning, and that he might have been rather quicker about it. Nemesis, however, overtakes the father in the shape of a second wife; his first one, who is rather a good character, having followed her son to the grave with commendable alacrity, more, apparently, because she was in the way of the development of the story than from any definite illness. Mr. Dawson, having thus obtained his liberty, makes use of it in the foolish manner that is common enough even in people who ought to know better. He falls in love with an extremely haughty and impecunious beauty, who is induced to marry him as an alternative to starvation. So blindly infatuated is he with his wife, who never conceals her contempt and aversion for him, that he actually almost launches out into extravagance on her account, and then flies to reckless speculation to satisfy his outraged love of money. This ends in the way that seems inevitable in novels. Mr. Dawson is ruined, and is found dead one morning in his study—whether he dies of suicide or of simple disappointment is not clearly stated. So Polly is left all alone in the world, as her stepmother immediately departs to the West Indies, and is heard of no more in the story.

It is one of the weak points of the plot that the father's misfortunes have nothing in particular to do with Polly's own peculiar troubles. The two stories pursue their way side by side, but have no influence one upon the other. It is true that Polly is left poor and lonely when her father dies; but then he never allowed her any money when he was alive, nor did he ever look after her in any way, so his death causes no alteration in her condition. So little had she been looked after that she had, without her father's knowledge, though quite innocently, struck up a violent friendship with a young gentleman who walks with her, lends her books, and improves her mind, and generally is her guide, philosopher, and friend. Of course she falls in love with this young gentleman, who eventually is so touched by the spectacle of her devotion that he actually proposes to her. In consequence, however, of one of the most irritating and impossible misunderstandings that we have ever met with in fiction, she breaks off the engagement, and at last, in her misery and loneliness, accepts a devoted lover who has proposed to her at odd moments from the beginning of the book. All this has happened before her father dies—an event which, as we mentioned before, has no influence one way or another upon her fortunes. Robert Welch, the persevering lover, is another well-drawn character. He is a most excellent young man, hard-working and intelligent in his business, and with a capacity for unselfish and chivalrous devotion which earns him the undying gratitude of Polly, together with many vows that she will devote her life to making him happy. But, in spite of all her gratitude, she cannot bear the thought of marrying him. She feels it is very wrong of her,

\* *The Dinky House at Kensington*. London and New York: Cassell, Petter, Galpin, & Co.

but she simply cannot stand his society when he is making love to her, and this he is always doing whenever he has the chance. For this terrible young man, in spite of all his goodness and chivalry, is one of the dullest and most prosaic of human beings; and Polly, to her cost, has derived from her countless walks and talks with her other lover a tinge of literature and an interest in high matters, which can find nothing to satisfy them in the artless conversation of Robert Welch. The mingled comedy and tragedy of this dreadfully real situation have been finely hit off by our author:—

She heard Robert's footstep; she knew it well enough. He ran up the steps blithely and quickly, let himself in with a latch-key, and hung up his hat in the hall, whistling all the time, while she listened keenly and curiously. Then he looked in on the chance of Polly's being in the parlour, and, seeing her, burst in, thin and sallow, with his coat, as usual, a size too large for him, his arms looking unnaturally long, and his kind, bony face, lighted up with good humour and satisfaction. "Oh, Polly!" he exclaimed, "have the old folks really gone? How nice you look!" and he rushed forward, and she tried not to feel like a martyr, and to think that it was all quite right and natural, and she ought to submit, and she would. "Oh, Polly!" he went on, in a tone of rapture, "look at the cloth laid just for us two. Doesn't it make you think—?"

"Yes, Robert," she said, dutifully. "You had better go and wash your hands," she added, in the practical manner that seldom failed her when she was with Robert.

"All right, darling;" but he lingered by the door, still looking with satisfaction at the dinner table. "I know what I'll do," he said, in the tone of one to whom a brilliant idea had suddenly occurred; "I'll put our two places close together. You shall sit here just round this corner;" and taking up the knife and fork that had been laid at the opposite end for Polly, he proceeded to place them. "And I'll move the table-spoons and salt-cellar, and then we can spoon between the courses."

"No, you mustn't," she said, desperately. "Do leave the things alone. What would Harriet think?"

Of course things come right in the end; the silly misunderstanding is cleared up, poor Robert Welch is thrown over, and the guide, philosopher, and friend condescends to put the finishing touch to Polly's education by marrying her himself. This noble conduct seems to quite make amends for the mean way in which he allowed what he must have known was a mistake to separate him from the girl to whom he had just proposed. Indeed, as he makes no effort to clear up the misunderstanding, or even to see his beloved, one can only suppose that he was rather glad to get out of the engagement. However, they get married at last, and live happily ever afterwards; poor Robert Welch being allowed the cold comfort of an occasional visit as a trusted friend.

Such is the simple story of Polly's life—a story in itself uneventful, commonplace indeed where it is not improbable, but still profoundly interesting in that it seems the story of a real woman, and of one that one cannot help loving. And of all the imagined uses of novels, there is none more incontestable than the good that is done by awakening sympathy with the fortunes and misfortunes of the ordinary human beings who surround us. There is an infinite pathos in the dreary and monotonous existences of average women; creatures sometimes foolish and sometimes ignorant, but often good with a goodness that seems beyond the power of men; and with a patient cheerfulness that is proof against all boredom, and a quiet courage that bears them safely through the tragedies of death and of disappointed love, which alone have power to stir the peaceful dulness of their days. Of such women Polly Dawson is a typical example. Raised somewhat above the average in intelligence by intercourse with a cultivated egotist, she pays for this superiority over her fellows by being unable to accept the common lot and to marry a worthy and stupid man to whom she can devote the accumulated goodness of a lifetime. That she is made happy in the end is, of course, a mere novelistic necessity. We ourselves have no doubt that the adored egotist forgot all about her and married somebody else, whilst she cheered a lonely old age by brooding over his manifold perfections.

In conclusion, we cannot too highly praise the healthy tone of the whole story. Although the drawing of the characters is both thorough and delicate, it is commendably free from that super-subtle analysis of hidden motives that makes many modern novels so indescribably tedious. The style is good throughout; simple, bright, and unaffected, and happily devoid of any pretence at "word-painting." It sounds incredible, but we do not recollect a single description of a sunset. Praise can no further go.

#### CHRISTMAS BOOKS.

IV.

WE cannot say that the Christmas books this year show any marked improvement on the taste of the past. The books for boys are perhaps rather more readable; for Mr. Henty, especially, has the art of making his stories "go"; and, if the pictures are no better, they are no worse than usual. The babies' books—the paper books for the nursery—are more numerous than ever; and Mr. Caldecott, Mr. Crane, and Miss Greenaway have set such good examples that the illustrations are greatly improved. If any Christmas books ever come to be collected and admired, and sold for vast prices at future sales, as old chapbooks sometimes are today, the nursery books will be not unlikely to survive. But the "table books" do not improve. They neither contain more literature than in the past, nor are they much less garishly covered (though here, perhaps, there are traces of improvement), nor are the pictures more worth looking at. Messrs. Bickers have published what might have been a really beautiful book, *The Pilgrim's Progress*, with copies of Stothard's illustrations. The size is handy;

the binding is stamped vellum, with a pleasant air of antiquity combined with cleanness. The type is clear and good, the paper very respectable, and with uncut edges; but—Stothard's prints are reproduced by photography, the ordinary brown, glossy photographs. Now Stothard's manner was quite out of keeping with the pseudo-antiquity of the stamped vellum, and glossy photographs are equally out of keeping with antiquity and with the manner of Stothard. Woodcuts like Bennett's in the old non-American style, with bold lines in black and white, would have been the fitting illustrations for this volume. If Stothard's inventions were to be used (and none can be more gracefully pretty), one of the new methods of reproduction in facsimile should have been employed. These considerations will not probably prevent this handsome and incongruous volume from being popular. But the new *Pilgrim's Progress* shows how shaky and fallible is modern taste in decorating books, after all the attempts that have been made to lighten the darkness of publishers.

*The Tyne and its Tributaries* (W. T. Palmer. Bell and Sons).—Mr. Palmer is responsible both for the literature—not "letterpress"—and for the woodcuts of this beautiful volume with a worthy subject. Among the woodcuts we may notice a very mutilated "Supposed Roman Sculpture of Iliwer God of North Tyne." The Tyne's northerly springs are in Roxburghshire, over the border. The same marsh gives birth to Tyne, flowing south, and Liddel, flowing through northern Liddesdale. Mr. Palmer gives a most characteristic engraving of the "dour" Presbyterian scenery, black hill and sour flats in which Tyne has its source. Mr. Palmer has some by no means familiar stories of the old Borderers who stocked their farms with sword and spear. The Robsons, a clan still powerful near the scene of the Raid of the Redswire, once rather hastily stole a flock of scabbed sheep from the Grahams. Justly indignant, they made another raid, and caught seven Grahams, whom they hanged, to encourage the others, and warned them "next time gentlemen came to take their sheep, they were no to be scabbit." But here we are only at the beginning of a book full of fascination for all Borderers, and all lovers of rivers. We earnestly commend Mr. Palmer's volume to the people of the North, and to all anglers and amateurs of ballads. Some day, we hope, he will illustrate Tweed, a subject more magnificent than even Tyne. This is much too good and permanently valuable a book to be forgotten in the crowd of Christmas novelties.

*Living Painters of France and England* (Remington and Librairie de l'Art).—The etchings in this handsome volume have already appeared in *L'Art*. Here is Mr. Millais's "Yeoman of the Guard" (Waltner) and Mongin's "Lecture chez Diderot," after M. Meissonier. Mr. Macheth etches his own "Landing Sardines." There are twelve other etchings of favourite modern pictures, and some pages of letterpress.

T. Pym's *Outlines for the Little Ones to Colour* is a series of pretty outline-drawings on rough grey paper, which will take colour very well. We scarcely know of any better present for children with a turn for dabbling in water-colour—that is, for all children.

*The Fireside* (edited by the Rev. Charles Bullock. "Home Words" Publishing Office).—Every kind of story and poem has found its way into this volume of *The Fireside*; but the leading tale is from the pen of Mrs. Marshall. This lady, whose energy is untiring, is a great favourite with many readers. Her books are full of pleasant domestic scenes, and her minutely described costumes are a challenge to all feminine minds. Some, disposed to cavil, might suggest that a more suitable trimming than cream-coloured lace might be found for a beaver hat; while others would possibly say that Dr. Andrew Clarke and Mr. Richmond, R.A., had better be introduced under other names than their own. But these things, like the real soap and water used in a play, give an air of truth to the whole.

*Great Heights gained by Steady Efforts* (Rev. T. P. Wilson. Nelson).—One out of the two examples of perseverance in this book is unhappily chosen. It might be possible for a stupid workhouse boy of sixteen to develop, by plodding, into a clergyman of twenty-four; but no amount of efforts, however "steady," could implant a genius for drawing like that of Sarah Jones if the genius were not already there. We admired the courage of the author in giving his heroine such a name, even though we were quite certain she was not destined to go through life with it. And so, indeed, it proved, for without any efforts—steady or otherwise—on her part, the founding Sarah Jones, adopted child of a carpenter, turns out to be Grace Manton, only daughter of a baronet. Religion is obtruded far too much upon the reader, and the conversation of the young officer who talks of his conversion will only too probably have an effect opposite to what the writer intended.

*The Leisure Hour* (London).—Miss Bird's travels in Japan have afforded matter for some very interesting quotations and observations. The long story, "Will he no' come back again," by Miss Saxby, is hardly up to the usual mark, nor is the shorter one, "Misjudged," much better. The rest of the volume is, however, carefully compiled, and will wile away many long evenings.

*St. Nicholas: Scribner's Illustrated Magazine* (conducted by Mary Mapes Dodge. Warne).—*St. Nicholas* is always delightful, and it contains this year a most fresh and original story of camping out, called "Mystery in a Mansion." There are one or two sketches from Mrs. Oliphant's unwearying pen, and other popular authors have been pressed into the service. The illustrations are by no means superior to those in our English magazines.

*Sunday at Home* (Religious Tract Society).—The *Sunday at Home* is less exciting than usual as regards the long stories; but there is the ordinary amount of instructive reading and scriptural

acrostics, and there is a description of a most eccentric invention called a Bible clock. The point of this consists in having a text for every hour of the day, containing the same number of words as there are strokes to the hour. This may have the effect of stimulating to piety; but, on the whole, we should have thought it simpler and more edifying to contemplate the texts in their original setting.

*Jeanie Nairn's Wee Laddie* (Miss Grant. Hatchards).—There is something attractive in the mere outside of this little book, and its inside does not disappoint us. It is full of simple lifelike sketches of Scotch country life, and will not fail to interest any one who takes it up.

*Every Boy's Own Annual* ("Leisure Hour" Office).—If gorgeousness is attractive to boys, this annual will be a favourite indeed with the rising generation. In the first place, there is a gaudy picture of "Famous Cricketers," whom their own mothers would fail to recognize; a jocosely printed, called "Social Transformations"; some brilliant flags, and some quiet-hued fishes. We must mention, by the way, that the dubbing of the fly-hooks is far too thick. Every kind of subject calculated to amuse or interest a boy is to be found in the letterpress, together with many suggestions that will be equally welcomed by their parents as a means of keeping them quiet during the holidays.

*Ambrose Oran; or, with the Buccaneers* (F. Scarlett Potter. S.P.C.K.).—The adventures of Ambrose Oran are of a comparatively unfamiliar sort. The hero, who takes service with a buccaneer captain in 1665, for the purpose of enabling his mother and sister to travel down to Somersetshire with his bounty money, is sold into slavery in Jamaica. After some years of a hard life he escapes, and becomes a hunter in Hispaniola, and next joins the fight for the possession of Panama. The intervals between these events are filled with all kinds of stirring deeds, and rather more horrors than are suitable for children. The illustrations are almost the worst we have seen yet.

*Hurricane Harry* (W. H. Kingston. With Illustrations by R. Huttula. Griffith and Farran).—No country from Nova Scotia to the coast of Guinea comes amiss to Hurricane Harry, a young gentleman who flourished in the middle of the last century. On reaching the years of discretion, which were so soon arrived at in those halcyon days, Master Harry entered the navy, and took part in the war with the Caribs. Adventures at sea were, however, insufficient to satisfy the young sailor, and he hurried back to England in time to take part in the Gordon riots. It is wonderful that in this scrambling existence he found time for love-making, but he did manage to do so, although this is discreetly kept in the background, with due regard for the age and sex of the readers. Let us all be thankful we did not live in those days, if people then were half as hideous as these drawings make them out to be.

*Great-Grandmother's Shoes* (Stella Austen. Masters and Co.). Miss Austen's tale, though a little disjointed, is a pleasant story of the plays and adventures of some country children. There is perhaps rather too much moralizing; but, on the whole, it is well written, and healthy in tone.

This is a great year for Christmas Cards. Messrs. De La Rue send us almanacs, cards, and Russia-leather pocket-books, which are not only a joy, but a practical benefit for ever. Messrs. Eyre and Spottiswoode excel in floral cards. Messrs. Philipps call their cards in various decorative styles, "The Gallery Series." Messrs. Mansell's cards represent, in very attractive hues, all things on the earth, and a number of sea fairies in the waters under the earth. Mr. Rothes furnishes us with some sporting cards, among others. Mr. Raphael Tuck sends copies of the cards which were successful in last year's competitive exhibition. They are very various in style, and many of them very pretty.

Among other genial additions to the endearing festivities of Christmas is the *Renaissance Photograph Album* (Marion and Co.). We see no particular connexion between this tome and the revival of art and letters, nor can we praise the decorative borders of the pages.

Messrs. Kent have published a neat and stout box full of poetry, including Wordsworth, Shakespeare, Scott, and others. The twenty-four volumes are neat, but the text necessarily small.

#### GERMAN LITERATURE.

IT would hardly be fair to affirm that the lovers of scandal alone will be disappointed with the correspondence of Dorothea von Schlegel (1) and her sons Johann and Philipp Veit, for the disappointment extends to the lovers of biography and literary history. The separation of Mendelssohn's daughter from her admirable, but prosaic, Jewish husband; her union with the younger Schlegel, the hierophant of the Romantic school; and her subsequent metamorphosis into a Roman Catholic devotee, are in some degree symbolical of the whole history of the Romantic movement, beginning with a feverish revolt against conventionalities, and ending in subjection to a far more oppressive yoke. The intimate history of the affair, also, must have been most interesting, with its far-reaching consequences, and its influence on the lives and opinions of such men as the Schlegels and Schleiermacher, and its con-

nexion with the great literary scandal of "Lucinde." Unfortunately, the most important *pièces justificatives* perished when Henriette Herz, Dorothea von Schlegel's bosom friend and mediator with her first husband, destroyed her correspondence at the latter's request. The collection before us is not made in the interests of biography, but of the Roman Catholic Church; and its object is to show how a questionable proceeding, excusable, however, on the ground that the delinquents were only Jews and Protestants, resulted in the acquisition by the Roman communion of a quartet of very passable saints. It can hardly be doubted that Dorothea must have left behind her correspondence more worthy of her intellectual reputation than the letters to her sons while pursuing their artistic studies at Rome which constitute the bulk of these volumes. They indicate the careful, affectionate mother and the shrewd, observant woman; but are neither more nor less interesting than the domestic correspondence of thousands of other clever women of whom the world has never heard. The scanty correspondence of her unconverted period is as much more interesting as was the company she at that time kept. Tieck, Novalis, the Schlegels are introduced with so much piquancy that, although in reality learning little about them, we seem to know them better than ever before. The greater the pity that a life which promised so much, attractive in its very errors, should have become, in comparison, a *caput mortuum*. During her transitional period between Judaism and Catholicism the influence of Friedrich Schlegel is very apparent, both in her letters and the aphorisms selected from her diary; but after her conversion there is little trace of any predominating intellectual influence. Her sons—Philipp especially—appear as worthy young men, and, as such, attractive, but with little of special interest to say; nor does their standing in the world of art seem to altogether justify the space claimed for them. The book, however, ends abruptly at 1817, twelve years before Friedrich Schlegel's death, and twenty-two before Dorothea's.

England has recently produced two excellent biographies of Lessing, each of which has enjoyed the honour of a translation into German. Herr Düntzer (2), however, thinks there is room for another; and, although his work has no pretensions to the literary merit of Mr. Sime's or Miss Zimmer's, it occupies a ground distinctly its own, which sufficiently justifies its publication. It is a companion to the author's previous biographies of Goethe and Schiller, and is, like them, almost entirely occupied with the incidents and external circumstances of Lessing's career, enriched with copious particulars of the persons with whom he was brought into connexion, and accounting, so far as may be, for every day of his life. Lessing's roving and unsettled existence did not allow the same luxuriance of personal intimacies and local associations to spring up around him as Goethe and Schiller amassed at Weimar; and hence his life, while more susceptible of interesting biographical treatment in the ordinary style, is less adapted for the method followed by Herr Düntzer. He has, nevertheless, collected, with extreme diligence, sufficient portraits, facsimiles, and views of places to equip a handsome illustrated volume, exceedingly useful as a ready and trustworthy means of reference to the leading facts of Lessing's life, and bearing much the same relation to biographies executed in a more purely literary spirit as a good topographical handbook does to the history of a country.

A very handsome volume, got up with a degree of typographic luxury unusual in Germany, records the history of a person of some importance in Lessing's life, the actress Caroline Neuber (3). The theatre conducted by Caroline during Lessing's early residence in Berlin first awoke Lessing's enthusiasm for the stage, and she produced in 1748 his first piece, *Der junge Gelehrte*, an insignificant performance in itself, but marking an epoch from which the regeneration of the German theatre may be dated. It was at that time in a miserable condition, alike devoid of good pieces and good performers. The best plays it could show were translations from the French, which, indeed, continued to be the case till long afterwards. Baron von Reden-Esbeck has published in facsimile a playbill of a translation of Ibsen's "Distract," and also one of a tragedy-ballet on the story of Faust, curiously indicative of the condition of the theatre at the time, and valuable as an illustration of Goethe's poem. Neuber's own company was merely a strolling one, moving from place to place, and her career was most unfortunate. She was at one period closely allied with Gottsched, the dictator of the German literary republic in his day, but more chiefly remembered as the victim of Lessing's ruthless polemic. Misunderstandings, however, crept in, and Neuber lost credit by appearing in a piece designed to ridicule her former benefactor. Nothing else is laid to her charge; but after her death at Leipzig, in extreme poverty (1760), she was refused Christian burial for having been an actress, an outrage atoned for by an expiatory service in 1852. Lessing had the highest opinion of her powers, and her name will always be connected with the revival of the German drama. Baron von Reden-Esbeck's monograph is too long for the intrinsic importance of the subject, but is highly creditable as the refined amusement of an amateur of the drama, and wants no recommendation in the shape of fine paper and print, and interesting facsimiles of autographs and playbills.

A sketch of Prince Alexander Galitzin (4), Minister of Public Worship under Alexander I., by his assistant, the late Peter von Goetze, is full of interest, though rather as a contribution to our knowledge of a singular phase of Russian history than as a biography of the Prince himself. Galitzin, who is represented as a most high-minded and amiable man, had his full share in the remarkable religious reaction which so strongly influenced State affairs during the latter years of the reign of Alexander I. After long enjoying the Imperial favour, he became compromised in the disgrace of the patrons of the Bible Society, and assailed by the reigning favourite Araktschejeff and the fanatical monk Photius, whose pretended revelations had obtained an almost incredible influence over Alexander's mind, was removed to the subordinate department of the Post Office. Photius, Araktschejeff, and other persons concerned in these intrigues, are sketched with great spirit by Goetze, who was himself disgraced, but subsequently obtained an honourable situation in the Ministry of Finance. Galitzin enjoyed the personal favour of Alexander's successor in a high degree, but never again took a prominent part in public affairs. Goetze himself appears as a sensible, clear-headed German, a man of perfect integrity and high culture. His memoirs, though containing few facts of first-rate importance, convey a vivid impression of the unwholesome condition of public affairs under Alexander I., a prince too intelligent to be unconscious of his incapacity to support the tremendous burden imposed upon him, and who, like Friederich William IV. of Prussia under similar circumstances, sought for a spurious strength in a kind of spiritual dram-drinking. The parallel between the two Alexanders is in some respects startling. Araktschejeff is naturally depicted in the most unfavourable colours; but some of the traits recorded of him seem to indicate strong affections and real magnanimity. There are several anecdotes of Catherine II., mostly illustrative of her refined tact and real goodness of heart when political considerations did not interpose.

The latest narrative of the celebrated African traveller, Gerhard Rohlfs (5), is the account of the abortive commencement of what was designed to have been one of the most extensive of African explorations. Starting from Tripoli, Herr Rohlfs was to have proceeded northward until he reached the valley of the Congo, and to have determined the watershed between that river and the tributaries of the Niger. Upon reaching the oasis of Kufra, however, a spot about eight degrees south of Bengazi, the expedition was arrested and plundered by a native chief; and, although the travellers were subsequently released and a portion of the spoil restored, it was deemed inadvisable to proceed further. The travellers owed their deliverance in great measure to the intervention of the Snussi, a society of dervishes of recent origin, but who have already obtained an influence in that region of Northern Africa corresponding to that exercised in Central Asia by the late Akhund of Swat. They are usually regarded as exceedingly fanatical; but their chief, a highly intelligent man who works miracles every day, is probably well aware of the danger of molesting Europeans under the present dispensation. As it was, Prince Bismarck interfered, and compelled the Sultan to redeem the obligation of his nominal sovereignty over Tripoli by a compensation of 800*l.* to the German Geographical Society. Under these circumstances, Herr Rohlfs's book cannot be expected to possess much importance as a record of travel, though there is no lack of bright and attractive sketches. His account of Tripoli possesses some special interest as the most recent, and in view of the political complications to be expected in the Regency. The city of Tripoli has, he says, made great progress since his last visit, entirely owing to the development of the trade in halfa (*Sida tenacissima*), a plant used in the manufacture of paper, which yields a sure crop, independent of the weather, and exempt from the attacks of locusts. The oasis of Kufra, he thinks, may originally have been a marsh. The most valuable part of the book is perhaps Dr. Ascherson's appendix on the plants brought home by the expedition, with a catalogue of the specimens and an historical survey of North African botany.

Dr. Reuss's "History of the Old Testament Scriptures" (6) is a very well executed summary, not only of the books themselves, and of the questions relating to their date and authorship, but of the circumstances of the times of which they treat, distinguished by a spirit at once liberal and conservative, and very clear. Its most important feature, however, is the extensive accompanying bibliography.

Dr. Zart's (7) sketch of the influence of English philosophy upon the German philosophy of the eighteenth century, a prize essay, is perhaps less interesting as a contribution to its ostensible subject than as a sketch of a number of meritorious writers, followers for the most part of Leibnitz or of Wolf, who have been almost entirely forgotten.

There are many sound and ingenious remarks in Sophus Schack's

"Studies in Physiognomy" (8), but they are marred by an endeavour, carried to an extravagant length, to trace out fanciful resemblances between human and animal countenances.

From Vienna we have the most important study in English metre that has appeared since Dr. Guest's *History of English Rhythms* (9). The first instalment, a goodly volume of 565 pages, after some introductory chapters describing the sphere of metre, which Dr. Schipper elevates to a science, to be considered from the æsthetic, the empiric, and the historic point of view, treats of Old English poetry. This the author divides into the Anglo-Saxon age and the Old English age, the latter comprehending two periods, the Norman and the Transition. He traces the story and the development of English verse through the early strict alliteration, the mingling of alliteration and rhyme, the attempt to combine accentuation with numeration of syllables, and the various strophes used by our ancient poets. Dr. Schipper speaks with enthusiasm of the high point to which English versification attained at an early period, and points out the importance of the study of metre, as yet unduly neglected, as a necessary aid to the establishment of a really satisfactory theory. His work abounds with evidences of care and learning, and we trust may receive in this country the attention to which it is entitled. Its value is enhanced by a full index.

Woldemar Kaden (10), who has already produced a volume of light sketches of Italian matters, comes forward with another of still lighter substance, but as lively and entertaining as the author designed them to be. We are only at a loss to perceive the relevancy of an essay on some points connected with the *Faust* of Goethe, whose "Italiänische Reise" would surely have been more in place. The other papers include disquisitions on Tasso, on Italian popular superstitions, on shows and miracle plays, and on the tragical history of the beautiful, but unfaithful, Duchess d'Avalos.

The concluding volume of Robert Pröles's *History of the Modern Drama* (11) embraces nearly all the history of the French drama that is not of merely antiquarian interest. There seems a curious indifference to proportion in the unequal distribution of the volume between the classical and the modern French drama, the former occupying four-fifths of the whole, although information respecting it is so much more accessible. His account of the Romantic reaction in France, and its manifold developments, must be pronounced meagre and unsatisfactory, while his treatment of the classical epoch is good and full.

The author of the "Jews of Barnow" and "Moschko of Parma" has again achieved a decided success as a novelist (12), qualified only by the fact that he has this time been less studious of brevity and finish. The story of Tamas, a Galician popular champion, not altogether unlike Sacher Masoch's "New Job," only that his end is tragical, is decidedly too long. It is nevertheless full of fine feeling and spirited portraiture, interspersed with beautiful pictures of natural scenery.

"A Million," by E. A. König (13), is a fair average novel of incident, but rather commonplace and mechanical.

The *Rundschau* (14) opens with an elegant, although somewhat too artificial, story by Hans Hoffmann, founded on the Roman version of the myth of Molusina. The writer has evidently made Paul Heyse his model, and the pupil is not unworthy of the master. A review of the recently published biography of the great publisher Brockhaus contains some striking instances of the official persecution of liberal ideas in Germany after the War of Liberation. Another series of the Paris correspondence of the philologist Hase during the Consulate afford an insight into the French affairs of the time, especially the confusion in legal and ecclesiastical affairs before Napoleon took them in hand; and a translation of a report of Count Pahlen, dated 1867, expresses the apprehensions even then entertained by Russian statesmen of impending social disorganization.

It is a fault of *Auf der Höhe* (15) to have too many short contributions. Perhaps, however, the shortest is the most important, if Professor Palmieri proves accurate in his brief announcement of his discovery of helium, a metal hitherto only met with in the solar spectrum, in the lava of Vesuvius. The Italian novelist Ciampoli contributes a powerful, but fantastic, tale, "The Adderman"; and the editor himself a pretty child's story. The most interesting of the other contributions are Professor Schwieher's sketch of Hungarian politics on the eve of the Revolution of 1848, and O. Hankiewicz's specimens of Ruthenian proverbs. The foreign correspondence is a valuable feature of the periodical.

(8) *Physiognomische Studien*. Von Sophus Schack. Aus dem Dänischen von Eugen Liebhich. Jena: Costenoble. London: Kolckmann.

EMINENT LIVING PAINTERS.

**ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.**

Established by Royal Charter, 1844.

FOR THE SCIENCE AND PRACTICE OF AGRICULTURE.

For intending Land Owners and Occupiers, Land Agents, Surveyors, Colonists, &c.  
The COLLEGE FARM, for the practical instruction of the Students, surrounds the College, and is a mixed Farm of about 240 Acres.  
1 resident—His Grace the Duke of MARLBOROUGH, K.G.

Committee of Management.

The Right Hon. the Earl of DUCIE, Chairman.

The Right Hon. the Earl of BATHEURST.

The Right Hon. Sir MICHAEL E. HICKS-BEACH, Bart., M.P.

Lieut.-Col. R. NIGEL F. KINGCOTE, C.B., M.P.

GEORGE T. J. SUTHERTON-ESTCOURT, Esq., M.P.

AMBROSE L. GODDARD, Esq.

EDWARD BOWLY, Esq.

WILLIAM JOHN EDMONDS, Esq.

Major T. W. CHESTER MASTER, M.P.

For Prospectus of COLLEGE and FARM, List of Scholarships, Prizes, Diplomas, &c.  
apply to the PRINCIPAL.

NEXT SESSION begins January 31.

**BRIGHTON COLLEGE.**

Principal—Rev. T. HAYES BELLIER, M.A., Queen's College, Oxford.

Vice-Principal—Rev. J. NEWTON, M.A., St. John's College, Cambridge.

A special Arrangement in which preparation is made for Sandhurst, Woolwich, Conyn's Hill, and Indian Civil Service, has been in active force for some time. The course of instruction enables boys to go up for the examination direct from the College.  
The NEXT TERM will commence on Friday, January 27.

F. W. MADDEN, M.J.A.S., Secretary.

**DOVER COLLEGE.**

Principal—Earl of GRANVILLE, K.G.

Next Term will commence on January 18. Board, 446 6s. Tuition from 13 to 18 Guineas.  
For particulars apply to the Rev. W. BELL, M.A., the Head Master, or W. ESOMES Esq., the Honorary Secretary.

**MALVERN COLLEGE.**

The NEXT TERM commences on Friday, January 27. Entrance Examinations on January 26. For particulars apply to HENRY ALDINGTON, Esq., Secretary.

**SOMERSETSHIRE COLLEGE, BATH.**

The College is divided into Classical and Modern sides. BOARDERS are taken in the Senior Department by the Head-Master, in the Junior Department by the Rev. PHILIP CHICK, M.A. Special attention is given to Medicine or Book-keeping Boys. For Prospectus, List of Honours, &c., apply to the Head-Master, T. M. BROMLEY, M.A.

**ISLE OF WIGHT COLLEGE, RYDE.**

THREE ENTRANCE SCHOLARSHIPS.

The NEXT TERM begins January 26th.

For particulars apply to the HEAD-MASTER.

**KELLY COLLEGE, TAVISTOCK, South Devon.**

Chairman of Trustees: The Right Hon. the Earl of DEVON.

Head-Master: ROBERT W. TAYLOR, M.A. Formerly Fellow of St. John's College, Cambridge, 17th Wrangler and 4th Classic 1860.

BOYS prepared for the Universities, the Army, Navy, and Civil Service Examinations, and the Professions. Large airy buildings; healthy and bracing position, facing Dartmoor; spacious playground; home comforts. Inclusive Fees for Boarders, £24 per Term. NEXT TERM commences January 20, 1882. For Prospectus, &c., apply to the HEAD-MASTER.

**ST. ANDREW'S COLLEGE, CHARDSTOCK, Dorset.**

Terms moderate and inclusive. NEXT TERM begins January 27, 1882.—Apply to School Secretary.

**TRINITY COLLEGE SCHOOL, STRATFORD-ON-AVON.**

Founded by the Rev. J. D. COLLIS, D.D. The Warden, RICHARD F. CURRY, M.A., is assisted by seven Resident Masters. Classical and Modern sides. Preparation for the Universities, and all competitive Examinations. Special Classes for the Army Examinations. Great attention paid to Modern Languages. Junior Department for Young Boys. Large Playing Fields, Gymnasium, Fives Courts, &c. &c. Terms 30 and 60 Guineas per annum.—Apply to the WARDEN.

**WOOLWICH, SANDHURST, O.S. MILITIA, &c.—Professor FRITCHARD**

(late R. M. Academy, Woolwich) and his Brother can receive APPLICATIONS for NEXT TERM. Over Forty Successes already for 1881. Highest placed Candidates for Sandhurst (last summer), No. 1 for Woolwich, No. 18 for C.S. Militia, No. 11 (three-fourths passed last month). Strong staff of resident tutors, mostly all residents, and like Messrs. FRITCHARD, devoting their entire time to the Pupils.—Address, Rev. A. FRITCHARD, Wargrave, Henley, Oxon.

**MILITARY COMPETITIVE for MILITIA OFFICERS.**

Messrs. FRITCHARD will CONTINUE their COURSE for the above till December 31, and resume January 1 to date of examination. They are assisted by experienced officers of the Staff College. Nine successes thus far. Highest place gained at yet No. 3.—Address, Rev. A. FRITCHARD, Wargrave, Henley, Oxon.

**FOLKESTONE.—Mr. W. J. JEAFFRESON, M.A. Oxon.,**

assisted by a Cambridge M.A. and competent Teachers, prepares PUPILS for the Universities, Woolwich, Sandhurst, and all Competitive Examinations. A few Vacancies.

**AMESBURY HOUSE, PAGE HEATH, BICKLEY, Kent.**

Rev. EDMUND ROWLE, Author of a very successful Series of Latin and Greek School-books, receives THIRTEEN BOYS under the age of Fifteen, to prepare for the Public Schools.

**PRIVATE TUITION, on the North Devon Coast, by a**

CAMBRIDGE M.A. (Married), late Theological Prisoner of his College. Twelve years experience. Only Three Pupils received. One VACANCY after Christmas for a well-disposed YOUTH preparing for Matriculation, &c. Home comforts. Plenty of afternoon amusement. Competent Masters for French, Drawing, &c. Good references.—For full particulars address, C.O., at C. H. May & Co.'s General Advertising Offices, 78 Gracechurch Street, London.

**WHARFE-DALY SCHOOL, near BEN-RHYDDING, Leeds.**

A PUBLIC SCHOOL for BOYS of GENTLEMEN.—Preparation for Scholarship and other Examinations. Modern Languages. Natural Sciences. Splendid site. References to Noblemen and Church Dignitaries, &c.—Apply to Rev. T. GRANGER HUNT, M.A., Bedburgh School, Yorkshire.—Entrance Scholarship Examination in January.

**OAKHAM.—Archdeacon JOHNSON'S SCHOOL.**

Head-Master—Rev. E. V. HODGE, M.A., Balliol College, Oxford.

Boys are eligible to Four Leaving Exhibitions of £20 per annum from the School; Sixteen Johnson Exhibitions at Cambridge; Three or more School Exhibitions from £10 to £25; Three Prizes of £10. New Class-rooms have lately been built, and a new House opened last Term. NEXT TERM begins January 16.

**A RESPECTABLE, middle-aged MAN would be glad of**

EMPLOYMENT of any kind; is a fair scholar, and has held appointments of great responsibility. First-class recommendations. Moderate remuneration.—Address, J. G., 2 Granby Street, Hampstead Road, N.W.

**PENINSULAR and ORIENTAL STEAM NAVIGATION COMPANY.**

UNDER CONTRACT FOR HER MAJESTY'S MAILS TO INDIA, CHINA, and AUSTRALIA.

REDUCED RATES OF PASSAGE MONEY.—SPECIAL RETURN TICKETS.

Departures for—

SOMERSET, CALCUTTA, Ceylon, Fortnightly } From Gravesend, Wednesday, 12.30 P.M.

CHINA, JAPAN, } From Bristol, Monday.

EGYPT.

SIR WILLIAM GREGORY has given in a letter to the *Times* a very interesting account of an interview he has lately had with Colonel ARABY BEY. This enterprising officer, who has been the ringleader in the mutiny of the army against the KHEDIVÉ, and is now the head of the Egyptian national party, had the good fortune to produce a most favourable impression on the mind of his English visitor. He is described as a tall, athletic, soldierly man, ready and able to give his opinions, holding views that betoken a high purpose, and having quite as much enlightenment as could possibly be expected in an Egyptian Colonel. He acknowledged the religious supremacy of the SULTAN as Caliph, but wished to admire him at a distance, and was resolved to do his utmost to keep Turks and Turkish soldiers out of Egypt. He proposed the utmost toleration for Christians and Jews; for they equally with Mahomedans obey the eternal laws of God, and of these laws the COLONEL spoke with a fervour and a dignity which entitled his utterances, in the opinion of Colonel GREGORY, to rank with the majestic effusion of the *Antigone* of SOPHOCLES. He declared that the army wanted nothing but justice, that it was the appointed spokesman of the dumb multitude, and that all that it had done had been done in order to give the only possible expression to the national longing for independence. In time of peace he owned that the army had no claim to be supreme; but his advance in political science was sufficiently imperfect to permit him to lay down as an incontestable axiom that, in time of war, the army must rule as well as fight. He has no objection to the continuance of the Control until Egypt is more fitted than it is at present to govern itself altogether; for he recognizes that it is to the intervention of the Control that the cultivators owe the present improvement in their position. But he vehemently urged the injustice of Egyptians being superseded by foreigners in the more lucrative posts of minor departments of Government. Nothing could be more instructive as to his character and capacity than his remarks on this head. He is one of those men, numerous in every society, and especially in every semi-civilized society, whose generous feelings are easily awakened by trifling and superficial facts. He has heard of foolish Europeans firing off harmless pistols to amuse themselves and frighten the natives, and of the European glances of indiscreet wonder which the native women have occasionally attracted; and he leaps to the conclusion that this unseemly behaviour is the general characteristic of young European officials. He was smitten with patriotic horror of natives working in the sun to carry out the operations of the Cadastral Survey, while a highly paid European sat indoors recording the results of their work. Under every form of government those who are fitted for nothing but manual labour must do it, while some one qualified for higher work must sit when he can do it, and be paid enough to make him undertake it. For higher work the COLONEL was obliged to own that there were no honest Egyptians properly qualified, and that the Egyptians who professed to be qualified, and intrigued for the higher posts, belonged to the veteran gang of plunderers who flourished in the days of ISMAIL, and hope that a good day is now dawning for them once more. The COLONEL is, no doubt, personally imposing, and is beyond the suspicion of being corruptible; he talks of

eternal laws, in the spirit, if not in the language, of SOPHOCLES; he fully believes that he is working in a good way for a good cause; but he has only got a very slight way at present on the road to statesmanship. Possibly from want of opportunity, he has not displayed any greater amount of military courage and capacity than was needed to bully a young and timid prince. Otherwise he might be fairly compared with GARIBOLDI, who gave aid and impulse to the national movement, but who, had he not been led and superseded by men of a very much higher stamp, would never have achieved the independence and unity of Italy.

The kernel of the Egyptian difficulty lies in the relations of the army, and, so far as the army represents the people, of the people to the KHEDIVÉ. ARABY BEY candidly owned that the army would have liked to revolt against ISMAIL, but was too thoroughly afraid of him to move a step. When ISMAIL was replaced by TEWKI, the leaders of the army thought the time had come to ascertain whether the son was as formidable as the father; and the result of the experiments they made has been to assure them that TEWKI was not a man to frighten any one. Conscious of his weakness, and with religious tendencies which prompt him to think more of the Caliphate than of eternal laws, TEWKI has sought, and is driven to seek more openly every day, support and strength from the SULTAN. He hopes that the troops of his master will shelter him from the attacks of his own disobedient army. The national movement in Egypt, if the assurances of ARABY BEY warrant us in speaking of the national movement, is rapidly passing from a movement against Christian intruders into a movement of one set of Mahomedans against another. There was one expression used by ARABY BEY during his interview with Sir WILLIAM GREGORY which was full of serious meaning. He said that Egypt was universally considered as the centre of the Mahomedan world. It is precisely because he, too, recognizes that Egypt may, with perhaps some little exaggeration, be termed the centre of the Mahomedan world, that the SULTAN wishes to command it. That the centre of the Mahomedan world should be held by independent troops, who will not let the troops of the CALIPH come near them, strikes at the root of the Caliphate. ARABY BEY professes, indeed, a kind of theoretical respect for the Caliph for the time being; but the Caliph of the day may not be the Caliph of the morrow; and, rigid as Mahomedanism is in many respects, it is singularly elastic in the choice of its spiritual chiefs. It is always found that Sheikhs who give the highest class of oracular decisions can be deposed for some ingenious reasons in deference to the wishes of a powerful sovereign or a powerful populace; and the head Sheik of Egypt has recently been changed to meet the views of the leader of the army. The centre of the Mahomedan world, if physically strong enough, and invested with the eminence of temporal independence, might easily persuade itself and its supporters that the *Caliph of OTTOMAN* had lost their claim to the Caliphate. For the SULTAN, therefore, the independence or subjection of Egypt is a question full of the gravest issues. The present KHEDIVÉ, having to choose a side in the contest which has already begun, has chosen to throw in his lot with the SULTAN. He is the champion of a dependence that would keep him safe as against an independence that would sweep him away. Matters may go on more or less smoothly for a time, but everything points to the probability that the day

will come when the KHEDIVI will either abdicate or will call for the aid of Turkey. It is premature at present to speculate on what course England ought to take when the occasion arises; but the English Government cannot allow itself to forget that before long it may have to decide whether the SULTAN shall or shall not be allowed to crush the nascent independence of a religious centre which threatens the privileges and position on which he sets the highest value.

Among the other objects on which ARABY BAY and his friends were supposed to have set their hearts was the increase of the army, and the WAR MINISTER whom they appointed has applied for an increase of the army from twelve to eighteen thousand men. The proposal has been rejected by the Control, because it would involve an outlay of more than a quarter of a million a year. But an increase of 100,000*l.* has been conceded, which it is said may, perhaps, suffice to provide for an army of fifteen thousand men. The increase has been conceded, because the Control thought that some additional forces were really needed. It is often assumed that the Egyptian army can have nothing to do, and it is true that ordinarily it has little to do, and has ample leisure for intrigues and insubordination. But some troops are always wanted, and every now and then occasions arise when many troops are needed. The Egypt known to ordinary travellers may be easily kept in order by a good local police; but there is a wild and very disorderly Egypt beyond, where even disciplined troops have very rough work. Intelligence has just been received that, in the far South, a new prophet has appeared, who gathered together, without the slightest difficulty, a band of followers, and out to pieces an Egyptian regiment that was sent to put him down. A force strong enough to ensure success has now to be sent from the army of Lower Egypt. It is obviously an arduous and expensive undertaking to send troops many hundred miles into a territory so wild that a prophet can in a few days collect more than a thousand men under his standard. Nothing could show more clearly that every Egyptian Government must have peculiar difficulties to encounter; and these peculiar difficulties would exist, and might, perhaps, exist in an aggravated form, if the government of Egypt were in the hands of England. The assumption of the government of Egypt by England might, under conceivable circumstances, be necessary, but it would be a very disagreeable and painful necessity. It is a thing to be avoided, if possible, not a thing to be lightly taken up as the pastime of a great nation. Even if Europe assented—and to assume this is to assume very much—the inherent difficulties of the enterprise are such as to make the most reckless politician think many times before he talks lightly of sending English troops to Cairo. It is not known Egypt, so much as unknown Egypt; that gives just cause of alarm. We should have not only to maintain order where order is scarcely ever disturbed, but to introduce order where order is unknown or most precariously upheld. We should have to hold ourselves answerable for the suppression of the slave trade from the mouths to the sources of the Nile. With time, money, and men we could, no doubt, do what we had undertaken to do; but the cost and the sacrifice of life would be most serious. ARABY BAY said that he trusted to the justice of England not to seize on Egypt; he may trust, not only to the justice of England, but to its common sense when Englishmen begin to realize what seizing on Egypt means.

#### THE LODGER FRANCHISE.

THE decision of the Court of Appeal in *BRADLEY v. BAYLIS*, and two other cases, is so far satisfactory that it diminishes the mischievous effect of a scandalous legislative miscarriage. At the same time the judgment furnishes an additional illustration of the accidental nature of a serious change introduced by inadvertence into the Constitution. A large number of voters, mostly unfit, may be added to the register on the wholly irrelevant ground that the landlords of the rooms which they occupy are not resident on the premises. Another large number may be excluded from the register because their landlords live in the same houses with themselves; but revising barristers will be puzzled to determine whether in such cases the occupier of the house exercises any control over the rooms of the lodgers. The

casual nature of the distinction which has been unintentionally created by the Act may possibly apply an argument for equalizing the franchise by a promiscuous extension of the right of voting to all lodgers, or to all male adults. Incidentally, the Court of Appeal will have decided another question, of an entirely different kind. Judges in the first instance will in future be inclined, if they have a discretion, to allow appeals in cases of great importance, although they may be confident in the justice of their own opinions. If the judgment of the Divisional Court of the Queen's Bench had not been subject to revision, a grievous injustice would have been perpetrated, though with the best intentions. The reasoning by which the final decision was supported will be generally accepted as sound, though the result may be disappointing. There is for the present no measure of the evil which may result from the intolerable carelessness of Parliament. The next registration will perhaps apply statistics of the proportion of householders who let lodgings in more than one set of buildings. The enfranchised voters may turn out to be of the lowest class, as the tenants of professional lodging-house keepers. A resident landlord has a somewhat stronger motive for excluding thieves, habitual drunkards, and the pious and disreputable classes in general. The labour of the parochial officers, who are responsible for the list of voters, will be enormously increased by the introduction of a revised version of the Constitution. To avoid the trouble of minute inquiry, they may be willing to accept any statement which may be made by the lodging-house keeper or one of the inmates as to the number, names, and length of residence of the electors. A register drawn up on hearsay would be a suitable result of random legislation.

From the time when the Divisional Court decided that nearly the whole adult male population was entitled to vote in boroughs, the objections to a new or newly discovered Constitution were in no degree directed against the Judges. Although the Judges seem to have been most akin in their interpretation of the Act of 1878, it was impossible to deny that the judgment was consistent with the words of the disputed clause. The phrase "judge-made law," though it has sometimes been invidiously used, implies not usurpation on the part of the courts of law, but neglect of duty by those who, in or out of Parliament, are responsible for legislation. It is only by a figure of speech that law, and especially statute law, can be said to be made by Judges. When, in the discharge of their duty, they elicit from an enactment a result which had never been foreseen, they are, by a conscious or involuntary metaphor, said to make the law which they declare. In modern times, even when their decisions involve the gravest political consequences, their impartiality is exempt from suspicion. Both the Court of original question and the Court of Appeal discussed one or two stupid and confused sentences with the dispassionate acuteness which scholars might exhibit in construing a corrupt passage in a Greek chorus. The slovenly practice of Parliament would not compare favourably with the dexterity of the ideal copyist or the dullest commentator. The methods of legislation which are thought good enough for the country were lately illustrated in the typical instance of the Welsh Sunday Closing Act. In various districts of the Principality the Act comes into operation at different times; and the ablest justices have found it impossible to re-capture the terms of the Act with the known intention of its authors. The peer who took charge of the Bill in the House of Lords lately explained the confusion which has arisen in a manner which he apparently thought satisfactory. Having discovered the flaws in the Bill, he was about to introduce the necessary amendments, when the promoters of the measure in the House of Commons entreated him not to incur the risk of losing the Bill through further delay. A faulty and unintelligible draft was therefore deliberately submitted to the House of Lords; and the Peers, being prepared to accept the principle of the Bill, probably agreed for the expediency to the mover. The Act, which has now been considered and construed by the Court of Appeal, may perhaps have been subject to similar treatment. No part of the discredit attaches either to the judges or to the established principles of legal construction. The rule that Acts of Parliament must be exclusively interpreted by their own language is, on the whole, both convenient and

## POLITICS IN 1881.

THE miserable condition of Ireland so entirely absorbs public attention that the general history of the past year can only be recalled to the mind by a conscious effort. At the beginning of 1881 outrages of all kinds were constantly perpetrated in Ireland. At the end of the year violence and anarchy are still more universally prevalent. The pretence of resistance to unjust demands on the part of the landlords has been exchanged for a general refusal of rent. Tenants who are really or professedly willing to pay excuse themselves on the ground of threats which are too often actually executed. It is scarcely to be regretted that the Land League, which had from the first stimulated crime, finally, by forbidding all payment of rent, provoked the Government to declare its suppression and to arrest some of its leaders; but the organization maintains its vitality in the absence of a visible centre, and Mr. PARNELL and his allies may boast that they have discovered a political secret in their successful appeal to the worst of human motives. At this time last year it was generally asserted, on authority which still remains credible, that Mr. GLADSTONE, though he was slack in repressing outrage, yet regarded with tenderness the right of property as it was vested in unoffending landlords. If the popular belief was well founded, the long struggle on the Coercion Bill gave time for a total change of policy. The Land Bill, as it was framed and ultimately enacted, gave the tenants another large slice of the property of the landlords, though some optimists, including the PRIME MINISTER, believed that the great majority of landlords would be rewarded by exemption from further loss for the acknowledged justice and liberality with which they had administered their estates.

The conduct of the tribunals which have lately begun to dispose of all the landed property in Ireland has caused not only alarm, but astonishment. At the first sitting the Chief Commissioner proclaimed the startling doctrine that rents were to be so adjusted as to allow the occupier to live and thrive on the land. The Sub-Commissions, each consisting of a lawyer in small practice and of two irresponsible persons, sometimes tenant-farmers, have already reduced hundreds of innocent owners to ruin by arbitrary reductions of rent; and English partisans are not ashamed to quote their iniquitous decisions as proofs that the tenants have hitherto been intolerably oppressed. The landlords have no better security for the residue of their rents than for the payments of which they had been previously defrauded. At no former time has the condition of Ireland been more hopeless, and the infection of vicious legislation is already spreading to Great Britain. In parts of England and Scotland tenant-farmers are combining for the purpose of obtaining an Irish Land Act for themselves. Mr. GLADSTONE, as might be expected, encourages their agitation by the use of ambiguous phrases.

The revival of industrial and commercial prosperity which had begun in 1880 has not been interrupted, though another inclement season has prevented the removal of agricultural depression. A good harvest would have gone far to relieve the farmers, inasmuch as American importations have declined, and the prices of produce have been comparatively high. A large increase in the rate of discount, beginning about the middle of the year, may be in some degree attributed to the improvement of trade.

The demand for English products would be practically unlimited, but for the protective tariffs which are established in all other civilized States. A consequent sense of injustice has produced a mistaken agitation which is already subsidizing. The theory of Fair-trade, as it is called, requires the imposition of retaliatory duties on imports from countries which impose heavy taxes on English goods. Some dreamers have projected a Customs Union of the Mother-country and the Colonies, with perfect internal free trade and a high tariff against foreigners. Many of the promoters of the movement acted in perfect good faith; but they have not succeeded in obtaining numerous proselytes. Many years will probably elapse before the principles of Free-trade will be acknowledged on the Continent of Europe or in America. In the meantime England will derive great advantages from the possession of a sound commercial system. The natural irritation of the partisans of Fair-trade has combined with the more reasonable convictions of the mass of the trading community to inspire a wholesome vigilance during the negotiations for a renewal of the French Commercial Treaty. The English manufacturers have almost unanimously protested against the conclusion of any treaty which might be less liberal than Mr. CORDEN'S. At first their indifference to a settlement was received by the French Legislature with incredulity; but a desire for a treaty has grown among French economists in proportion to the backwardness of the English producers. The fate of the treaty is still uncertain; but the French and English Commissioners are believed to have agreed on all important points except the French duties on woollen goods.

The only foreign transactions which have been connected with English policy are the settlement of the dispute between Greece and Turkey, and the military mutiny in Egypt. In the French invasion of Tunis the English plenipotentiaries at Berlin had assented by anticipation to an indefinite extension of French influence in the Regency; and the French Consul, M. ROUSTAN, apparently chose his own time for carrying out a deliberate policy by suddenly requiring the Bey to suppress the chronic excesses of certain tribes on the Algerian border. The Bey, as had been anticipated, was unable to reduce the Kroumirs to obedience; and his default was punished by the forced acceptance of a treaty which abolished his independence. The French, after a few skirmishes, left the Kroumirs to themselves; but they have since found it necessary to employ a large military force in restraining the discontented tribes as far as the borders of the desert. The insurgents are totally unable to resist French troops, but they keep the whole country in alarm, and they frequently evade pursuit. M. GAMBETTA, on his accession to power, expressed his determination to maintain the treaty of Bardo; but he would perhaps be glad to be rid of an unprofitable acquisition. An adverse verdict given by a jury in an action for libel brought by M. ROUSTAN is supposed to indicate popular disapproval of the annexation of Tunis. The friendly relations between France and Italy have, for the present, been disturbed by the establishment in Tunis of exclusive French influence. It was in some degree as a protest against the unfriendly policy of France that King HUMBERT, in the late autumn, paid a ceremonial visit to Vienna. He was understood to solicit admission to the league between

Austria and Germany; but it is not known whether his overtures have been favourably received. The complications of Continental politics are inexhaustible; and it would seem that Prince BISMARCK, having suddenly resumed friendly relations with the POPE, is disposed to interfere on his behalf to improve his position at Rome. It is intelligible that foreign Governments should regret the abolition of the temporal power, so far as the POPE's territorial sovereignty rendered him liable to material pressure; but it is impossible for any Italian Government to relinquish its hold on Rome, and Prince BISMARCK can have no design of coercing Italy. An alliance of Germany with the POPE would, in spite of the complications at Tunis, throw back Italy into the arms of France. The projected abolition of the FALK Laws, and the appointment of a Prussian Minister accredited to the Vatican, are consequences of Prince BISMARCK's defeat in the recent elections. The family alliance with Russia has apparently not been disturbed by the assassination of ALEXANDER III. and by the accession of his son. The Emperors of GERMANY and RUSSIA held a meeting at Dantzic, in which they seem to have arrived at a political understanding. Since that time Count KALSOKY, who became Austro-Hungarian Foreign Minister on the death of Baron HAYMERLE, is supposed to have arranged a more formal treaty with the Russian Court; yet, according to the latest rumours, the relations of the Russian and German Governments have lately become less friendly. Internal troubles and anxieties will probably prevent the Russian Government from disturbing the peace of Europe.

The brilliant advance and the victory of Sir FREDERICK ROBERTS in the neighbourhood of Candahar were followed by the entire evacuation of the territory which had been occupied as far as Pishin. Some months afterwards AYOOB advanced from Herat to Candahar, and defeated one of ABDURRAHMAN's generals; but in a subsequent encounter AYOOB was defeated; and, Herat having been occupied by an officer of ABDURRAHMAN's, AYOOB took refuge in Persian territory. It is not yet certain whether the AMERR will be able to maintain his authority at any or all of the three capitals of Afghanistan. During the internal struggles the Russians appear to have advanced so far into the Turcoman country as to have procured the submission of the chiefs of Merv. The result of the most mortifying occurrence of the year is not yet fully known. The Transvaal has, in painful circumstances, been surrendered to the Boers, and for the present there is peace in South Africa. The death of Lord BEACONSFIELD will perhaps henceforth serve as a date for a great change in English policy. In no previous year has the progress of revolution been more distinctly visible. The accidental acquisition of the suffrage by a portion of the lowest classes of the community, through a scandalous blunder, has scarcely excited attention.

#### LORD JUSTICE LUSH.

THE death of Lord Justice LUSH terminates a long and honourable career. There has seldom been a better specimen of the barrister who attends to his business, who works hard and gets on by working hard, who sticks to his trade until he becomes master of it; or of the judge who gives his whole mind and his whole powers to getting properly through his duties, who knows what a judge ought to know, and who sits in the seat of justice in order to give justice of the best kind and in the best way that experience of men and law can suggest. In a calling where so many qualities and habits of the intellect may show themselves as in that of a judge, and in a sphere so singularly wide and varied as that of the administration of the law, there are sure to be found distinct types of judges, and each type may be admirable and excellent in its way. The two heads of the ordinary judicial body, Lord COLERIDGE and the MASTER of the ROLLS, add very greatly to the efficiency of the Bench, and attract a very large portion of the confidence of the public and of the Bar in the administration of the law. No men could be more unlike, and the special gifts for judicial work which they bring with them are very distinct and almost dissimilar; but they have one point of resemblance—that each is unique in his own way, and each turns his gifts and graces, or his insight and rapidity, to the work before him as he might have turned it to

other work. The man comes before the judge. Lord Justice LUSH presented a different type. In him the man was the lawyer; not that he was a legal pedant, or a lawyer with mere technical knowledge. On the contrary, he brought to the administration of the law a sound common sense, a just commiseration for suitors, an unflinching desire that the rules of law should be discovered to be what an honourable man who knows law, but who also knows the place of law in life, would wish them to be. No judge was ever more anxious that suitors, who each had something of justice on his side, should settle their differences before legal subtleties were argued out; and there was nothing he liked better than to make such suitors tolerably happy before they knew what was happening to them. A master of technicalities, he was never the slave of his knowledge. But he was throughout life a lawyer, and a lawyer who moved on in the old-fashioned traditional way. He worked his way up along a toilsome path from the bottom almost to the top. He did not enter the halls of legal triumph through any of their grand portals. He began by being a solicitor, was called late to the Bar, wrote a book on practice, and practised as a special pleader; he was then a very hard-working junior, and next a hard-working Queen's Counsel; and, lastly, for fifteen years, a hard-working Puisne judge. He was never in Parliament, he never electrified a jury or any one else. But he knew his business, stuck to his business, and was at last made a Judge of Appeal because it became quite impossible that he should not be made one. It would be too hazardous to say that all judges ought to be of this type; but it is very safe to say that the judicial body would little satisfy the legal profession and the public unless it contained a large admixture of judges like Lord Justice LUSH.

The Judge whose death is now widely and sincerely deplored had been longer on the Bench than any other judge. The calling of a judge seems to be healthy one, and several of the judges are advanced in years; but the date of the LORD JUSTICE's appointment was anterior to that of any of his colleagues. In sixteen years all who sat with him had been made judges, and many of them had been appointed very recently. During the existence of the present Ministry not a single English see has fallen vacant; but no fewer than six ordinary judges have been appointed, and four ordinary judges have been made judges of appeal. Besides the vacancy in the Appeal Court created by the death of Lord Justice LUSH, there is also vacant the post of a third paid Law Lord. Two very high positions, therefore, have now to be filled up; and if promotions are made from the existing Bench, there will be other vacancies to be filled up among the ordinary judges. If to be made a judge or to be promoted is happiness, then the Government has made ten persons happy, and it may, if it pleases, bestow happiness on four others. And yet it has not been two years in office. This shows an extraordinary flow of legal advancement, and ought to be most gratifying to the Bar. There will probably be somewhat of a pause in the current soon, for the places created by recent legislation will have been filled up, and many of the newly-appointed judges are comparatively young men. But the flow must always go on with a fairly strong force, for the judgeships are now many, and the date of Lord Justice LUSH's first appointment shows that within a moderately short space of time vacancies must occur. Leaders at the Bar and those who have attained eminence in some way without being exactly leaders have, therefore, a good time before them. Business is said to be slack at the Bar just now, and clever men who feel that they ought to be making more money deplore a state of things which they think is hardly worthy of a great commercial country. But the business of being a judge was never brisker than it is now. And, whatever may be said in public, there can be little doubt that there are very few barristers who are not pleased to secure the offer of a judgeship, and who are not still more pleased and proud if they can say that they have received the offer and refused it. The occupation of a judge is at once agreeable, dignified, and healthy. On this last advantage of their position the judges lay peculiar stress. They are allowed four and a half months of clear holiday in a year, and they declare that they could not get on with a day less. That is about the minimum of complete leisure which a man, occupying an agreeable and dignified position, must enjoy

if he is to keep perfectly well and bright. With this liberal provision for continued health and spirits, they feel that a judgeship is a position which they have done themselves no wrong in accepting, and which they can recommend to their aspiring friends with complete good faith.

It is sometimes however thought, and more frequently perhaps said, that judgeships may be very good things to get, but that there are now so many of them that there will soon be a dearth of barristers fit to get them. Those who are of this opinion may study with advantage the career of Lord Justice LUSH. He was by common consent an excellent judge; but it cannot be said that he in any way lifted himself out of the ordinary groove of his profession. He was not in Parliament; he had been many years a Puisne judge before he was made a Judge of Appeal. He rose as any barrister of ability may rise, and he won his way to the Appeal Court by long slow hard work. If this is the road along which barristers have to travel in order to die with the reputation of having been excellent judges, there ought not to be any great deficiency of competent travellers. There are many reasons for thinking that it will in the future be easier than it has hitherto been to follow in the steps of Lord Justice LUSH. Purely professional qualities have more and more attention paid them. The connexion between the Bar and politics grows less and less. Parliament is not now the recognized avenue to the Bench that it used to be. Ten of the existing judges have been appointed in the last four years, and out of the ten only two were ever in the House of Commons. It may even be doubted whether a barrister does not now lessen rather than improve his chances of a judgeship by entering Parliament. If he stays outside, his appointment cannot be denounced as a political job, and he cannot have to vacate a seat which the Government might fear to lose. And, while the Bench is becoming less political, the chief legal Parliamentary offices are becoming more political. The law Officers are much more politicians who take semi-legal places in the Government than lawyers who occupy semi-political appointments on their way to the Bench. Possibly, in time, the Chancellorship may undergo a similar transformation; and the Chancellor will be regarded, not as the head of the law, but as a peer who for the time being imports some general acquaintance with law into the counsels of the Cabinet. The sphere of political lawyers will thus become a different sphere from that of non-political lawyers; and, in the sphere of non-political lawyers, Lord Justice LUSH surely set an example that may be followed, and reached an eminence that may be rivalled, if only those who come after him will do their work from the day of their call to the day of their death as steadily, as laboriously, and as sensibly as he did.

#### M. PAUL BERT AND THE BISHOPS.

M. PAUL BERT is evidently determined that the Church shall not forget what sort of ruler she has over her. The bishops are now to taste in their own persons some of the sweets of that surveillance to which they are supposed to have subjected their clergy. The Minister has directed one of his subordinates to obtain from the Prefects minute information as to the character, antecedents, and habits of the bishops. That M. BERT should wish to enlarge his knowledge upon these points is natural enough. A bishop is to him a perfectly unknown animal, and, as so long as he remains Minister of Worship he will have to maintain some kind of relations with bishops, it is indispensable that this omission in his political education should somehow be filled up. M. BERT finds himself inconveniently in advance of his age. Until lately he had probably looked forward to being Minister in that happy future when churches and religions shall be no more; and when, if bishops have to be studied at all, it will be from specimens preserved in spirits, not from the living subject. Fortune has called M. BERT to greatness while this beneficent process is still incomplete. Instead of having to build on the ground from which the Church has been cleared away, he has himself to take a hand in the process of demolition. Bishops still cumber the ground in all directions, and, much as he himself may long for the time when they shall do so no longer, he has to wait for M. GAMBETTA's bidding before taking measures to get rid of them. All that is left to him therefore is to make the lives that are still left to

them as uncomfortable as possible. This is a part which M. BERT is very well able to play. The direction to the Prefects to keep a sharp eye on the bishops, and to subject their words and actions to the kind of scrutiny which a detective policeman brings to bear on a suspected criminal, is sufficiently annoying to men who, down to a very few years back, were at least as important personages in their dioceses as the Prefect himself. The mere sense of being watched is unpleasant, and to be watched by an equal to whom you have suddenly been made subordinate is especially disagreeable. This last feature in the case is carefully brought out by the friends of the Government in the press. They defend M. CASTAGNARY's circular on the ground that it involves no new principle. The Prefects, they say, have always been in the habit of keeping the Minister well informed as to the merits and demerits of their subordinates. How else can the Minister know whom to promote and whom to leave where he is? The point of M. CASTAGNARY's circular lies in the fact that it extends to bishops a kind of inspection which has hitherto been only applied to the officials responsible to the Prefect. It treats them for the first time as the Prefect's subordinates. Even the motive alleged for the issue of the circular has a sting of its own. The bishops know that vacancies in the higher ranks of the hierarchy are filled up by the Government, but they do not wish to be reminded that their promotion depends on M. BERT's pleasure. This is precisely the kind of reflection that brings their position home to them in the most unpleasant manner possible. M. GAMBETTA's choice of a Minister of Worship is thus completely justified. He wished to make the clergy pass under the yoke, and while M. BERT is their superior there is no fear that any incident of the process will be excused them.

Some wonder has been expressed at the indiscretion which allowed the existence of this circular to become known. It is safe, however, to say that it was written in order to become known. M. BERT had no need to put his desire for information about the bishops on record in this formal way. If the information itself were the thing he valued, he could have obtained it without difficulty and without noise. He need not even have committed the wish to writing. A French Prefect is seldom slow at taking a hint, and it would have been quite enough for the Minister to mention in conversation that it would be convenient to know anything that could be got together about the bishops to ensure ample information. It is allowable therefore to suppose that something more than information was wanted. The annoyance to be given to the bishops in the course of obtaining the information was contemplated beforehand. If M. BERT could at once have been supplied from the pigeon-holes of the Ministry of Worship with all the facts he wanted, he would still have directed M. CASTAGNARY to send out the circular. The policy which underlies this step—the policy of irritating and humiliating the clergy in the most conspicuous way possible—is evidently one which M. GAMBETTA has deliberately adopted. The Church is to be placed under a kind of official excommunication. To be her servant is to be counted as a sufficient disqualification for the service of the State. Even the village schoolmaster must not in future act as bellringer or sacristan in the village church. He must decide which post he will retain, and abandon or be dismissed from the other. The Church is a public enemy; and, except in the case of M. BERT, who is compelled by the terms of the Concordat to go through certain formalities of intercourse, all who associate themselves with her must expect to be treated as public enemies. As yet, however, it must be observed that no positive harm has been done to the Church. Insult has not so much been added to injury as it has taken the place of it. M. FERRY was a more active enemy than M. GAMBETTA has yet shown himself, though M. GAMBETTA is probably regarded by all except the very few who are in the secret—if there is any secret to be in—as by far the more formidable adversary. It is still possible, therefore, that the notion that M. GAMBETTA deliberately intends his bark to be worse than his bite may prove to have truth in it; and that, though M. GAMBETTA is bent upon making the lives of the French clergy burdensome, he intends to be content with this. The advantage of such a course is that it enables him to keep his radical supporters in good humour without breaking with the traditional policy of France, where the external interests of Catholicism are concerned.

He has to be a protector of Catholicism in Tunis and Algeria, and considerations which he cannot disregard may make it important not to be on very bad terms with the POPE. How is he to bend to these necessities without alienating his Radical supporters at home? Only by giving these supporters the pleasure, which they value so highly, of seeing a bishop baited. In the strength of this refreshing meat they may perhaps endure to see the Nuncio asked to dinner and the French Minister at the Vatican instructed to be courteous to the POPE.

The restoration of the oath which under the Concordat ought to be taken by bishops on their appointment to a see, if it is really intended, is another move in the same direction. It is quite impossible that M. GAMBETTA should suppose that there is any safety in oaths. He has seen too many taken and broken to have any illusion left upon this point. Many of the higher officials who now serve the Republic were originally servants of the Empire, but the allegiance they swore to NAPOLEON III. has not stood in the way of their duty to the powers that be. An oath "to remain obedient and faithful to the Government" established by the Constitution of the French Republic will only remain binding as long as there is a French Republic to be obeyed; and the most ardent rebel usually succeeds in persuading himself that public tranquillity and the welfare of the State will in the long run be promoted, not impaired, by the removal of the particular rulers against whom he is conspiring. There is irony enough in the fact that this very oath to maintain the Republic was imposed on the bishops by the first NAPOLEON. But an oath may be useless without ceasing to be distasteful, and it is in the latter quality that the explanation of its revival should perhaps be looked for. The bishops are suspected, to say the least, of cherishing a concealed dislike of the Republic, and to remind them that they have taken an oath to remain obedient and faithful to it, and to inform the Government of anything occurring in their dioceses to the prejudice of the State, will be a ready method of annoying them when nothing else happens to be at hand. By what process M. GAMBETTA has convinced himself that this method of treating the greatest and most conservative of French institutions can ultimately promote public tranquillity is not known. Perhaps in the hurry of taking office he has not found time to put the question to himself.

#### THE BRIBERY SENTENCES.

THERE could be little doubt as to the answer which Sir WILLIAM HARCOURT would return to the memorial in favour of the persons convicted of bribery. Having in the last Session introduced a Government Bill for the aggravation of the punishment of the offence, the members of the Cabinet could not be expected to admit that the existing penalty was excessive. An immediate remission of the sentences would have operated as a censure on the judge who had deliberately inflicted a severe penalty on undoubted offenders against the law. That the HOME SECRETARY is not unwilling to reconsider the sentences on grounds of humanity has already been proved by the release of one of the misdemeanants who had become seriously ill in prison. If there should be grounds for similar clemency in any of the other cases, it will be better that any partial mitigation of punishment should not be made under pressure. That the moral guilt of the prisoners is not, in general estimation, deemed proportionate to the legal consequences of their acts seems to be amply proved by the extraordinary depth and extent of the feeling which has been excited by the sentences. In addition to a much larger number of memorialists holding good social positions, more than a hundred members of the two Houses of Parliament, three hundred bankers, and between three and four thousand solicitors have signed one or other of several memorials which were presented to the HOME SECRETARY. No attempt was made to suggest the innocence of any of the prisoners, and the memorial included decent phrases in formal condemnation of the offence of administering bribes; but it is certain that the memorialists, while they were chiefly actuated by personal compassion, really disbelieved in the gravity of a crime which has been created by legislation. Bribery at elections is, on any tenable theory of representation, wrong in itself, and it is still more certainly illegal; but the whole community is conscious that its horror of the practice is more or less

hypocritical and capricious. Votes ought to be given with exclusive regard to the public interest; but in the great majority of instances the practice is remote from the ideal standard. There are even worse methods of corruption than the distribution of sovereigns.

The same virtuous Government which proposes to add hard labour to imprisonment as a penalty of payment for votes has lately profited by one of the most disgraceful appeals to the cupidity of voters which have ever been employed by the most unscrupulous of election agents. The Committee or the supporters of the Irish SOLICITOR GENERAL at the late election for Derry issued placards with lists of rents reduced according to the scandalous practice of the Land Act Sub-Commissioners, with an intimation that similar boons would be secured by tenant-farmers if they voted for Mr. PORTER. It is highly probable that these corrupt incentives, which seem not to have been repudiated by the candidate, tended to secure his return. His colleagues and superiors welcomed his victory without expressing any remorse for proceedings which were morally equivalent to bribery. The Ministers, indeed, cannot afford to inquire too closely into the means by which many of their followers obtained seats in Parliament. Some of the constituencies which contributed to the Liberal majority sold their votes almost as openly as the electors of Sandwich or of Macclesfield. The equally guilty consciences of both political parties sometimes deterred the losers from petitioning, and consequently secured them against troublesome inquiries. The electors of Derry sold their suffrages at a higher rate, for borough voters seldom obtain a price equal to twenty-five or thirty per cent. of an average Ulster farmer's rent. Even the most immaculate of Ministers has not always abstained from the suggestion of sordid or selfish motives. In 1874 Mr. GLADSTONE promised to repeal the Income-tax if the constituencies would renew his lease of power. If the electors in general had responded to his offer, there can be no doubt that they would have voted in consideration of a pecuniary advantage to themselves.

It is possible that severity of punishment may tend to create an artificial public opinion in condemnation of bribery. For the present, the unexpected sentences which have been passed seem to have produced an opposite effect. The forty thousand memorialists who approached the Home Office were probably disposed to find excuses for acts which they nominally allowed to be culpable. It is at least certain that they were more impressed with the assumed injustice of the penalty than with the guilt of the misdemeanants. To ordinary persons it seems shocking that a solicitor or town councillor should be compelled to wear a prison dress and live on prison fare, while his equals, who are known to have been engaged in similar practices, find that their social position is not affected. Rich and zealous Liberals who, like the corresponding section of the opposite party, subscribe large sums to be employed at every general election, must strongly suspect that the application of the funds which they provide is not always consistent with absolute purity. There are, indeed, legal expenses to be incurred; but the money passes through the hands of subordinate agents, who may not be inclined to lose an election for want of a moderate sum. Not a few boroughs are, with more or less success, "nursed," as it is called, by neighbouring aspirants to Parliamentary honours. The constituencies which profit by the continuous liberality of intending candidates are not morally distinguishable from their neighbours who sell themselves for a lump sum. As long as respectable politicians of both parties connive at such practices, it will be difficult to persuade ordinary persons that a distributor of bribes is on the same moral level with a thief or a forger.

It is contended by the advocates of severity that the admitted confusion and uncertainty of opinion requires to be corrected by a strict administration of the law, if not by the imposition of additional penalties. It is conceivable that such experiments might have the effect of diminishing, if not of abolishing, the grosser forms of bribery. In such a case a definite advantage would have been obtained, but many of the evils which seem to be inseparable from a system of popular representation would remain. A purchased vote indicates no preference for one candidate over another, and no belief in any political principle; but the bribable voter, even if he were prevented from actually receiving bribes, would still, as before, have no disposition to recognize merit or fitness. It is difficult to conjecture the

grounds on which the constituency of Macclosfield would vote in the absence of bribes, if their borough were not disfranchised. The chances are that their paymasters on either side have ordinarily been equal in patriotism and ability, and that they could only be distinguished by their comparative spirit in bidding at the electoral auction. When no money was forthcoming, the voters would probably prefer, in default of other reasons for choice, the most fluent demagogue. Their appetite for illegitimate gains would be directed to general projects of spoliation, instead of to personal corruption. It is impossible to make men honest, intelligent, or public-spirited by penal legislation; but perhaps one corrupt motive among many may be gradually eliminated. At the next general election the business of administering bribes will pass into the hands of humbler agents. There will be a large number of additional claimants in virtue of their occupation of rooms in common lodging-houses. By an odd accident the same Judge whose sentence has produced a reaction in favour of bribery came about the same time to the conclusion that Parliament had, without knowing it, suddenly enfranchised nearly the whole male population of the boroughs. This decision was afterwards limited in its scope and effects, but to a considerable extent it was confirmed. It is not to be expected that the poorest part of the population, unexpectedly invested with the franchise, will refuse in all cases to sell their unfamiliar votes. It may also be predicted that they will find willing customers.

#### THE POPE AND ITALY.

THE precise authorship of the pamphlet *Il Papa e l'Italia*, which has recently appeared at Rome, is not of much consequence. It is pretty certain that it contains, if not the POPE's last word on the relations between himself and the Italian Government, at least the particular word which he thinks it expedient to say at the present moment. Perhaps it will be doing the writer no injustice to assume that his object is rather to show the difficulties that surround the maintenance of the present state of things in Rome than to bring about the adoption of the particular proposal recommended in the pamphlet. That this proposal would in itself be a reasonable one may be admitted. It is very much to the interest of both the Powers concerned that they should devise some means of living peaceably side by side, and no expedient would be so effectual—supposing that it were possible to resort to it—as the transfer of the seat of Government to Florence. Rome could then resume the place for which history and the course of events have fitted her, and become the ecclesiastical capital of the Catholic world. The whole temper, however, of the Italian people is opposed to such a compromise as this. It is hardly too much to say that to the Italian Radicals Italian unity was dearer for that which it destroyed than for that which it created. To make Rome the seat of Government was to declare that the world of which it had so long been the capital had ceased to be. Any compromise which lessens the force of this triumph would encounter violent and probably successful opposition from the whole Radical party. With the franchise what it is, even its acceptance by the majority of the Legislature would be by no means conclusive as to its popularity in the country, and the Cabinet which proposed it might only find that it had made its own continuance in office impossible.

If, however, the expedient suggested by the writer of the pamphlet must be rejected as impracticable, he has no difficulty in showing that the expedient actually adopted by the Italian Government is inadequate. The "Guarantees," he says, guarantee nothing. They have been given to the POPE by a Government which was free to withhold them, and is equally free to recall them. Liberty which rests on no better foundation than an Act of the Legislature is no liberty at all. A vote has made it, and a vote can unmake it. This is the objection to the theory of a Law of Guarantees; but there is a further objection in the fact that recent events have shown that the Italian Government is too weak to give effect to the statute, however anxious it may be to do so. A living POPE is not likely to evoke less enmity than a dead one; and, if the authorities could not secure for the body of PIUS IX. an uninterrupted and honoured journey to its last resting-place, what chance is there that LEO XIII. would meet

with more respectful treatment if he went in and out as of old among the Roman people? If the law were technically inadequate, some little weakness on the part of those whose business it is to enforce it might be put up with. If it had been carried out to the letter, its technical insufficiency might be passed over. But, when it is worthless alike on paper and in action, it is impossible for the POPE to put any trust in it. There is really no answer to this reasoning. The Italian Radicals are hewn out of the same block as the French Radicals. Their dislike of the Papacy is not a mere languid feeling evoked by the recollection of the wrongs it has done them in the past. They hate it for its virtues at least as much as for its faults. Of the two, they were more ready to tolerate PIUS IX. than LEO XIII. The one, they felt, was doing something at every turn to embroil the Church with the temporal Governments of Europe; the other is prudent, conciliatory, and anxious to be on good terms with all the Powers with which he is brought in contact. PIUS IX. needed only to be left alone to ensure that he would somehow make things worse for himself; LEO XIII., if he were allowed to go his own way, might end by convincing the Italians that their temporal interests would be best served by a frank understanding with the Vatican. Supposing that the French Legislature had passed a Law of Guarantees when Marshal MACMAHON was President of the Republic and the Duke of BROGLIE Prime Minister, what chance would there be of its maintenance now that M. GRÉVY is President and M. GAMBETTA Prime Minister? A steady progress in the direction of Radicalism is no more impossible in Italy than it has proved to be in France; and, if the Extreme Left were once in power, the POPE's title to the honours and immunities of a sovereign prince would not be worth an hour's purchase.

It is not the purpose of the writer of the pamphlet to indicate any means by which the system of guarantees could be strengthened. He wishes to show by a process of exhaustion that the only possible way out of the deadlock in which things at present are lies in a Concordat between the new Italy and the Roman Church which shall secure to the POPE the liberty which Catholics everywhere desire for him by giving him back his sceptre. But to ask one thing with a secret intention of accepting another is not an unknown process in diplomacy; and it would not be surprising if the author of this pamphlet and those in whose interest he writes were more bent upon proving the offers embodied in the Law of Guarantees to be illusory than upon rejecting all proposals to make them real except the one actually suggested in its pages. There is a third expedient which is not open to the objections which are urged with so much force against the adequacy of the Law of Guarantees and the possibility of restoring Rome to the POPE. What is it that makes the guarantees so worthless in the eyes of LEO XIII.? The fact that they have no sanction beyond a Parliamentary vote which may any day be rescinded. Consequently, if they could be invested with some sanction which is not dependent on a Parliamentary vote, the ground of the Papal objection would be removed. The only way in which this additional sanction can be given is by making them rest not on statute, but on treaty. No doubt, even a treaty can be denounced, but only if the Power denouncing it is willing to run all the risks which such a step may carry with it. Ordinarily speaking, rights which are secured by an international instrument are beyond the reach of municipal legislation. Of course even an international instrument may go for nothing, if none of the parties to it are disposed to enforce its due execution. The liberty which the Law of Guarantees professedly gives to the POPE might be secured to him by a treaty between Italy and certain other Powers, and yet, in the event of this liberty being violated by the Italian Government, none of the other signatory Powers might choose to interfere. But the solution recommended by the writer of the pamphlet is open to an almost identical objection. Supposing that the city of Rome, together with some fragment of the surrounding country, were restored to the POPE, his possession of it must remain in the highest degree precarious, unless it were secured by something in the nature of an international arrangement. Without such an arrangement the POPE would be as much at the mercy of the Italian Government as he is now. The territory, like the guarantees, would have been freely given, and might be capriciously taken away. The only way to make a *modus vivendi* enduring is to invest it with some kind of authority

which the Italian Parliament cannot annul of its own mere motion. It may be impossible, of course, to create such an authority; but, supposing it to be created, it would be far easier to affix it to a Law of Guarantees than to a cession of territory. Where either expedient would secure the POPE's independence, that which is easiest to bring about is plainly the best to labour for. It is true that the Italian Ministerial papers profess to regard both proposals as equally impossible. The Italian Government will not tolerate, they say, any kind of foreign interference between itself and the POPE. But the present relations between the two Powers are of a kind which can hardly be more tolerable to Italy than they are to the POPE. So long as the Church is hopelessly estranged, the State must forego the support of the greatest of conservative forces. There is only one of the Italian parties that can profit by this state of things, and that is the party which regards the KING as only one degree less hateful than the POPE.

#### MR. SHAW AND HOME RULE.

MR. SHAW'S temperate and argumentative letter more than justifies his refusal to join the resuscitated Home Rule League, and it contains almost as conclusive an argument against the Association known by the same name of which he was once the nominal leader. Mr. SHAW hints, if he does not expressly assert, that the present League is formed for treasonable purposes, and also as a substitute for the Land League while that organization is violently suppressed. No loyal subject, no friend of order or justice, will join any League for effecting political changes "while the country is excited by wild and impracticable schemes, while social ties are loosened, and while dastardly crime is stalking through the land." Mr. PARNELL has never made a secret of the connexion between the system of agrarian plunder which he has promoted and the ulterior political revolution which, as he hopes, will follow. The extermination, or even the impoverishment, of the owners of land will have annihilated the class which is most closely identified with the Union. Mr. SHAW, indeed, believes that the tenant-farmers, the tradesmen, and the middle class in general would oppose separation if they thought that it was imminent. The reasons for his judgment are not stated; and it is not improbable that Mr. PARNELL's calculation would be justified by the result. It is certain that the Home Rule League is, at the present time, bitterly hostile to England and to all the Irish supporters of union. The fiction of a federal relation between the Empire and a self-governing Irish State is wholly obsolete. As Mr. SHAW says, the agitation is directed, not to the attainment of local self-government, but to the establishment of an Irish Republic, which, it may be added, would habitually ally itself with any foreign enemy of England.

No English politician, with the exception of Sir WILFRID LAWSON, has thus far professed to regard the disruption of the United Kingdom as an open question; and yet no less definite issue is raised by the agitation for Home Rule. As long as an indefinite demand for something which was designated as Home Rule was preferred by Mr. BUTT, Mr. SHAW, and their associates, it was possible to believe, or to pretend to believe, that a local Legislature was compatible with the sovereignty of the Imperial Parliament and with the prerogative of the Crown. The Irish voters in English boroughs were instructed to support candidates who promised to vote, not for the concession of Home Rule, but for an inquiry into the merits of the scheme. In other words, those who truckled to the agitation admitted that Home Rule was an open question. The most conclusive arguments against the project were repudiated under the influence, in almost every instance, of corrupt personal motives. Several members owe their seats to compliance with the demands of the Irish demagogues, and some candidates suffered for their dishonest subserviency through the just offence which it gave to the genuine constituency. It is probable that hereafter even corrupt politicians will abstain from this particular malpractice. No votes are for the present to be got by adhesion to the project of an Irish Republic; and a proselyte to Home Rule in its latest form is pledged to no more moderate scheme. It may be admitted that Irish agitators have only disclosed a transparent secret in deducing the logical conclusion from the doctrine of Home Rule; but it is always possible to affect belief in a political fiction

where anything is to be got by wilful credulity. The Home Rule movement with which Mr. SHAW properly disavows his connexion will be useless, and indeed inconvenient, to English Radicals. Some of them may, like Mr. SHAW, cultivate a conventional belief in the possibility of extending the local independence of Ireland without weakening the connexion with England; but no such scheme would command the popular support which was given to Home Rule when the phrase was understood to mean much more than it expressed.

Mr. SHAW's explanation of the abandoned Home Rule scheme is not remarkably clear. "The Federal plan," he says, "as adopted by the Conference of 1873, was a compromise. It was believed in by many, by others adopted as a fair mode of meeting a great difficulty . . . but there were others, and among them active and influential men, who joined the Association with the view of using it as a means of working out much more extreme ends; and even before Mr. BUTT's death it was evident that these gentlemen had attained complete ascendancy in its councils." The great difficulty which was to be evaded by the Home Rule theory was no other than the proverbial impossibility of keeping the door at the same moment open and shut. The Federal project was in substance the restoration of the form of government which existed, with the episode of the rebellion, from 1782 to 1800. An Irish Parliament of Lords and Commons was to occupy itself with internal legislation and administration, without interfering in Imperial affairs. The Irish were to be separately represented as at present in the Imperial Parliament, which was to retain the control both of foreign affairs and of legislation for Great Britain. In the last century a not wholly dissimilar arrangement was with difficulty maintained for a few years by means of wholesale corruption. It was at last found necessary to buy up Irish patriotism once for all instead of paying annual subsidies. Mr. BUTT's Parliament was to be subject to certain limitations which were not imposed on GRATTAN'S Legislature of 1782; but it is not surprising that many nominal supporters of the scheme knew that its practical operation would be impossible. The active and influential gentleman who superseded Mr. BUTT and Mr. SHAW in the conduct of the Home Rule movement only interpreted its true meaning, and anticipated its results. It was quite certain that an Irish Parliament once legally assembled would have assumed sovereign independence, in total disregard of any constitutional compromise. It is difficult to give Mr. BUTT credit for a sincere belief in the possibility of his proposed division of power. That he was not in earnest is rendered more probable by his proposal that the local Parliament should consist of Lords and Commons, although he well knew that not a single Irish peer was prepared to acquiesce in Home Rule. There was in truth little difference of opinion between the projectors of the scheme and their English critics and opponents. All serious politicians on both sides understood that Home Rule, then as now, was equivalent to separation. For a time it was thought expedient to indulge in rhetorical flourishes about the golden link of the Crown. The alternative of an Irish Republic is now more candidly substituted.

It fortunately happens that the English Constitution allows of no devolution of sovereignty. Parliament is absolutely and necessarily supreme; and consequently it has abdicated its functions in preference to dividing them, when it has, as in the case of the Colonies, been found necessary to recognize local Legislatures. The independence which is claimed by Irish agitators is already possessed by Canada, by Australia, and by the Cape. Unless it were proposed to render Ireland equally independent, it would be impossible to concede Home Rule. The present Government will probably persist in trying a perverse experiment which was announced at the beginning of last Session. As if Ireland were not already ungovernable, Mr. GLADSTONE and Mr. FORSTER proposed to confer large additional powers on assemblies, to be locally elected, which were to assume the functions of the grand juries as one of the purposes of their organization. The gift of legal authority to the factious representatives of a disaffected populace would be a gross and criminal blunder. If the Government multiplies the resources of its implacable adversaries, it will not have erred for want of warning. The bestowal of the freedom of the city on the ringleaders of sedition by the Dublin Town Council may perhaps be delayed, or even prevented, by technical difficulties; but in several divisions of

majority has approved the proposal for the purpose of sanctioning anarchy and spoliation. The Boards of Guardians throughout the country are centres of agitation, and some of them are little better than Committees of the Land League. Perhaps at the time when the new measure was announced the Government would not have objected to facilitate by legal recognition the operations of the League. Mr. CHAMBERLAIN has once more eulogized its purpose and its early action in the strongest terms, although it was occupied with the arbitrary withdrawal of rents, through the machinery of outrage, mutilation, arson, and murder. As late as the time of his visit to Leeds Mr. GLADSTONE hesitated to condemn the organization which had not yet been openly employed to discredit the Land Bill. Both Mr. GLADSTONE and Mr. CHAMBERLAIN have now made up their minds that the Land League must be suppressed; yet the Government scheme would provide the League in every district with a recognized council of direction, and perhaps with funds to be levied by local taxation. The little rural Parliaments would prepare the way for an Irish Legislature; and in the meantime they would, each to the extent of its power, perpetrate unqualified mischief.

#### AMERICAN MEAT.

THE price of meat is generally recognised as a point of great importance; but its importance is ordinarily regarded from the point of view of the housekeeper, and as affecting favourably or unfavourably the total of weekly bills. Its real importance is, however, of a much wider kind. On it depend, in a large measure, the fortunes of the greatest of English industries—that of agriculture—and, so far as it determines the rate of wages, the power of English manufactures to compete in the markets of the world. The importations from abroad, amounting to about thirty per cent. of the total consumed, keep down the price of meat in England, and half of the meat imported comes from America—that is, from the United States and Canada. Anything, therefore, which tends to show what is the price at which American meat can be supplied here, whether this price is likely to be still further reduced, or whether there is likely to be a permanent rise on the prices hitherto obtained, is full of interest to producers and consumers alike. A correspondent of the *Times* has recently contributed a carefully drawn and instructive statement on the subject. To those acquainted with agricultural literature there is not, and there could not be, much that was new in his statement. It would be difficult for any one to add much to the evidence given by Messrs. READ and PELL and by Mr. ROBINSON to the Richmond Commission; but the correspondent of the *Times* gives some facts of a later date, and puts some details in a very clear and succinct form. He is able, for example, to assure us that, although much meat has come over this year from America, there have been great losses in the trade. It is at present a very speculative business, and the speculation, if this year it has answered in some cases, has failed in others. The Americans, too, are just as much exposed as we are in England to adverse seasons; and last winter, which in America was very long and very hard, injured the condition of cattle and considerably raised the cost of keep. Still, experience has shown what is the average sum for which American meat, dead or alive, can be brought into the English market. The statistics given in the *Times*, which are quite in accordance with the evidence given to the RICHMOND Commission, enable us to trace the financial history of an American beast from the cradle to the grave; and it is the study of this financial history which is the basis of all sound calculation as to the future price of meat and the future profits of English farmers. If a rise or fall is anticipated in the price of meat, the estimate, to be effective, must point to a probable rise or fall at one or more points of this financial history. The first thing, therefore, is to have a clear notion as to the periods at which additions are necessarily made to the cost of the animal before it gets into the hands of the English meat-seller. Whether the seller gets more or less than a fair profit on the transaction is a different question. There may or may not be a trade combination among butchers which unduly raises prices to the consumers. But the butcher only gives the English farmer the price which, after American competition has produced its effect, he is obliged to give him, and after he has got his profit the butcher reduces

the price to the consumer in proportion to the reduction he has himself been able to get on the cost of the animal.

Ranchmen, we are told, west and south of the Mississippi, after allowing for capital invested, and expenses of herding and losses, estimate that their cattle cost them 8s. a head per annum. A beast, therefore, represents to the grower, when it is three years old, an outlay of 24s. When it gets to Liverpool it represents an outlay of 19l., and the steps by which this very great increase is reached are as follows. The first stage is that of getting the animal to the nearest railway, and selling it to the purchaser who there receives it. The grower has some outlay in getting the animal to the station, and expects a profit of 50 per cent.; so that, by the time the bullock is delivered at a railway station, he is worth 2l. By the time he gets to Chicago the cost of railway transport for perhaps a thousand miles, and the cost of feeding and tending on the way, have raised his value to 3l. 10s. But before he is fit to export he must be sent to one of the middle or Eastern States to be got into condition. It takes 1l. to send him there, and no less than 8l. 15s. to keep and to fatten him when he is there, so that when he is ready for exportation he has cost 13l. 5s. Another 25s. takes him to New York, so he now has reached the point of 14l. 10s. It takes 4l. 10s. more to get him to Liverpool—the items of this total being 2l. for freight, and 2l. 10s. for feeding, tending, and insurance. These are the stages by which the animal, worth 2l. at the nearest State in the far West, has risen to 19l. at Liverpool; and if the animal is in fairly good condition on arrival, and has, while fattening, put on a reasonable amount of meat, 19l. as his cost means that the meat can be sold without loss at 5½d. per lb. The quantity to be sold will perhaps be 750 lbs., and if it is sold at 6½d. per lb. the profit is very nearly 4l.; and this, it appears, is considered enough to remunerate the vendor after all the trouble and all the expense which the animal has cost at various stages of his career. He would be worth more if he could be kept in England to wait a favourable turn of the market. But, as the United States is an infected country, he must be slaughtered in fourteen days. Canada is not an infected country, and therefore a Canadian animal of the same quality is worth more in the English market than an American animal; but it costs considerably more to get him there, as freight from Canada is higher. This is partly due to the more stormy nature of the Canadian passage. But it is partly due to another cause, which also determines the port at which most of the cattle from America are landed. The great centre of consumption is London, and yet they are landed at Liverpool, although the railway charges from Liverpool to London have to be paid. The reason is that Liverpool is the great centre of the American trade, and shippers can get a return cargo from Liverpool more easily than they can get it from London; while the trade with the United States is so much larger than the trade with Canada that it is more difficult to get a return cargo to Montreal than it is to get a return cargo to New York. Then, again, although the cost of railway transport from Liverpool to London is paid on American cattle, it must be remembered that English meat has also to be brought by railway to London, and the rates charged on English meat by the railway Companies are higher than those charged on American meat. How this happens was explained to the RICHMOND Commission by Mr. TWELVETREES, the Assistant Goods Manager of the Great Northern Railway. The meat of the animals slaughtered at Liverpool on their arrival from America is so packed that it entirely fills the carriages which convey it. English meat has to be collected at different stations, the railway managers cannot tell how much they will be required to convey, and the carriages appropriated to its conveyance are often only half full.

Similar calculations may be made as to the price at which meat from animals slaughtered in America can be sold at a profit in England, and a reasonable profit can be obtained with a less sum obtained per pound, many of the risks and much of the cost of ocean transport being avoided. So many elements of uncertainty enter into the calculation that it is impossible to speak with perfect confidence; but it seems tolerably safe to say that dead meat can be sold profitably at a penny per pound less than the profitable market price of

live meat. Probably a large portion of the dead meat brought over is sold to the consumer as if it were live meat; and then the butcher, or the importer, or some one, puts an extra penny per pound into his pocket. But it is not in itself worth so much. Frozen meat is excellent and perfectly wholesome, but it is not so good as meat that has not been frozen; and, if Mr. ROBINSON'S evidence may be trusted, the meat from the animals slaughtered on their arrival in Liverpool is better than the dead meat imported from America, because the dead meat has suffered inevitable injury from being knocked about during its transport across the sea. Dead meat can be sold at a penny per pound less, but then it is probably worth a penny per pound less; and, apart from tricks of the trade, it is the price of imported live meat that determines the competition which the English farmer has to meet. And consumers who wish to understand what this competition is must beware of judging by what they themselves pay for the prime joints to which they are accustomed. The price of prime joints remains very high because the demand for prime joints exceeds the supply. England is so rich that the number of persons who want legs of tender well-fed mutton and soft juicy steaks is almost unlimited. They fight among each other and keep up the price of prime joints, but the rest of the animal is sold at a lower price than would pay if this competition for the favourite cuts did not exist. What happens in England happens in America, and the cost of the best parts is as high in New York as it is in London. Neither in America nor in the States is the profit of the grower determined by the price of the best parts of the animal. It is determined by the price of all the meat which the animal produces. What the English farmer has to face is that American live meat can be profitably sold at 6½d. per lb., and he may dismiss from his mind any notion that the increasing population of the United States, or bad seasons there, will raise in a serious degree the price of American meat. The tide of emigration to the United States, which is now setting in so strongly, supplies labour, the Americans have plenty of capital; and with labour and capital the unused, or partially used, soil of the States can supply meat faster than the population grows. If there are bad seasons on one side of the Atlantic there are bad seasons on the other. The English farmer must set himself to face a constant supply of American meat at 6½d. per lb. He has some advantages on his side. He can produce perhaps a slightly better article. Englishmen prefer, from taste or habit, English meat; he is close to his market and can watch its turns. What is the pecuniary value of these advantages is most difficult to say. They may perhaps be said to reach, or even to slightly exceed, a halfpenny a pound. He cannot, therefore, reckon on getting more than a trifle over 7d. per lb. for his meat. How he is to solve the problem of growing meat with a profit at 7d. per lb. is a very large and difficult question; but, at any rate, it is something that he should know exactly what is the problem he has to solve if he is to thrive in the future as he has thriven in the past.

#### THE ARITHMETIC OF DISESTABLISHMENT.

**D**URING the past week two letters, each signed CHAS. S. MIALI, have appeared in the *Times* and the *Daily News* on the subject of certain recent volunteer attempts to obtain statistics of attendance at churches and chapels in some of the large towns of England. These letters are in the main identical, but that which appeared in the *Daily News* contains later and fuller statistics, and to it reference will here chiefly be made. Mr. MIALI draws several conclusions from his figures, one of which, as his readers who have glanced at the signature will probably anticipate even before they have looked at his tables, is that "the Church of England is no longer in respect of 'numbers the National Church in our great towns.'" It may be noticed, by the way, that while Mr. MIALI very fairly gives this last limitation, the *Times*, with characteristic inaccuracy, omits it in its comments, and says that "in England" the Church is in a decided minority—a statement not contended for by Mr. MIALI himself on this occasion, and certainly not borne out in any way by his facts, even if they are accepted without question. Some political allusions of the statistician would not require notice were it not for his expressions of regret

at the omission to procure recently a general religious Census. Mr. MIALI must have a conveniently short memory, or must suppose that none of his readers enjoyed the privilege of being a little behind the scenes at the general election of 1880. Those who had that privilege know perfectly well, and can assert without fear of valid contradiction, that one of the principal inducements then used to prevail on Dissenters to support Mr. GLADSTONE, and one of the chief congratulations made to them afterwards by their political leaders and advisers, was that under Mr. GLADSTONE there would be no "tampering with the Census." Every one to whom this phrase was addressed knew perfectly well what was meant by it. It meant that Nonconformists dreaded the exposure of the nakedness of their own particular land which such a tampering—that is to say, the inclusion of religious statistics in the Census—would occasion.

However, Mr. MIALI'S regrets are of less consequence than his figures. These figures are not new to those who take an interest in the subject; nor does Mr. MIALI pretend that they are. The results for the different towns given (twenty-five in number in the longest list, and varying in population from Liverpool with more than half a million inhabitants to Scarborough with but a few more than thirty thousand) were obtained through persons employed by local newspapers. They were procured on a uniform system—that of reckoning only one morning and, in most cases, one evening service. The result of this is to give usually, though not universally, a large majority to the various Nonconformist bodies, including Roman Catholics, though of course not one of such bodies pretends to vie with the Church. There is no need to insist on the intrinsically faulty character of an enumeration where the enumerators are irresponsible, and where they choose their own time and their own methods. But any one who is at all acquainted with the subject can see at once that, even putting aside the hypothesis of a "whip"—which most assuredly no clergyman of the Established Church would condescend to employ, even if he knew of the projected Census, while some at least of the Nonconformist sects would not scruple to do so—the plan adopted is disadvantageous to the Church. Scant notice is taken of afternoon evensong, which in some places is more numerously attended than the later service. No notice is taken of early celebrations of the Eucharist, or of midday celebrations, separate from the ordinary morning service. Nor is there any account of mission services and other miscellaneous functions, which are now so common. The second omission is of especial importance in these days, as any one must be well aware who frequents or even passes, not merely London churches, where early Communion is in use, but such country churches as St. Albans, Manchester, or All Saints, Bristol. As it happens, however, there is no need to reason on conjecture. A more remarkable instance of arrangement of figures than is furnished by Mr. MIALI'S account of the religious statistics of Southampton is not often to be found out of the annals of speculative finance. Southampton is a town of over sixty thousand inhabitants, and, like most seaports, it is not remarkable, in the opinion of any one who knows it, for extraordinary piety. It is, therefore, a very fair specimen town. According to Mr. MIALI, on the appointed day of reckoning 15,032 persons attended Church services, and 14,492 services at Nonconformist chapels. This looks like a victory for the Church; but luckily eight hundred Roman Catholics come to the rescue, and turn the balance, putting the Church in the minority. Now an inconvenient Correspondent of the *Daily News* itself has in a letter to that paper published from the original statistics in the *Hampshire Independent* a very odd comment on this computation. So far from eight hundred Roman Catholics attending the services of their Church on that day, only 346 did so, and these are included in the Nonconformist total given by Mr. MIALI, who has thus not merely counted his Roman Catholics twice over, but has multiplied them handsomely by about two and a half on the second occasion of counting. It is further shown that his eight hundred is a reminiscence of what must have been the purely imaginary statistics of 1851—purely imaginary, for the population of Southampton has increased immensely since that time, and no doubt its Roman Catholic population has increased in proportion. This is, to say the least, a curious fashion of manipulating facts. Moreover, it appears from the same statistics (upon which, be it remembered, Mr. MIALI

reasonable. Extrinsic evidence of the intention of the Legislature would be vague and uncertain; and it might be fairly assumed that the exercise of sovereign authority would be accompanied by a corresponding sense of responsibility. The failure of Parliament to express its own intention cannot be even considered by a court of justice; but culpable negligence in framing irrevocable enactments is a proper subject of private comment. In the case of the definition which has been discussed in the Divisional Court and in the Court of Appeal, there was no doubt that the startling innovation which would be introduced by one of two or three possible constructions of the statute had not been contemplated by any party in either House. The Bill of 1878 was referred to a Select Committee of the House of Commons, which reported in its favour. In answer to a doubt suggested by a member of his own party, the Conservative Chairman of the Committee assured the House that the Bill would cause no serious change in the law. The statement was confirmed by Sir C. DILKE, who had charge of the Bill, and the independent critic consequently offered no further opposition. There is no doubt that both assurances were given in perfect good faith, yet the most cursory examination of the Act shows that its meaning is open to doubt or, according to the opinion of both Courts, to an interpretation which was formally disclaimed by the framers of the Bill. The enormous importance of the issue which is now decided admits of no serious dispute. The counsel who opposed the allowance of the appeal by the Court below stated that the claimants under the Act of 1878 were comparatively few in number; but it was not disputed that at a future registration the enfranchisement of all lodgers would in many instances swamp the existing constituencies. The greater or less importance of the question could of course only affect the discretion of the Divisional Court in allowing or refusing the appeal. It is not the business of judges to inquire whether the sky will fall if justice is rigidly administered.

The Judges of the Court of Appeal, in the course of the arguments and in delivering judgment, exhausted the resources of dialectic ingenuity. They had no difficulty in showing that every possible construction involved a series of absurdities, if not actual contradictions. It would have been impossible to conjecture beforehand that Parliament would even seem to confer the same franchise on lodgers who paid a rent of 10*l.*, and on all other lodgers, or all tenants of non-resident landlords, whether they paid 10*l.* or 10*s.* As one of the Lords Justices remarked, the mischief arose from the misapplication of names, as in calling that a dwelling-house which was not a house, but a room.

The Court had to ascertain not what the Legislature had intended, but what it had said. In the particular case there was no opportunity of correcting an oversight, even by the cumbrous machinery of an amending Act. The present majority of the House of Commons favours a wide extension of the suffrage; and it would certainly not consent to any disfranchising measure. One precedent for organic legislation by inadvertence has lately been established by Mr. GLADSTONE. The careless statements which induced Parliament to pass the Act of 1878 were not more definite than the assurances which were given in 1870 that no right of property could be founded on a claim to compensation for disturbance. The vested right to vote which may have been conferred by bad or ambiguous grammar is not less sacred than the tenant right which, having once been unintentionally recognized, has since been purposely extended.

The political effect of a large and sudden addition to the constituency is a legitimate subject of discussion; whether it is effected deliberately or by accident, it cannot be regarded with indifference. One of the strongest objections to successive reductions of qualification is that those who are admitted are always ready to open the door of the Constitution to their allies who are still without. Down to a certain limit a privileged class of voters is a kind of aristocracy; but working men feel a closer connexion with one another than with the remaining section of the community. The artisans of the towns are unanimously willing to extend the suffrage to agricultural labourers, in the well-founded expectation that voters who depend on wages will, in political movements, generally act together. Ten-pound lodgers, of whom many belong to the middle class, are not perhaps equally anxious to share their rights with the poorest occupiers of unfur-

nished rooms. It is perhaps useless at present to vindicate the advocates of restricted suffrage from the charge of selfishness. A few years ago the upper and middle classes exercised almost all political power; and now, as the last general election proved, they are no match for those who have succeeded to their place. It is too often forgotten that political power exists in a fixed quantity incapable of increase, though liable to constant readjustment. What is given to one is taken from another; and the transfer is always in one direction. If, by a blunder in an Act of Parliament, any voters of the poorer class had been casually disfranchised, no opposition would have been offered to the early rectification of the mistake. A rectification of a much more pernicious error is practically impossible.

#### LORD HARTINGTON IN LANCASHIRE.

LORD HARTINGTON, in addressing his Lancashire constituents, has added another contribution to the numerous speeches of the recess. He spoke, as he modestly observed, not because he wished to speak to his constituents, so much as because his constituents wished him to speak to them; and, as he remarked, no one who did not like to read his speeches need trouble himself to do so. As it happens, Lord HARTINGTON is one of the few speakers whose speeches every one wishes to read. In a time of confusion and uproar it is especially interesting to know what are the thoughts uppermost in the mind of a man who takes up politics simply as a sphere in which he has got to do a painful duty, who looks on everything in the light of strong common sense, who is, as a rule, at once firm and moderate, and who represents more conspicuously than any one else a very important section of the Liberal party. He did himself very inadequate justice when he said that, if he left the Cabinet, the party could get on very well without him. The Cabinet without Lord HARTINGTON would be altogether a different Cabinet; and, if he cannot see this, no one else can be blind to it. Ordinarily he is very fair to his opponents, and he is always courteous; but the duty he has got to perform towards Ireland is so painful to him, it is to him something so dreadful, that the Government, with all its efforts, should make such very slow and small progress towards restoring order, that in his despondency he is more sensitive to the attacks of his opponents than he usually shows himself. He complained that he and his colleagues have been exposed to a criticism more bitter and unscrupulous than any to which a Ministry was ever exposed before. The famous Midlothian campaign must have passed for the moment out of Lord HARTINGTON'S memory. The Opposition cannot avoid criticizing things that are going on before their eyes. They cannot turn away from Ireland, for it is Ireland that fills the thoughts of England. If they think they can show that the Land Act is working an injustice which its framers never contemplated, if they think that the Government is using its powers too much or too little, they must say what they think, or they may as well give up politics altogether. Lord HARTINGTON can scarcely think that, if a Conservative Government were in power, and were charged with the difficult task of stamping out anarchy in Ireland, all Liberal critics would be so gentle and discreet as to look on in silence and allow it to be supposed that everything the Conservatives did in Ireland was right. That criticism, whether ill founded or well founded, enfeebles the Executive, is one of the evils inseparably attendant on party government. But criticism also sometimes strengthens the Executive, for it may tend to show that the Government is, after all, in the right. Lord HARTINGTON attacked the criticism of the Opposition, because it has not been suggestive. His critics tell him he is wrong, but will not or cannot tell him what he could do that would be better. This is, at least, partially true; but negative criticism is not without its uses to the Cabinet. Lord HARTINGTON stands resolutely by the doctrine that the great thing is to be patient, and to let the Government work in its own patient way. If he is right, it must certainly contribute to the acquiescence of the nation in his policy if his critics are discovered to have nothing better to propose.

At the first of the two meetings that he attended Lord HARTINGTON pressed on his hearers the necessity of preparing for a new contest, and warned them that they could

net hope to fight with the extraordinary advantages on their side which led to the unexpected triumph of the Liberals at the last election. The caution he gave was in every way justified. There is sure to be a large body of electors who get tired of every Ministry in turn, and who think it amusing and exciting to try a new set of governors. It is notorious, too, that the Liberal majority in the present Parliament is much greater than its average permanent strength in the constituencies warrants. Quite apart, therefore, from anything the present Ministers have done or have left undone, there is a strong probability that an early dissolution would be unfavourable to them. The result might be such that no other Government could be immediately formed; but the same Government would not have the same majority, and the large measures which this Government contemplates would have a much less imposing aspect if they were only carried by feeble majorities. To supplant the Government if possible, and at any rate to weaken it, the Opposition must prepare the minds of the electors for the coming change; and this is exactly what the Liberal Opposition did when Lord BRACONSFIELD was in power. All parties do and say very much the same thing in the great struggle for Ministerial existence. Lord HARTINGTON made some not ill-natured and not infelicitous remarks on the position of Lord RANDOLPH CHURCHILL. What he said one day, Sir STAFFORD NORTHCOTE said the next day. He played about at will in the lead of the tandem, and all the whipping fell on the back of the sturdy jog-trot old-fashioned wheeler. All party critics always say that their opponents are governed by their tail and not by their head. It seems only yesterday that every Conservative was prophesying that Lord HARTINGTON would get all the whipping and that Mr. CHAMBERLAIN would dance away in front. Even now there are Conservatives who would think that their prophecy was as true as Lord HARTINGTON's criticism. Lord HARTINGTON, again, complained that the leaders of the Conservatives were too much inclined to humour the follies of their Protectionist supporters, and did not state with sufficient explicitness their own wiser opinions. Although Lord SALISBURY separated himself from his Protectionist friends in language as distinct as could be desired, Sir STAFFORD NORTHCOTE was at one time evidently puzzled as to what he ought to say about Fair-trade. His language was obscure, and might have been mischievous had not reviving trade and its own weakness killed the Fair-trade movement almost before it was born. But every leader in turn has to meet the difficulty of deciding how far he is to patronize supporters who are wrong on some one point. When Lord RAMSAY tried to catch the Home Rulers of Liverpool, Lord HARTINGTON warmly encouraged his canvass, and did not think it necessary to obtrude, in any marked way, his own personal opinions about *Homo Rale* into his estimate of his friend's qualifications.

Like every one in and out of the Cabinet, Lord HARTINGTON thinks first of Ireland; but, after Ireland, his thoughts are given almost wholly to the reform of Parliamentary procedure. He has made the subject peculiarly his own, has thought long and carefully over it, and is not inclined to shrink from conclusions because to most men they would seem novel and startling. When he says that what he seeks is a change that will restore the House to its old dignity and its old consideration, every one feels that he is only saying what he honestly thinks, and that the credit of the House is a chief object of his care. Proposals the only object of which would be to make the House of Commons dignified and efficient would be welcomed by all moderate and sensible men. But it is so very difficult to frame proposals which will effect this object and no other—which will not only do good, but will, in doing good, not do greater harm—that the nearer he gets to the time when the Government will have to decide what to propose, the more strongly he seems to feel what a very onerous and dangerous task it is that the Government has chosen to take up. He even went so far as to express a doubt whether the whole of next Session must not be given up to the reform of procedure. The Government, he hinted, might not have any time to think of any big Bill. A six months' wrangle over procedure is a dreary prospect for Parliament itself, and for all who follow its fateful course. But, even if it gives up a whole Session to the discussion, the Government cannot be sure of carrying its proposals. It has an enormous majority, and in this matter it has not got to obtain the assent of the House

of Lords. But still it despairs of success unless it is strongly supported by the constituencies, and Lord HARTINGTON invites the constituencies to support the proposed change because without it they cannot get the strong Bills carried on which they are supposed to have set their hearts. Lord HARTINGTON is an excellent judge of the position of the Ministry, and he would not have said what he did unless he had been very much in earnest. It is the Liberal constituencies that must really carry the proposed reform of procedure. This may be true, but it certainly places the proposal in a peculiar light. The reform has one object, the restoration of the dignity of the House; but it also has a second object, the carrying of a series of strong measures. Those who dislike the measures can scarcely fail to be distrustful of the reform. The appeal is not to Conservative constituencies; for, although they might wish to see the increase of the dignity of Parliament, they cannot wish to facilitate the passing of measures they dislike. It is obvious, therefore, that what the Government dreads is a falling away of the Liberal majority on this one delicate point. On Liberal waverers Liberal constituencies can exercise great pressure, and Lord HARTINGTON begs that they will exercise it, and that they will keep their members firmly bound to the doctrine that to wish the end is to wish the means, and that to desire a reform of the Land-laws and an extension of the suffrage implies a willingness to cast away all doubts as to the wisdom of the proposals made for the reform of procedure.

#### THE TURKISH DEBT.

THE English creditors of the Ottoman Government are much indebted to Mr. BOURKE for the labours which he seems to have brought to a successful termination. The elaborate arrangement which has been published will only be intelligible to skilled financiers who may have an interest in the matter. As UNDER-SECRETARY for FOREIGN AFFAIRS during a long and troubled period, Mr. BOURKE must have acquired both general experience in diplomacy and a special knowledge of the affairs of Turkey. There is perhaps some convenience in his position as a political opponent of the present Government, though there is no reason to suppose that he had reason to complain of undue want of official countenance. It has been recently established as a maxim of English policy that the Government takes no part in enforcing the private claims of its subjects against foreign States. Lord PALMERSTON was inclined to strain general rules when there was any plausible reason for interfering on behalf of English creditors; but on the whole it is reasonable that capitalists should rely exclusively on their own judgment of the integrity and solvency of States with which they think fit to deal. For this purpose it is expedient that their own Government should as far as possible abstain from interference with foreign loans. There were some exceptions to the practice in the case of the Turkish debt; but by far the greater portion of the loans was contracted without official participation. The moral responsibility of the English Government was confined to its original share in educating the Turks into the civilized practice of borrowing. Before the Crimean war there was no national debt in Turkey; but for several following years it seemed as if the Porte were entitled to unlimited credit. The latent wealth of the Empire was considerable, and lenders were not sufficiently careful to inquire whether its material resources were in process of development. Through a rapid succession of loans the Turkish Government had no difficulty in paying interest out of principal to the satisfaction of ignorant holders who were contented to receive a large and regular income on their investments. As in all similar cases, Turkish stock was largely held by the classes which were least able to bear a loss. Large annual returns are most attractive to small capitalists, who risk their means of subsistence for the sake of temporary ease.

Total or partial bankruptcy was perhaps inevitable; but the cessation of payment was precipitated by Russian influence in preparation for the war which speedily followed. General IGATIEFF persuaded the Sultan ABDUL AZIZ suddenly to suspend payment of interest, with the result, and probably with the object, of alienating the sympathies of Western Europe from the insolvent Empire. At first only an arbitrary reduction of interest was

announced; but, after the outbreak of war, it became obviously impossible that for the time the Ottoman Government should discharge its obligations. Since the conclusion of peace the SULTAN's successive Ministers have found difficulty in raising money for current expenses; and they have always known that the claim for the Russian indemnity was hanging over their heads. The hopes of the bondholders depended on the urgent necessity of restoring to some extent the national credit. Unless something was done for existing creditors, there could be no hope of borrowing for the future. With this solitary basis of negotiation, Mr. BOURKE has been able to stipulate for an assignment of certain revenues as security for the payment of a low rate of interest and for a sinking fund. The Russian Embassy, though it has from time to time interfered in the negotiations, admits that, according to the provisions of the Treaty of Berlin, the claims of the bondholders take precedence of the payment of the indemnity. The statement that the financial administration of certain provinces was to be transferred to the Russian Government has been contradicted; and the true state of the case is still imperfectly known. In the meantime, the representatives of the creditors have obtained securities for payment of the reduced interest which have sufficient value to make the bonds once more marketable. Perhaps the best result which can follow would be the transfer of the bulk of the debt from needy holders into the hands of speculative capitalists, who will probably be able to protect themselves against loss. The conclusion of Mr. BOURKE's negotiations will in many cases operate to the relief of urgent distress.

The SULTAN and his Ministers have, in the course of the discussion, exhibited a not unreasonable apprehension that attempts would be made to impose upon them a financial control after the model of the efficient though anomalous system which has been introduced into Egypt. There can be no doubt that the solvency and financial prosperity of Turkey would be promoted by the substitution of European administrators for native financiers; but, even if such control could be forced on an unwilling Government, it would be highly undesirable that foreign Powers should undertake an embarrassing responsibility. The Egyptian relations of England and France to one another, to the KHEDIVÉ, to the Porte, and to other European Governments, are already delicate enough. In Constantinople the exclusive control of two Powers would probably not be allowed; and the SULTAN is even now more formidable than a Viceroy of Egypt. The tutelage which is exercised over the KHEDIVÉ is justified, as far as England is concerned, by a paramount interest in the protection of the Suez Canal; and it was from various causes found impossible to exclude the partnership of France. If the existing system can be maintained for a few years, the effect on the prosperity of Egypt will be so obvious as to justify, and perhaps to insure, a continuance of the joint Protectorate. It would be a far more arduous undertaking to protect the subjects of the SULTAN in Europe and Asia from fiscal and administrative oppression. By this time the Turkish Government is probably satisfied that its apprehensions were unfounded. Mr. BOURKE and his French colleague have confined themselves strictly to the advocacy of the private interests which they represented; and measures have apparently been taken to satisfy or to adjourn the claims which were preferred by the Russian Embassy. The agents of the foreign creditors have made arrangements with the local bankers on whom the Government depends for a periodical supply of ready money. No long interval will probably elapse before proposals are made for the contraction of some new loan, if such a transaction is rendered possible by a partial revival of the national credit.

There is probably some foundation for the prevailing rumour that the SULTAN attaches much importance to some recent indications of good will on the part of Germany. The courteous reception which was afforded at Berlin to the complimentary Turkish mission may possibly have had some political significance; but the SULTAN, who possesses considerable ability and some political experience, can scarcely share the sanguine hopes of the news-mongers of Constantinople. It appears that, with Oriental boldness of conception, some Turkish politicians have imagined an offensive and defensive alliance between the SULTAN and the German EMPEROR, of which France is to be the victim or the object. Prince BISMARCK is supposed to meditate an invasion of France, while the Turkish

forces are to co-operate for the purpose not only of re-establishing the sovereignty of the SULTAN in Tunis, but of reconquering Algeria. The hope that the statesman who declined to sacrifice the life of a single Pomeranian Grenadier for the maintenance of the integrity of the Turkish Empire would engage in a project for the propagation of Mahometanism in Northern Africa deserves neither refutation nor criticism. There is no reason to doubt the sincerity or the accuracy of Prince BISMARCK's assurances given to the German Parliament, that the prospects of European peace are more favourable than at any recent time. The German Government probably regards either with indifference or with complacency the employment of the military and financial resources of France in the conquest or pacification of Northern Africa. The report of a German alliance with Turkey for the repression of French enterprise in remote regions is a preposterous fancy. It is not improbable that Prince BISMARCK may be disposed to cultivate an influence at Constantinople which might be useful in certain contingencies; nor can there be a doubt that the faintest overtures on his part would be cordially welcomed. No other Power is for the present likely to compete for the SULTAN's favour or confidence. The French enterprise in Tunis has, notwithstanding the assurances of the late Government, caused not only serious irritation, but anxiety for the independence of Tripoli. Although Mr. GOSCHEN lately declared that the influence of England at Constantinople was undiminished, Mr. GLADSTONE's Government has little reason to count on the good will of a Power which is indebted to him and his party neither for benefits nor for courteous forbearance. Lord DUFFERIN's demands for improved administration in Armenia appear to have been equally unwelcome and ineffective. It must also be remembered that the Protectorate of England and France over Egypt is regarded by the SULTAN and his advisers with unconcealed dislike. It is improbable that, after abandoning the Eastern policy of former times, England should receive the deference which was formerly paid to a powerful protector. If Germany were willing to occupy the vacant post, her patronage would be gratefully accepted. The slightest tokens of good will are in the meantime estimated at an excessive value.

#### THE STATE OF IRELAND.

THE discovery of a Fenian arsenal in Dublin can hardly be said to be alarming, because alarm implies a certain amount of surprise, and nothing could be less surprising than the occurrence in question. That the anarchic movements of the last two years tended to produce a revival of Fenianism, and would eventually merge themselves therein, has been perfectly evident from the beginning to those who had eyes to see. The question of the exact relation of the Irish Republican Brotherhood to the Land League has, however, naturally given a fresh occasion for the usual display of paradox on the part of supporters of "the Revolution," as their counterparts on the Continent frankly and conveniently term the whole mass of anarchic-democratic plots, plans, and principles. According to this view, Fenianism has arisen because the Land League has been suppressed. The two things are naturally opposed, and the death of the one means the life of the other. The supporters of this idea might, indeed, quote in their favour the somewhat unwise words of Lord COWLEY about driving Irish discontent below the surface. What is driven below the surface at one place naturally breaks out at another point. It is, however, tolerably obvious that this paradox is unnecessary except as a convenient support to protests against coercion. There is no radical difference between an anti-rent movement and an anti-Government movement, and the agitation which has maintained the one necessarily feeds the other. But it may be admitted that the Fenian form of the disease is, if the more malignant in appearance, really the less dangerous because the more likely to be treated drastically. At present no appreciable portion of the supporters of the Government is in favour of actual abdication in Ireland, and against armed political insurrection Mr. GLADSTONE and his colleagues may still be trusted to act. Lord HARTINGTON may argue that it is no part of the business of Government to collect rents or enforce the rights of property. It is true that he would find it difficult to carry his pro-

position very far. For that the ultimate, if not the immediate, object of Government is to maintain, if necessary by enforcing them, the rights of property is tolerably clear. It is also rather curious that Lord HARTINGTON should have omitted to state more fully his views about the protection of life and person, and the duties of Government in relation thereto. But even Lord HARTINGTON—probably because he has had considerable experience in this very matter in days past—does not apparently question the duty of Government in reference to the putting down of treasonable organizations armed and organized against the lawful Government of the country. It may therefore be argued reasonably enough that the appearance of Fenian agitation in some strength is not wholly to be regretted. It is a head of the same hydra as the No-rent conspiracy, but it is a head which HERCULES does not refuse to cut off.

Of positive, as distinguished from apologetic, contributions to the discussion of the Irish question, Lord HARTINGTON had not much to make; and the only other member of the Government who has recently touched the question had still less. Mr. HERBERT GLADSTONE'S tour in Cork and Kerry has not apparently inspired him with anything but vague hopes of a good time coming. Meanwhile, he performs the somewhat singular function of acting as intermediary to convey and explain to the public his father's utterances in reference to the LORD MAYOR'S Fund, a proceeding which may be said to open up a new profession for younger sons. Up to the date of this publication the Ministry had observed towards this auxiliary movement what may perhaps pardonably be called an equivocal silence, nor is the telegraphic utterance now given to the world much more explicit. It may be doubted whether the management of the Fund hitherto has been wholly judicious, particularly in regard to the expression, or rather concealment, of the actual definite objects in view. Even the LORD MAYOR'S letter to Mr. GRENFELL is far from being definite. The description of these objects, as undertaking or supplementing the duties of executive government, has been violently objected to by those who seem to think it of less importance that Ireland should be well governed than that their own party leaders should have the reputation of governing it well. A better description perhaps would be that the object of the movement is to force the hand of the Government. The policy which has here been constantly advocated, and which has in the last few days been announced elsewhere as a desirable discovery—the policy, that is to say, of a combined attack on the great scale—should be rendered possible by such a fund, and should be announced as its principal aim. Lord CARYSFORT thinks, pardonably enough, that this attack has already been made by the Property Defence Association; but such is not the appearance which things wear to observers at a distance, who are in this particular instance perhaps best placed for seeing. They see that the attack has hitherto been made in a straggling fashion, so that in each district the supineness or the pecuniary inability of some landlords has spoilt the effect of the energy and forwardness of others. The same incapacity for combined action is apparent in the premature meeting of Irish landlords on Thursday. What is wanted is that over some wide district, by concerted and simultaneous action, every tenant should have the option given him of paying or going, and that, in case of refusal to pay, the holdings should be resumed as soon as the law permits, and fresh tenants obtained for them at once. This would necessitate a great outlay, not merely in law expenses, but in the hiring of emergency garrisons; and it could not be effectual without vigorous help on the part of the Government. But it would pretty certainly bring matters to a crisis. For such a course of action the LORD MAYOR'S Fund would find plenty of subscribers, and the Government, uncertain as its utterances have been, is with tolerable distinctness pledged to give it support. Subsidies scattered here and there over Ireland may be a great benefit to individual landlords, but they will do little to improve the political situation.

It is now finally announced that the movement for promoting an Exhibition of Irish manufactures has fallen through. The failure has from the first been probable, if not inevitable, owing to the discordant elements present and the obvious intention of the disloyal to consent to no plan which would not in some way or other involve an insult to the English Sovereign and a protest against English sovereignty. Between the adoption of such plans and the

alternative prospect of an indefinite encouragement to Boycotting, there is no obvious third course except the abandonment of the project. The incident is not altogether to be regretted, because it shows the real attitude of the Irish political disturbers—even of those whose moderation or cowardice has hitherto kept them out of Kilmainham—towards measures intended to further the prosperity of their country. "Perish Ireland, if it is not to be saved according to our nostrums," is the now openly announced motto of these persons. Meanwhile the paper read on Tuesday at the Statistical Society by Mr. PHILLIPS BEVAN, and the discussions thereon, are both of interest and importance in connexion with this question of Irish manufactures. Nothing could well be more significant than a statement made by Mr. NEPEAN, the Director of Army Contracts. Mr. NEPEAN told his hearers that he had himself been empowered to advertise for tenders in Ireland for Government stores to be consumed in that country—a point on which it may be remembered that clamour has frequently been raised in Parliament by the very persons who are now bent on ruining the Irish Exhibition—that in four months only five proposals were made, and that of the five inquirers only two actually sent in tenders. This result will probably agree with the private experience of many other persons. It is a common thing to find, when inquiry is made for something of Irish manufacture, that nothing is known of it by English wholesale houses and commission agents, that the manufacturers have no London representatives or correspondents, and that, if the thing is to be got at all, it is by the tedious and troublesome process of finding out the Irish address and writing to Ireland for it. Every grocer's shop in London is full of goods made at Aberdeen, while a Dublin trade-mark is the rarest thing in the world, though Dublin is accessible in about half the time which it takes to reach the Scotch town. If the Irish manufacturer is thus *divinus orbe*, it is simply the fault of his own want of enterprise. Mr. NEPEAN says that he believes Irishmen do not want manufactures because they are unwilling to leave the soil, which is probably true, and is certainly a curious comment on the wisdom of a policy directed to rooting them in that soil. However this may be, the proposed Exhibition would almost certainly have given Irish manufactures an impulse, if only from the simple and almost unavoidable result of introducing them to English buyers. That is not what the agitators want. An Ireland poor and discontented is the necessary postulate of all their designs; and, when it is remembered how far the present Government has gone in the direction of securing it to them in the future, it must be admitted that there is some foundation for the bitter complaints of their ingratitude made by that Government's English partisans.

#### MR. BLAINE'S DESPATCH.

MR. BLAINE'S despatch to Mr. LOWELL on the subject of the Panama Canal has the merit of plainness and candour. The American Government, while it almost ironically disclaims aggressive designs, announces that its object is to secure the freest and most rapid transit for its own vessels and munitions of war, and to prevent other nations from having similar advantages. Mr. BLAINE condescends to find a precedent for his claim in the policy of the English Government, which, as he asserts, fortifies every point that can secure the passage of troops to India. "Every point," when the phrase is reduced from rhetorical vagueness to geographical and political fact, means Malta and Gibraltar, both of which strongholds are hundreds of miles from the Isthmus of Suez; Cyprus, in which there are as yet no fortifications; and Aden, which, like the Mediterranean fortresses, was occupied long before the Canal was designed. Corfu was abandoned many years ago, though the fortress was believed to be almost impregnable. The English Government, then represented by Lord PALMERSTON, would gladly have avoided the risks and possible complications which are connected with the construction of the new mode of transit. Hitherto it has as far as possible avoided collision with other Powers; and it has never pretended to exclude other nations from the advantages which it may claim or enjoy. For the purposes of commerce the proposed connexion between the Atlantic and Pacific may be scarcely less important to England than the Suez Canal. The poli-

tical pretensions now advanced by the United States are not improbably preferred with the ulterior purpose of establishing a commercial monopoly. Although there is no shadow of justification for such a claim, the Americans may perhaps intend that the maritime communication between the Atlantic ports and San Francisco shall be appropriated to their own coasting traffic. It has been recently discovered that the interests on which CORDEN relied as the future causes of universal peace are now the principal motives or pretexts for war and for aggressive diplomacy. As Russia is annexing Central Asia for the extension of commercial monopoly, there is reason to fear that the American Government is urged by similar considerations to establish a political supremacy over the Western hemisphere. It is true that Mr. BLAINE has not expressly proposed to abrogate the clauses of the treaty of 1850 which provide for commercial equality; but he prepares the way for such a demand by describing the inter-oceanic commerce of the United States as a coasting trade; and the parts of the treaty which are not immediately repealed are not less liable to future repudiation than the more important provisions which are now made to depend on the will of one of the contracting parties. A future Mr. BLAINE will not hesitate to justify new demands by the acquiescence of England in the repudiation of American contracts.

When Mr. BLAINE first protested against the interference of any European Power to secure the neutrality of the Panama Canal, he relied on the provisions of a treaty concluded between the United States and the Columbian Federation in 1847. He had, as it would seem, overlooked the later treaty of 1850 between England and the United States, of which Mr. CLAYTON and Sir HENRY BULWER were the negotiators. One consequence of his inadvertence was that he attached paramount importance to an international contract, although it could in no way affect the rights of any other State than those which were parties to the treaty. According to Mr. BLAINE's interpretation, the United States were bound by their written obligation to guarantee the neutrality of any canal which might be made across the Isthmus. He further inferred that the spirit of the compact excluded the participation of any other Power. The incidental circumstance that the Columbian Government neither claims the fulfilment of the treaty of 1847, nor assents to the present proposals of the American Government, was left out of consideration. The exemplary respect of the SECRETARY OF STATE for formal conventions has not extended to the CLAYTON-BULWER Treaty, to which his attention has since been called. Circumstances have changed, as indeed they usually change in thirty years, and as they had changed in thirty-three years from the date of the Columbian Treaty. The particular novelty to which Mr. BLAINE refers as invalidating the arrangements of 1850 is the rapid growth of American interests on the Pacific coast. Unluckily for his argument, the American frontier has remained precisely the same since the conclusion of the treaty and for many years before it. The latest extension of the territory of the Union took place at the end of the Mexican war, and it was with full knowledge of the geographical relations which still exist that the two Governments agreed jointly to protect any communication which might be made between the Atlantic and the Pacific. The treaty dealt with other matters, to some of which, such as the abandonment of the Mosquito Protectorate, the American Government attached considerable importance. The part of the treaty which purported to secure the neutrality of the Canal was in its nature provisional, and the contingency in which it was to become operative has not even now occurred. The repudiation of a solemn undertaking cannot perhaps be prevented, but it must be stigmatized as it deserves. The contracting Governments would, if the question had been material or relevant, certainly have anticipated that in the course of a generation the prosperity of California would largely increase. The gold discoveries which accelerated the advance had already been made.

The vicious precedent of the abolition of the Russian Black Sea Treaty in 1871 is producing its natural results. It would perhaps have been impossible to restrain Russia from a breach of faith which was encouraged by the victorious Government of the new German Empire; but there was no occasion formally to agree to a sacrifice in which it may have been necessary to acquiesce, and the feverish eagerness with which Mr. GLADSTONE welcomed the fulfilment of his own unpatriotic prophecies involved a

humiliation to England which now seems likely to be repeated. It may be true that treaties cannot last for ever; but it is a modern and mischievous innovation to assume that they may be revoked by one of the contracting parties as soon as they can be disregarded with impunity. The rapid deterioration of international morality is illustrated by the contrast between the license now assumed by Russia or America, and the pedantic assertion of obsolete rights which seemed natural within living memory. Lord PALMERSTON protested against the Spanish marriages in virtue of the Treaty of Utrecht which had been concluded a hundred and thirty years before, and which had been followed by wars with the old French Monarchy, with the Republic, and with the Empire. Mr. BLAINE coolly announces that his Government can no longer be bound by an agreement of thirty years' standing, deliberately made for due consideration on either side. The only excuse which he alleges is the natural and anticipated growth of American population and trade. It was less easy to foresee the enormous increase of English shipping, a large portion of which will require the use of the Canal. At the date of the CLAYTON-BULWER Treaty the American mercantile marine was equal to that of England, and it was growing more rapidly. The comparative amount of English shipping is now enormously larger. It is difficult to follow Mr. BLAINE's course of reasoning when he refers to another supposed change in the circumstances of the case. The Civil War has, as he asserts, proved that the military power of the United States is unlimited; but the CLAYTON-BULWER Treaty prohibits the erection of American fortifications in the neighbourhood of the Canal. No similar restraint is imposed on the employment of an English naval force, and accordingly Mr. BLAINE proposes to exclude it altogether. When the treaty was concluded the English navy was as much superior in force to the American as at present; while, according to Mr. BLAINE, the military superiority of the United States had not then been so fully established. Arguments in support of wilful wrong naturally partake of the insolence of the conclusion.

If, as is too probable, Mr. FRELINGHUYSEN maintains the contention of his predecessor, the English Government ought to be fully aware of the extravagance of pretensions which are not confined to a demand for a monopoly of the Canal. Mr. BLAINE's Chilean and Peruvian despatches imply the same assumption that both North and South America are subject to a certain sovereignty on the part of the United States. It is more than probable that the claim is preferred, not only to gratify national vanity, but to secure commercial preference in return for political support. The trade of the South American ports is as rightfully open to England as to the United States; and every European Power is entitled to treat the South American Republics as absolutely independent. In this case the material resources of the Union, however great, can scarcely be used to support exorbitant pretensions. Chili and Peru are out of reach of the army which Mr. BLAINE describes as irresistible; and it is not consistent with the present policy of the United States to maintain a powerful navy. The South American States themselves will probably repudiate the exclusive supremacy of a Power which is not even a neighbour. The difficulties which may arise with reference to the use of the Panama Canal are likely to be more formidable; and they would be aggravated by any recognition of the justice of overweening demands. The value of the exchanges of sentiment which were lately supposed to indicate reciprocal attachment had already been appreciated by serious politicians; but it could scarcely have been expected that two irritating challenges should be addressed by the American Government to England immediately before and immediately after the death of Mr. GARFIELD. The Fortune Bay dispute had been settled; and it was hoped that there would be no immediate disturbance of friendly relations. English well-wishers to America must console themselves as well as they can by the consciousness that they have offered no provocation.

#### M. GAMBETTA AND THE COUNTRY.

M. GAMBETTA has shown that he possesses a kind of self-control which is rare among Frenchmen. All the wits of Paris have been laughing at him for doing nothing, and he has calmly gone on doing it. Weaker men would have been feverishly anxious to make

their mark before the Chambers separated for the Christmas holidays. M. GAMBETTA has behaved like a Minister who knows that he has time before him, and is not obliged to score the first trick lest no others should fall to his share. The Session which has just ended has been an excellent subject for Opposition journalists of all shades. Everything was put off until the new Ministry had taken office, and now the new Ministry is in office, and everything is put off still. M. GAMBETTA is quite unmoved by these repeated demonstrations that he has disappointed the just hopes of his countrymen. For one thing, perhaps, he knows his countrymen better than his critics know them. He may believe, and seemingly with reason, that France is not in a hurry to see great political changes effected, and that she is not in the least disturbed by the discovery that M. GAMBETTA is not in a hurry either. It is enough for her that he is at last in office. She has waited so long for this to be brought about that she is not likely to want any fresh excitement for some time to come. Englishmen will be inclined to wonder why, if France wishes for no fresh excitement, M. GAMBETTA should not definitively discourage the belief that any fresh excitement will be provided. Granted that many foolish promises have been lightly made, why should they not be broken as lightly? They have been made to the nation; and, as the nation does not demand their fulfilment, M. GAMBETTA may fairly hold himself excused from thinking any more about them. If his intentions had to be divined solely from his action since taking office, there would be some ground for thinking that he means to sit loosely by his pledges. At all events, he has taken his time about making them good. There have been instances before now of Ministers broaking entirely with their past when once they had entered upon office, and using for the benefit of the nation the power which had been given them for the benefit of their party. M. GAMBETTA would have considerable advantages if it pleased him to follow this example. The greater part of his promises have been given by journalists whom he can disown; his own positive statements have frequently contradicted one another; and the politicians whom the Radical half of them were designed to catch are now so hostile to him that he may fairly be excused from doing anything more to conciliate them.

But the character of the Cabinet which M. GAMBETTA has chosen does not bear out this theory of his intentions. If he had wanted an excuse for pursuing in office a more moderate policy than he had recommended as a private deputy, it would have been natural to pave the way for the change by surrounding himself with colleagues of comparatively moderate opinions. A Cabinet, ordinarily speaking, is a Committee in which every member has an equal vote, and the Prime Minister can only exercise control by threatening to withdraw the bond that holds the Cabinet together. But M. GAMBETTA has taken special pains to surround himself with colleagues who have as good as no vote. There is not one of them, with the exception of M. BERT, whose resignation would be so much as noticed by the public; and even M. BERT's retirement would generally be considered as strengthening rather than weakening M. GAMBETTA's position. Consequently, if M. GAMBETTA now changes his front, everybody will know that he has done so to please himself, and not in deference to his Cabinet. The excuse of having to make sacrifices in order to keep the Ministry together will not be available. It is true that reports go about from time to time of Ministerial changes which may shortly be looked for, and it is of course possible that when M. GAMBETTA again has places at his disposal, he may renew his overtures to M. DE FREYCINET or M. FERRY, or may even extend them to M. WADDINGTON. It is not obvious, however, why he should do this, when it rested with himself only a few weeks back to make similar overtures effectual. If M. GAMBETTA could not make his programme acceptable to the Moderate Left in November, why should it be any more acceptable to them in January? He may, indeed, have completely reconstructed it in the interval. But changes of this sweeping kind are not commonly effected without some apparent reason, and in this case there is no such reason. The country has given no indication of any dislike to M. GAMBETTA's supposed policy; it is simply waiting with patient curiosity to see whether the real and the supposed policy will prove to be identical. There seems to be no ground, therefore, for expecting any decided change in M. GAMBETTA's programme beyond the

want of any ardent or general desire that the programme he has actually issued should be carried out.

It may fairly be asked, however, why the want of any such desire should not be motive enough for M. GAMBETTA's conversion to moderate views. If the country does not wish for extreme measures, it is rash, to say the least, to give it extreme measures. The electors may come to like them more when they see them, but it is equally possible that they may like them less. The great body of the peasantry is no more revolutionary under M. GRÉVY than it was under NAPOLEON III. It is Republican now, as it was Imperialist then, because it thinks that the Republic is the Government that will give it the best security for the particular things it most cares for. It would seem, therefore, that M. GAMBETTA has every possible inducement to pursue a moderate policy. The Extreme Left have refused to make terms with him, so that he is no longer bound by any offers he may formerly have made to them. The country has shown no desire to see the Radical policy lately associated with M. GAMBETTA's name brought down from the region of speculation to the region of fact. On the side of moderation there is, apparently, certain safety; while on the side of revolution, even of that limited revolution which is probably all that M. GAMBETTA contemplates, there is at least a possibility of danger. Why should a man so able, so versatile, so able to frame new formulas when it suits him, so little hampered by any formulas he has formerly framed, not at once throw overboard the political cargo with which he started, and govern France in the commonplace and common-sense way in which, to all appearances, she wishes to be governed? The most probable answer seems to be that M. GAMBETTA—so long, at all events, as he is Prime Minister—has to consider something else than the abstract views that his countrymen may hold upon the way in which they would like him to rule them. As Minister, he has to administer a Parliamentary Government, and under a Parliamentary Government he has to reckon with the Chambers as well as with the electors. It might be supposed that, with universal suffrage, the Chamber would exactly represent the electors; or, at all events, that by means of a dissolution it might at any moment be made to represent them exactly. But this theory leaves out of sight the obstinate tendency of the French elector to stay away from the poll. If he is satisfied with the way in which things are going on, he thinks that it is not worth his while to vote; if he dislikes the way in which things are going on, he thinks it safer not to vote. The consequence is that the conduct of affairs constantly tends to fall into the hands of a convinced minority. The majority take no part in the elections, and the deputies are returned by the comparatively few voters who are really interested in the contest. The issue at the last general election does not seem to have lain between the moderate majority and the extreme minority, but between one extreme minority and another, and the result was a victory for the Radicals over the Legitimists and the Bonapartists. Thus it is quite possible that the country at large might be in favour of moderate measures, that a Minister might quite accurately interpret its wishes, and yet that he might be beaten in the Chamber. An appeal to the electorate is, after all, only an appeal to that fraction of the electorate which can be induced to come to the poll; and if this fraction, instead of representing the moderate majority, only represents an extreme minority, a Minister may feel with some reason that what he has to consider is not the Chamber that might be returned if every elector voted, but the Chamber that will be returned by the electors who actually vote. M. GAMBETTA may have in view the fate of M. THIERS. There never was any doubt that the country was with him, but the country was inert, and a hostile Assembly was in possession of the field. Even if M. THIERS had had the power of dissolving the Assembly, it is by no means certain that his real supporters would have taken the trouble to vote for him. The new Assembly would no doubt have overthrown the reactionary majority who were striving to destroy the Republic; but M. THIERS might have found on the morrow of his victory that he had merely defeated one extreme faction by means of another, and that he was as far as ever from commanding any effective support from the moderate party in the electorate.

## THE LONDON WATER COMPANIES.

THE London Water Companies have recovered from the panic that followed upon the failure of Sir RICHARD CROSS's benevolent scheme for buying them up at their own valuation as completely as the Gas Companies have recovered from their scare about the electric light. The despots who distribute what in London may almost be called these twin necessities of life seem to be perfectly happy in the contemplation of the future. They exactly realize DAVID's description of prosperous but unamiable persons in his days. "They are not in trouble as other men, neither are they plagued like other men." Their latest triumph is a decision given in the Marylebone Police Court declaring the annual value in respect of which the Companies are entitled to charge for the water they supply to be the gross value or annual rent which a tenant may reasonably be expected to pay for his house. As the annual value thus interpreted is usually a good deal in excess of the amount at which houses are assessed to the Poor-rate, this decision will largely increase the income of the Water Companies. The only fly in the very large pot of ointment thus made over to them is the determination of the particular tenant who disputed the claim to carry the question into as many courts as the law will allow. Mr. DOBBS's municipal spirit is an example by which we may all profit. He is animated by a really heroic determination not to yield to what he thinks injustice. Most men would remember the cost of fighting a Company, and would rather pay on double the gross value of their house than stand the certain expenses of a law suit. Mr. DOBBS speaks of the coming conflict with something very like pleasure. "Yesterday," he writes to the *Times*, "I made application to the magistrate to state a case for the opinion of the high Court, and the fight between the Company and myself is now about to commence in earnest." He is prepared to carry it through at his own cost; and it is with the air of admitting the public to a privilege which he does not think it right to keep wholly to himself that he adds that he will allow donations from those who may be disposed to take a part in the suit to be paid to the joint account of two or three persons, provided this does not in any way impair his own freedom "to carry on the contest fully and effectually." If the Water Companies and the Gas Companies had more customers like Mr. DOBBS, their attitude towards the public might be a little less autocratic.

Unfortunately, even if Mr. DOBBS wins the day, and the gross annual value is declared not to be the foundation of the London water-rate, the Water Companies will still retain mischievously large powers of taxing the public. There cannot be a more absurd principle of payment for an article the consumption of which is exceedingly varied than the value of the house to which it is supplied. The analogy of parochial rates does not apply here. When a benefit is enjoyed equally by all those to whom it is given, it is very reasonable that each recipient should pay for it according to his means. The expense of lighting and cleansing the streets, for example, or of protecting life and property, is quite properly assessed on the value of the houses in the district. Everybody is the better for the outlay, and the cost of the house in which a man lives serves as a rough, but sufficient, guide to the proportion of it which each person is able to bear. But there is neither justice nor reason in making a bachelor tenant and the father of ten children pay precisely the same sum to their Water Company because the houses they severally occupy happen to be of the same annual value. In the one house five or ten times as much water may be used as in the other, yet the sums asked in return by the Water Company are identical. The demand is calculated not on the value of the water supplied, but on the ability of the tenants to pay. Something like the same rule obtains, it is said, in India with regard to articles of food; and a covenanted civil servant pays one price for his leg of mutton, while the shopkeeper pays another. But Indian customs are not usually considered good models for English legislation, and the practice in question has nothing in it to justify exceptional imitation. When the same article is supplied in very different quantities, payment by the amount actually delivered is the only method that can properly be resorted to. In this respect the Gas Companies have shown either less boldness or more conscience than the Water Companies. People grumble about the quality

of their gas or they suspect the accuracy of their meters; but in name, at all events, they are charged for what they actually burn. It is only where water is concerned that it is assumed that a man who lives in a house rated at 300*l.* must necessarily be more lavish of water than a man who lives in a house rated at 100*l.* There is the best possible reason why this assumption should not be sanctioned in the fact that the amount of water supplied admits of being ascertained with very fair precision. If there were no means of finding out how much water is used in a particular house, to apportion the charge to the rental might be a convenient way of getting over the difficulty. It would be perfectly easy, however, where cisterns are used, to arrange them in a certain fixed scale according to capacity, and where constant service has been introduced there are other methods of arriving at the same knowledge. The present plan is a mere makeshift introduced without any of those excuses which are supposed to justify a recourse to makeshifts.

Absurd as the system is, it might very possibly have excited no special outcry had it not been for the imprudent action of the Companies. People had come to regard the water-rate, not as the price to be paid for the supply of a necessary, but as a tax levied on the community. The method of charge was an irrational one, but they had grown accustomed to it. So far as the public have at all abandoned this attitude of patient indifference, the change has been brought about partly by the extravagant prices asked, and very nearly obtained, by the Companies from Sir RICHARD CROSS, and partly by the use which they have made of the Metropolis Valuation Act. Where municipal contributions are concerned, it is only fair that the distribution of the burden should from time to time be reconsidered. Otherwise, the houses which were fashionable a century ago would be condemned to go on paying for their ancient greatness, while others which may have only lately come into request would escape by reason of their former insignificance. But it is not at all fair that the water-rate should as a matter of course be assessed on the new valuation. If the aggregate value of houses in London remained the same, and an improvement in the rental in one part of the town were balanced by a depreciation in another part, the case might be different. As a matter of fact, however, the great majority of the changes are in the direction of increase. At every fresh revaluation houses, taken one with another, are found to be worth more than they were before. Consequently with every fresh revaluation the Water Companies will have a legal right to charge more for giving precisely the same amount of Thames water. This will be true whether Mr. DOBBS gains his cause or loses it. The issue which he has raised relates exclusively to the meaning of the word "value." It does not touch the right of the Water Companies to increase their charges in proportion as the value—however interpreted—is found to have risen when the period of estimating it recurs.

It is clear that Parliament ought, when the Metropolitan Valuation Act was before it, to have provided against the absurd consequences that have since followed from the measure. It is of more importance now, however, to insist that what Parliament did not do then it ought, so far as is possible, to do now. There ought not to be any great difficulty in passing a Bill which should compel the Water Companies to charge for the water actually supplied by them; but, if this is impossible, Sir WILLIAM HARCOURT might at least introduce a Bill forbidding them to raise their charges in consideration of changes in the value of houses which do not in any way affect the quantity of water supplied. Even the Irish obstructives would probably be merciful while such a Bill as this was under discussion.

## RAILWAY COMPANIES AND RAILWAY ACCIDENTS.

THERE are no cases that come before a court of law which, in point of theory, are less satisfactory than those which deal with compensation for railway accidents. That a kind of rough justice is dealt out which, on the average, keeps the balance pretty even between the public and the railway Companies it is allowable to hope. But this average is maintained by help of some pretty startling extremes on either side. It cannot be denied that juries are sometimes disposed to strain the law against the Companies; and that compensation is occasionally given for injuries which, with a very moderate exercise of caution

on the part of the plaintiff, need never have been sustained. To judge by some of the verdicts, it is taken for granted that when a man is crossing a railway, or getting out of a train, he ceases to be in any way concerned with the care of his own life or limbs. They have become for the time the property of the Company which is carrying him, and it is their business to look after them. On the other hand, the railway Companies have the immense advantage of wealth; and, no matter how lavishly or how uselessly they spend money in litigation, their shareholders never seem to have found fault with them. Two cases which have been before the courts this week afford excellent illustrations of this tendency on the part of the Companies. In both they have pushed resistance to a point, which probably means ultimate loss to themselves, while it almost certainly means ruin to the other party. No policy can, as it seems to us, be more shortsighted on the part of the Companies than one which is directly calculated to irritate future juries. When the amount of damages is under consideration in some coming case, a jury which has studied "*SMITHERMAN v. the South-Eastern Railway Company*," or "*WEBBER v. the London, Brighton, and South Coast Railway Company*," will be likely to argue that, as the Company is sure to resist the verdict to the utmost of its power, it will be well to give the plaintiff compensation, not merely for the injury received, but also for the trouble and annoyance to which he will be put in making good his claim to what has been given him.

In the first of these cases the plaintiff was a widow whose husband had been knocked down by a passing engine at East Farleigh Station. To get tickets for the down train it is necessary to cross the line by a level crossing. The deceased had done this, and was coming back over the level crossing, when he was struck by an engine which went through the station at the rate of thirty miles an hour, and was so injured that he died two days afterwards. The Company contended that the man had been guilty of contributory negligence, and it appeared that he had jumped down from the platform some yards short of the level crossing in order to reach it more quickly, and that, when in the act of jumping, the signalman had called to him to stop as the engine was coming through. On the other hand, the engine did not reach him till he had reached the level crossing; the servants of the Company had supposed that the lights of the engine were those of a stopping train which was then due, and had rung the station bell; and the engine of that train would have stopped short of the point at which the deceased was struck. The only thing, therefore, that could be called negligence on his part was his neglect of a warning which had confessedly been given when he was in the act of jumping from the platform, and which he might have been unable to obey. It will appear to most people that in these circumstances, and considering that the deceased was only thirty-two, was earning 40s. a week, and left four children, the railway Company was not very hardly dealt with when a jury gave the widow 900*l.* damages. A level crossing at a station is a different thing from a level crossing anywhere else. In the latter case it is maintained for the convenience of the public; in the former case it is maintained to save the pockets of the Company. This accident and many similar accidents would be avoided if the law compelled railway Companies to build a bridge across the line at every station. No doubt at small stations passengers would often cross the line instead of using the bridge, but if they did they would do it at their own risk. Where there is no bridge, they must incur the risk whether they will or not. In the present case passengers by the down train had to cross the line to get their tickets, and to cross back again possibly just in front of the advancing train when they had got them. This the deceased seems to have allowed for; what he did not allow for, and what till the last moment even the servants of the Company did not suppose that there was any need for him to allow for, was the passage of a stray engine through the station at the rate of thirty miles an hour.

The remarkable point about the case is that the verdict for 900*l.* was given in July 1879, and that ever since that time the railway Company have been fighting the case. A new trial was ordered in November 1879, and reversed in the following month by the Court of Appeal, on condition that the damages should be reduced to 700*l.* This partial

victory did not content the Company. They appealed to the House of Lords, and got a new trial ordered. The facts were gone into by a fresh jury this week, with the result that the original verdict—with the substitution of 700*l.* for 900*l.*—was sustained. It is tolerably certain that many people will think that one motive for thus contesting every stage of the case was the expectation that the plaintiff would not have funds to go on with it. It appears from a letter in yesterday's *Times* that, but for the help of the townspeople of Maidstone, this expectation, if entertained, would have been justified. The widow has only been enabled to obtain the second verdict in her favour by means of a local subscription. The Company, it is stated in this letter, threaten to appeal against the second verdict, as they appealed against the first, and to carry the case, if necessary, again to the House of Lords. In the case of *WEBBER v. The London, Brighton, and South Coast Railway Company* there has been a similar apparent determination on the part of the defendant to wear the plaintiff out by superior length of purse. He had been given 500*l.* as damages for injuries attributed to the negligence of the Company, and an order for a new trial, granted by the Divisional Court on the ground that the damages seemed excessive, has been set aside by the Court of Appeal. On Monday, the Company applied to the Court to stay execution pending an appeal to the House of Lords. The Court refused the application, and in doing so the MASTER of the ROLLS made some observations which railway Companies would do well to lay to heart. Three courts, he said, had found in effect that the plaintiff was entitled to damages and costs. That he was entitled to some damages the defendants themselves admitted. The plaintiff was a poor man and had been unable to employ counsel, and to stay execution would be to deprive him of the means of obtaining legal assistance in the House of Lords. The application was unanimously refused by the three Judges of Appeal; but, though execution has not been stayed, the Company can still go to the House of Lords if they choose.

In neither of these cases can the action of the Company do them any service in the long run. They are very much at the mercy of juries whose compensation for accidents is concerned; and it cannot be wise for them to make juries feel that they are a kind of public enemy. Of course a jury may give a grossly unjust verdict, and then no one will blame a railway Company for asking for a new trial. The imprudence lies in pressing the application through one court after another, on the chance that the ultimate decision may be in their favour. It is this policy that tends to predispose juries against railway Companies; and, in proportion as they follow it out, damages will be likely to become heavier. A railway Company ought to judge its solicitor's advice in these matters entirely by its first result. If the new trial asked for is at once granted, and if the second verdict is from the Company's point of view, a substantial improvement on the first, then the advice has been good. If the new trial is not at once granted, or if the second verdict is not an improvement on the first, the advice has been bad. In the latter case it is the plain interest of the Company to follow it no further. The possible chance of getting a verdict in their favour after all is not worth the risk of earning a reputation for a dogged determination to ruin the plaintiff if they cannot defeat him. This is a reputation which the two cases we have been considering are very well calculated to gain for the Companies concerned, and it is certainly not one which, in the long run, they will find serve their turn with a jury. It is as much in their own interest as in that of the public that we advise them not to go farther and fare worse.

#### MR. STREET.

A PEACEFUL and a prosperous epoch seemed to be commencing for the pursuit of architecture in England. Last summer, after an exciting contest, the Institute of Architects elected as its President—a virtually triennial office—one who was by universal consent foremost in his art, but who had conspicuously won his position as a decided partisan. Mr. Street, however, was no sooner installed in office than he took by storm both friend and opponent, as both sides now vie in generously proclaiming, by the broad, impartial, far-sighted view he took of the responsibilities of his office and the dignity of a profession in which he used his authority as peacemaker and reformer. Not seven weeks ago he made the annual public appearance which the Institute of

Architects exacts from its President, in an address "equally admirable in matter and manner. Now the friends who seem to have only just come home from burying Hargreaves are preparing to gather round the grave which is so deservedly being dug for Street in Westminster Abbey."

The fifty-seven years of Mr. Street's life, apart from the record of his works, were singularly uneventful—the chief public incidents being his election as R.A. in 1871, and as President of the Royal Institute of British Architects in 1881. The pupil at first of a country architect of a respectable but now forgotten reputation, he passed into the office of Gilbert Scott, whose assistant for some time he was, and as such helped him in the great church of Hamburg, which was the foundation of Scott's more extended fame. The date, some thirty-five years back, when Street set up for himself was a fortunate one for the man of genius who differentiated his title of architect with that of ecclesiologist; for just at that time the Cambridge Camden Society, under the fresh title of the Ecclesiological Society, and with London as its headquarters, braced itself up to more powerful exertions than such as it was capable of while still hampered with academic complications; and among its earliest recruits of that period Mr. Street was conspicuous. An opportune introduction to Mr. Butler, then Vicar of Wantage, led to Bishop Wilberforce placing in his hands the theological college at Cuddesdon, and naming him diocesan architect. For some years Mr. Street went steadily on making friends and winning fame in a special circle, till in 1855 he acquired a more general reputation as an author who was able to produce a book which was at once instructive and entertaining, on a technical subject, in his *Brick and Marble in Italy*, reprinted many years after with modifications. He maintained his fame as author by a subsequent volume on the ecclesiology of Spain, as well as by numerous articles in more than one periodical.

In the following year, 1856, he surprised, pleasantly or unpleasantly, the architectural world of Europe by appearing as second prizeman, with Messrs. Clutton and Burges as first, in that competition for Lille Cathedral at which France was making sure of coming out successful; and in the next year he stood in the same relation to Mr. Burges, then competing alone for the Memorial Church at Constantinople, of which the building ultimately fell to himself. He was also a prizeman, though not high in the list, in that strangely jumbled competition for the Public Offices, having produced a design probably superior in picturesqueness to any of the others, although we should imagine that official necessities had not been elaborately worked out by its author.

It would be impossible to follow any order of chronology in naming even the more conspicuous of Mr. Street's innumerable works. The church with adjacent buildings which he built at Boyn Hill, by Maidenhead, for Preliminary Grosley, was for some time his *magnum opus*. In London he was the author of St. James's, Garden Street, Westminster, built by the Miss Monks, of Mr. R. T. West's St. Mary Magdalen, Paddington, and of St. John's, Kennington. He also designed the remarkable reredos in St. Andrew's, Wells Street, of which the sculpture is due to James Hedderly, prematurely cut off just as he was becoming eminent. At Oxford he produced little besides the Church of St. Philip and St. James, and at Cambridge nothing at all. The church of St. Margaret, Liverpool, founded by Mr. Horsfall, embodies most admirably the principle which should inspire the architect of a town church. At Torquay, Mr. Street produced St. Peter's Church; and the singularly picturesque and varied, but eminently practical, church of St. Peter, Bournemouth, carried out by the zeal of Mr. Morden Bennett, probably owes its graceful peculiarities to the incident of its being the gradual result of substitutions, first at one point and then at another, in an earlier, smaller, and inferior structure, of which each portion successively disappeared. On the other hand, All Saints, Clifton, was built from the ground with no embarrassing conditions, and it is very successful in the spaciousness given to it by the bold breadth of interior proportions. In St. Saviour's, Eastbourne, on a rather smaller scale, Mr. Street has tried the experiment of a nave apsidally cut off at the angles, and of a chancel with a six-sided apse, so that, as at Caudebec, the extreme point of the interior is an angle. We should be sorry to see the example widely followed, though it is an experiment which may well have been once tried among so many churches.

Of purely country churches which he built, the most sumptuous is that which Lord Eldon has raised at Kingston, in Dorsetshire, exceeding any of the dozen so munificently raised by Sir Tacton Sykes in the East Riding. We do not attempt the barest catalogue of the country churches which Mr. Street restored. Of his scholastic buildings we can only point to those at Uppingham and Marlborough, and name the pile which he provided for the Sisters of Mercy at East Grinstead. His share in English cathedral restoration was Carlisle Cathedral; the south transept of York, undertaken with great spirit by Dean Duncombe; and that which was, in fact, an original work of great magnitude, the new nave of Bristol Cathedral. He drew his inspiration from the choir, a very beautiful specimen of Middle Pointed, with some notable peculiarities; but the judgment with which he followed, without servilely copying, their peculiarities lifts the work much above the class of imitation.

But his greatest achievements as a cathedral builder were in Ireland. Besides the smaller restorations of Kilkenny and Kildare Cathedrals, the resuscitation—in some features amounting to an original work—of the peculiarly beautiful and peculiarly ill-used Cathedral of Christchurch, Dublin, at the cost of

Mr. Roe, is one good thing among the many evil incidents of modern Irish history. Attached to the Cathedral stands the Synod Hall of the Irish Church, which is also by Mr. Street.

He has not left so much behind him in Scotland. Among the competitors in a limited competition some ten years back for the Cathedral of Edinburgh, so unexpectedly created under the will of a rich and taciturn spinster, were Street, Burges, and Scott. Had we been the judge on the occasion, we should have placed those architects in that order of merit. However, the popular verdict was strong for Scott, whose composition, as it is right to say, was much improved in the course of the construction. The chapel added by Lord Crawford to his house at Dunrobin, so fatally notorious of late, was Street's work. Abroad, besides the church at Constantinople, and some smaller churches in Switzerland and at Genoa, he built the American Episcopal Church at Rome, in which he attuned to a style which is a compromise between northern and southern Gothic, a mosaic treatment of the apse borrowed from basilican models. On his designs another church for the English in Rome is being built, and he was in charge of an American church in Paris. We have kept for special notice two works of late date. Within a hideous and seemingly hopeless shell, the Guards' Chapel in Birdcage Walk—a sham Greek temple of the George IV. taste—Mr. Street has built up a gorgeous basilica, harmonious in proportion, rich in fittings, correct in arrangements, while the only outside sign of the internal work is an apse. An eminent member of the Reichstag was visiting this church some weeks ago, and on his ecclesiological guide explaining to him that this was no "ritualistic" proclamation, but a church which had been cast into its present form with the cordial co-operation of high dignitaries, military, ecclesiastical, and civil, answered, "Vous avez vaincu."

For once Mr. Street worked for himself. At Holmbury, in Surrey, on a spur of Lenth Hill overlooking from its fir woods the rolling Weald of Sussex, he made for himself a country house designed with a felicitous adaptation of later English mediæval forms, and near to it constructed a parish church, carefully studied so as to be at once simple and rich. The bell-cot and other features recall the style of the county. A wooden screen cutting off an internal narthex is well conceived, and the elevation given to the north chancel aisle by a crypt employed as sacristy is original and practical.

In all Mr. Street's churches the individuality which proceeds from special thought is conspicuous. He had very decided preferences both of architectural style and ecclesiological arrangement; but he made these his instruments, not his masters. In particular, the broad distinction between town and country church was never more emphatically marked than in his work. No one, either in joke or seriously, thought of hinting, in reference to anything that bore his name, that it was really designed by "the gentleman in the office." His allegiance, on the whole, and particularly in his latter days, was loyal to English Gothic. He had passed, like other men, through that phase—fostered, in his case, by his successful literary advocacy—of admiration for Italian Gothic, not as a graceful exotic, but as a desirable style for the soft climate of England, of which the root may be found in the writings of Thomas Hope, Willis, and Ruskin. Of this episode of his life the church of St. James, Westminster, is the most conspicuous example. But from it he soon and completely emancipated himself. To the massive Early French, which exercised so remarkable an influence on the mind of Burges, he never displayed any leanings.

We have spoken fully and often of the series of events which led to the selection of Mr. Street as architect of the Law Courts, and this is no time to hark back upon extinct controversies. These Courts are the great work of a great man. Enough of them has been built to show how full of variety and beautiful detail they are. But, until the crest has been put upon the roof of that lofty central hall which is to be the crown within and without of the present pile, appreciation of the building as a whole is premature. Even then Street's real conception will only appear in a truncated form. A tower of peculiar massiveness and grandeur was a conspicuous element of his design, and had it been built, it would have stood out as one of the capital features of the London landscape. But *aliter visum* to Mr. Ayrton.

It is only a short time ago that any one conversant with the artistic politics of the day would, if asked to name the architects who had in the course of the competitions, official or unofficial, which were at that time in higher favour than they have since become, taken the foremost position as competitors, if not as combatants, have undoubtedly put in the front line Digby Wyatt, Scott, Edward Barry, Burges, Street, to name them in the order of their departure. Now all of these are dead, Scott only just an old man, and the rest in middle age. Every one of the men, in fact, over whom any real battle at that time raged has, with the exception of Mr. Waterhouse, left the scene. The *Times* attempted to sketch, with a keener eye to faults than merits, the difference between the old and the new taste in architecture by pairing off Mr. Street with Mr. Decimus Burton, who had died a few days before aged eighty-one. The comparison might have been more telling if it had included a third architect, who died on the very day before Mr. Street, and who was, although a year older than Mr. Burton, rather the first of the new than the last of the old school. More than forty years ago, when prominent men of the Gothic school who have since been famous and died were still unheard of, Anthony Salvin seemed destined to lead the revived school of mediæval art. But he was rather torpid in

the important matter of ecclesiastical architecture, and so, while making proof of his mastery of castellated construction at the Tower, at Windsor, at Alnwick, and in his own modern castle of Peckforton, as well as of considerable taste in country houses, he practically became an outsider in the animated conflict of styles which has filled up the intermediate years.

There is never an effect without some cause, and it is better to seek what explanation can be given for the remarkable shortness of life among conspicuous architects than idly to lament the losses. No doubt, as the phrase goes, it is the pace which kills; but there is something more than the mere speed to account for the dangers and the casualties of the architectural race. The nature of the broken country which has to be crossed tells against safety as much as the mere speed. Some men kill themselves by over-devotion to an art, and others by over-devotion to a profession. But it is the hard and peculiar fate of an architect to be following both an art and a profession. His education in composition matches with that of a painter in painting. His education in construction matches with that of an engineer in engineering. Once he is in practice, the thought needful to marry beauty with utility in his designs is only the beginning of troubles. He has to settle his accounts with employers who may be stingy and overreaching, exacting and capricious, ignorant and prejudiced, vain and half-instructed, with contractors too often incompetent, dishonest, or insolvent, with workmen too stupid to understand and too obstinate to obey. Add to this the wear and tear of railways, the severities of weather, and it will be seen that the career of a successful architect is one which tells with unusual severity on the human frame. Yet there is no remedy which could be thought of which would not be worse than the disease. To separate the professions of artistic and of constructive architect would be to extend and to perpetuate a system which has already, in the hands of speculative builders, worked so much woeful mischief to the national taste.

#### CHRISTMAS ARTICLES.

CHRISTMAS is pre-eminently the season of fictitious demand and redundant supply. The article of jollity is not really in the market to any great extent, but we are obliged, like the poor little Marchioness, to make-believe very much; otherwise tradesmen, publishers, printers, butchers, newspaper proprietors, and all that class of people, would suffer severely from the loss of their early illusions. They have been brought up to believe that the world about the end of December wants an immense and well-selected assortment of festive commodities, and these they make it their business to supply. No doubt this illusion is good for trade, and these are not times in which we would willingly check the circulation of the current medium, or deprive one dealer in turkeys, or Christmas cards, or geniality of his cherished and profitable beliefs. Christmas cards, indeed, we incline to regard as a step in the right direction. It is familiar to the student of history that bad old institutions die slowly, and, as they pass away, pretend to survive in the shape of symbols and effigies. Thus, in time past, it was customary to effect a change of Ministry by getting at the king's adviser and cutting off his head, or starving or torturing him to death. Now the Prime Minister is only burned, in Natal and elsewhere, in effigy. The early people of India were accustomed to sacrifice human victims; but they gradually satisfied themselves by tying men to the sacrificial posts, and then cutting them loose again. The Chinese once buried money and objects of price with their dead; now they bury a valueless collection of bits of gilt paper, even slimmer than the funeral gold of the early Italians. Christmas cards answer to the Chinese gilt paper. They are cheap substitutes for the more valuable Christmas-boxes of the past. People who send them believe that they are fulfilling a pious duty, at the most moderate expense. People who receive a gaudy print of a girl of twelve in very scanty clothes, or a representation of a bunch of roses in a blue and white bowl, also glow with the sacred fire of friendship. "Does my old friend remember me?" we ask, like the man in Mr. Tennyson's poem, and Christmas proves that he does remember us. His kind recollection no longer takes the coarse shape of a turkey—a thing that to-day is and to-morrow has ceased to exist—but becomes imperishable in the form of cheap art, in the guise of pasteboard and chromolithography. In this there is a great advance. When all Christmas gifts have dwindled to the paper money of the affections, even that will slowly drop out of use, and Christmas will have become, if not more gay, at least more economical.

Christmas cards, gifts which are no gifts, are only one feature of our fictitious revelry. Christmas books, books which are no books, are a more solid example of the shams of the happy season. But many otherwise harmless persons support life by producing the letterpress and the illustrations of these tomes. By them, too, is the bookseller nourished. Nothing so good can be said about the Christmas leaders in the newspapers. These mournful strains bless neither him that writes, nor him that commands them to be written. As to him that reads, we do not believe that such a student exists in the nature of things. The conductors of newspapers are of all people most the slaves of habit and tradition. There is no anniversary so tiny, or so unregarded of the people, that newspapers do not publish articles thereon. It is impossible to suppose that any member of the intelligent public actually reads four times a year a column and a fourth of twaddle about Bank

Holidays. But the twaddle is always presented in the gravest manner. The University Boat-race, again, throws a gloom for months over the life of the serf who has to "write 'in the air'" about the Isthmian Games, the River Derby, the playing-fields at Eton, and the rest of it. The Twelfth of August, the First of September, the beginning of pheasant-shooting and of fox-hunting, the commencement of the London season, are all celebrated in annual prose hymns which might just as well be "taken as read." The great British public scarcely knows a grouse from a partridge, and has never seen either on the wing, or a fox anywhere but at the Zoological Gardens. The great British public is no more concerned in the entertainments of the season than in those which accompany the election of the Great Lama of Thibet. Probably the leader-writer himself only knows of them through the dim glass of society novels and society newspapers. Yet all these and a dozen other exhausted, uninteresting, annually-recurring topics are commented upon with admirable gravity. The Tartars who churn their written prayers round and round in a little mill are wiser in their generation than the newspapers. They do not fatigue unlistening ears with articulate iteration, and a kind of mute leader-mill for grinding the articles on anniversaries might wisely be introduced, with the telephone and the machine that turns out telegraphic tape, into newspaper offices.

Christmas is, of all occasions for writing, the most utterly exhausted. The subject is treated yearly in perhaps three hundred English prints, and it is wholly and hopelessly threshed out. There are, to the best of our knowledge, but three ways of getting through a Christmas article—unless, indeed, the scribe says no more about Christmas in his paper than Montaigne does about "coaches" in his essay with that heading. The first and oldest and safest way is the genial descriptive. The first paragraph deals with frost, snow, and holly; the next with happy families making idiots of themselves about the Yule log; the third with the condition of the poor who have no Yule log, and whose condition the reader is expected to remember in a generous and charitable style. There is no harm in this kind of article, except that any sensible man, woman, or child would scarcely hold the ideas to be worth thinking which the exhausted author is constrained actually to print. In some quarters this sort of literary fare is flavoured with emotional pietism. We read of "cradles" and of the "storms which hush themselves around a manger." But this suspicious kind of sentiment has never been very common, and is less flagrant than it was some four or five years ago. The second sort of Christmas article is the cynical one. The first paragraph deals with rain, fog, slush, and Christmas bills. The second regrets the convention which unites those natural enemies, brothers, sisters, and cousins, around the hearth; the third deploras the British conception of a holiday, and describes the rueful crowds that trample without an object or an aim up and down the black and cheerless streets. About this cynical sort of article the writer may perhaps say, as Mr. Swinburne's Mary Stuart does about her imprudent letter:—

I did not ill to write it, for God knows  
It was no small case to my heart.

But there is no other good thing to be said about the cynical Christmas article. The third sort of Christmas article is harmless, but tedious; it is the archæological, anthropological, folklore kind of composition. Christmas is a survival of the feast of the winter solstice. Here you introduce Balder, Persephone, the fire through which cattle pass to Moloch, the evergreens hung up in churches and houses, the mystic origin of plum-pudding, the natural history of mistletoe, the esoteric virtues and hidden past of snap-dragon, the cattle talking in the stall, and all the other lore of Brand's *Popular Antiquities* and Hone's *Every Day Book*. The worst of this kind of lore is that every one knows all about it already, except the correspondents of *Notes and Queries*, so remarkable for the extent and variety at once of their curiosity and their ignorance. Beyond these three ways of writing a Christmas article, we doubt if the ingenuity of man has discovered another, unless it be the Boswellian or absurdly problematic. Every one remembers how Boswell, rather than hold his tongue, would ask Johnson ridiculous questions, such as "What would you do, sir, if you were shut up with a baby in a tower?" Now there is a way of getting through a Christmas article in this fashion. You ask yourself where all sorts of luckless Christians may chance to be on December 25, and further interrogate your consciousness as to how they keep Christmas in difficulties. Thus the fancy may explore Christmas on an iceberg, Christmas in the Bank of England, Christmas in a boycotted house, Christmas in a Nile boat, Christmas in an Indian gold-mine, Christmas in a lighthouse, Christmas in a lion's den (like that of the boy who was left all Christmas in the snakes' house of a Zoological Garden, and "doth now an idiot go"), and other queer Christmas scenes that will occur to the tortured imagination.

It cannot be expected that these literary articles of Christmas will be very admirable as compositions. If a man has to do six every year, for as many journals, his fancy's wings will weary, and he will not only bore his reader (if he has ever one reader), but will be conscious that he is boring him. The only remedy is the seemingly impossible one of saying nothing about Christmas at all. There is nothing to be said about it. Apart from its religious aspect, of which there is naturally nothing to be said in this place, Christmas is a festival of children and the poor; a melancholy anniversary, our *jour des morts*, for folk who are neither very young nor very

callous. Let us treat Christmas as, according to Jacques Sadear, the Australians treat their god Haab, and make it impious to say anything on the subject at all. In town Christmas is only a big, prolonged, miserable Bank Holiday. In the country things are not so bad; but the less we say about them, and the less we rake up our consciousness on the subject of this, as of other anniversaries, the better for ourselves. Our modern incontinence of printed words on all topics is particularly deplorable at Christmas-time. Nobody wants lay sermons on the subject, and the supply would be too great for even a large demand.

#### THE JEANNETTE.

THE news of the loss of Mr. Gordon Bennett's Arctic exploring vessel *Jeannette*, and of the preservation of at least the greater part of the crew, adds a very interesting detail to the history of Arctic exploration, and comes somewhat appropriately at the time when efforts are being made in England to send assistance to an Arctic explorer of our own. That the *Jeannette* is none other than Sir Allen Young's famous yacht, the *Pandora*; that she was bought and fitted out on the *per mare per terras* principle by the enterprising proprietor of the *New York Herald*, in order to match and, if possible, excel the glories of the Livingstone search expedition; and that she disappeared from human ken about two years ago, may be presumed to be facts known to most people who take the least interest in geography, and especially in the quest for almost the last of the earth's yet unconquered secrets. The nature of the course, however, which the *Jeannette* took, and the conclusions to be drawn from her failure in that course, are matters not quite so generally accessible to the ordinary reader. A glance at the map will show that through the continents of the Old and New World there are three entrances, and three only, to the region of the North Polar Seas. The widest, the nearest to Europe, and latterly the most generally tried, is the broad gap between Greenland and Norway, in the midst of the south of which lies Iceland, with the solitary speck of Jan Mayen and the archipelago of Spitzbergen further north. The next is the passage on the western side of Greenland, which has been the most thoroughly explored of all, and which has as yet brought explorers nearest to the Pole; though, after many centuries of comparatively unsuccessful voyaging to the east of Spitzbergen, the discovery of Franz Joseph Land by the Austrian explorers some years ago made this latter approach once more the favourite. The *Jeannette* did not try either of these approaches. Mr. Gordon Bennett has, until the late telegrams, been convinced that his ship was "sailing over the Pole"; and it would apparently have given him particular pleasure that this feat should be achieved by the only route possible to a ship without touching at, or at least passing by, territories which are not parts of the United States of America. Accordingly, the *Jeannette* started from San Francisco and tried the route of Behring's Straits. No one possessing the slightest geographical knowledge is unaware that this route has drawbacks from which the others are free. No such equatorial current of importance passes northward through Behring's Straits as that which runs through the gap eastward of Greenland; and, whereas the passage north of Baffin's Bay is hemmed in by an almost continuous series of islands of great size, the sea north of Behring's Straits is apparently for the most part open. Accordingly, while *terra incognita* has advanced on the other routes far beyond the eightieth parallel, almost everything beyond Latitude 75° is, in the district immediately north of Eastern Siberia, a blank. Among the few exceptions to this rule are, just beyond the Straits and to the west of them, Wrangel Land and Kellet Land; while further west the Liakhov, or New Siberia, Islands, well known for their deposit of fossil ivory, have long been marked on the map. Further westward, still on the return towards Europe, the far-jutting promontory of Cape Severo stretches out from the mainland; and the voyager round it comes before long to Nova Zembla, if he is bound towards the haunts of men, and to Franz Joseph Land if he journeys towards the Pole. No man has yet made that latter journey in this direction, though, by hugging the land, the *Vega* achieved the North-East passage in the opposite sense. The *Jeannette* evidently intended to try the other way, though the experience both of explorers and whalers left very little hopes of her being able to achieve it.

She seems, however, to have made a gallant effort to carry out her orders, and to have in every sense done credit to the care and expense laid out on her equipment. On the 3rd of September, in 1879, she was seen by a whaler steering for Wrangel Land, past Herald Island, a small islet nearer Behring's Straits. From what is known, it would appear that she then kept to the north of Wrangel Land, instead of going through Long Strait, and boldly plunged into the Arctic Ocean. If so, her progress was soon stopped. Wrangel Land is in Longitude 180° and Latitude 71°; in Latitude 77° and Longitude 157° (and the degrees of longitude are of the shortest in that part of the world) the ship was caught and crushed. It is noteworthy that, though nearly two years had passed since she was seen by the whaler, not more than three or four hundred miles at the outside can well have been traversed. Allowing for two winter halts, the progress actually made must have been very small; indeed, in the summer of the present year none can have been made at all, as the ice must only have been in process of breaking up (a process fatal to the *Jeannette*) by the end of

June. The spot in which the ship was abandoned was immediately to the north and a little to the east of the Liakhov Islands, and the crew took to their boats. It was not quite clear from the first telegrams whether they journeyed over the ice in the usual boat-sledge fashion, and took to the boats themselves fifty miles from the Lena, or whether they were able to float at once, and separated when at that distance from the great river of Eastern Siberia. The former seems to have been the case. Two out of the three boats struck the outermost cape of the delta which guards the Lena's mouth, and from thence made their way to a village where the barbarous people seem to have used them kindly. The third boat is not reported; but as at the date of arrival, in the middle of September, the water should have been tolerably open, there is ground for hoping that it may turn up at some other point of the Siberian coast. This coast, lined with the curious region of the *Tundra*, where all the migratory birds of all the world make their nests in the brief summer, is not exactly thickly inhabited, but it is nowhere utterly desolate at that time. Unfortunately news travels but slowly in these out of the way regions, and though the boats touched land in the middle of September, the news of their arrival has only just reached St. Petersburg. Everything that can be done has been done by the Russian authorities; but it is of course impossible to send any expedition to look after the missing boat in the depth of winter. The condition of the rescued sailors, moreover, is not encouraging as to the probable fate of others who might have to go through a third winter of hardship. Still, the major part of the crew have been recovered, and the exact achievements of the vessel itself have been made known. That they were not greater will not surprise those who are acquainted with the results of the Behring's Straits route. Everything in Arctic exploration (leaving the mere hypothesis of a central open sea out of the question) depends on making a deep plunge on shipboard into the guarded region before it is necessary to take to sledges or boats. More than two years' travelling, it is now seen, had not carried the *Jeannette* much within half a dozen degrees of latitude of the "furthest" achieved by way of Franz Joseph Land and Smith Sound. It is true that the condition of these strange regions varies astonishingly from year to year. But the results of centuries of adventure *via* Behring's Straits have been uniform. There can be no doubt since the voyage of the *Vega* that the coast of Siberia can be traversed by ships, it may be with good luck, in a single season; but the results of stretching northward have never been encouraging, and are now less encouraging than ever.

The rescue of the crew of the *Jeannette* ought to lend new energy to those among us who are endeavouring to have succour sent to Mr. Leigh Smith. Had matters gone well with the American vessel, she and the *Eira* might have met before now in Franz Joseph Land, and the latter might have brought happier news of her than has now been received. Such a meeting is impossible now that the timbers of the *Jeannette* are scattered hundreds of miles to the eastward on ice untrodden before and not likely soon to be trodden again. But the *Eira* and her owner remain unaccounted for, and in a position much more perilous than was that of Lieutenant De Long and his crew. The latter had a larger and stouter ship, were much nearer, if not to civilization, at least to countries where there is a population permanent, if sparse, and were definitely provisioned for a long stay in the wilderness. It is known that Mr. Leigh Smith had no provisions which will outlast next summer, and that he therefore cannot stand the perilous chance of a possible opening of the ice next August or September. The fuller account of the news brought by the Norwegian Captain Isaksen, who saw him last, shows that in all probability the *Eira* reached very high latitudes last summer. In the middle of August the sea was open far north of Nova Zembla, and, what is more, was running freely from the northward. He is therefore likely to have been tempted much farther north than in an ordinary season, and to be subjected to a new temptation in case of the repetition of an open season this year. A steamer sent at the proper time in the late spring might thus not improbably enable him to achieve a brilliant voyage, and may in all probability be the only means of saving him and his crew from the risk and hardship of a boat-sledge journey across the ice; while in the case of his being exposed to that risk, depôts on the northern coast of Nova Zembla would be almost necessary to secure a chance of safety. For it cannot be too much remembered that Mr. Leigh Smith intended no prolonged exploration on this occasion. Had he done so, it would be superfluous to feel any anxiety about him for another year at least. His plans did not extend beyond a foray into the Polar regions, such as he had made before with success and with profit to geography. The very circumstances, therefore, which to a well-equipped expedition would have been a stroke of the highest luck—the freedom from ice of the Barentz Sea, and its tempting condition for navigation in the late summer—are likely to have been an occasion of evil in his case. His own experience, too, shows that such a relief expedition as is suggested need neither be extremely costly nor organized on any very elaborate scale. A well-equipped steamer might certainly hope to make Eira Harbour as well as all likely places of call further south in a trip of a few months, and to leave at these places the necessary depôts. For this is another advantage of the Franz Joseph Land route that, whether it be or not more likely than another to lead to the Pole, it is certainly that one which is, as a rule, open furthest in an ordinary year, while it

is also the nearest to the ordinary bases of exploration and relief. It cannot seriously be contended that succour supplied in such a case is an encouragement to rash enterprise; for the enterprise is not of a kind to be undertaken, except by an infinitesimal number of people. The experience and the success which Mr. Leigh Smith has had in Arctic travelling relieve him altogether from the charge of rash intrusion into a region where he had no business. When the United States are rejoicing at the rescue, as yet partial only, of the crew of the *Jeannette*, it is certainly not too much to ask that England should take some means to guard against a possible disaster in the case of the *Eira*.

#### INDIAN FINANCE.

THE Marquess of Hartington, in his recent speech to the Manchester Chamber of Commerce, pronounced the rumours which have lately been telegraphed to the *Times* by its Correspondent at Calcutta as to the intentions of the Government of India in connexion with the next Budget to be not only "premature and unauthorized" but "extremely inaccurate." Notwithstanding this intimation, there is quite enough in Lord Hartington's remarks and in the probabilities of the case to show that, however inaccurate the rumours in question may be in regard to particular details, they are by no means destitute of foundation as respects the leading fact alleged—namely, that the entire abolition of the duties on cotton goods and the imposition of further direct taxation are at the present moment under the consideration of the Government of India. Lord Hartington's reference to the anomalies which have been produced by the partial remission of the cotton duties, and to the still further anomalies which would be produced by any other partial remission, and the emphatic approval with which he quotes the arguments advanced by Sir John Strachey three years ago in support of his pet project of entirely abolishing, not only the cotton duties, but the whole of the Indian Customs duties, make it tolerably plain that, although the advent of the late Finance Minister's fiscal millennium, when "the ports of India will be thrown open freely to the commerce of the world," and when the "convictions of a lifetime" will be realized, may have to be postponed for a few years longer, it will not be the fault of the present Secretary of State if the duties on cotton goods shall continue to find a place in future Indian Budgets; and, if the cotton duties are to go, it will be difficult to avoid resorting to further direct taxation.

In the financial year 1875-76, when the first attack was made upon the cotton duties, the revenue derived from these duties amounted to 850,000*l*. What now remains does not probably exceed 500,000*l*. The loss of this latter sum would of course be inconvenient; but if the cotton duties only were concerned, it might be possible to dispense with it without resorting to any other kind of taxation, trusting to the normal increase in the productiveness of other existing sources of revenue. The opium revenue for the current financial year has been estimated at a figure considerably below the actual revenue of any one of the last three years, and, if the estimate should be exceeded as much as may not unreasonably be expected, the difference would more than make up for the loss caused by the abolition of the cotton duties. But it is not probable that the abolition of the duties on cotton goods will be resolved on without a careful review of the other duties included in the Indian Customs tariff. Lord Hartington speaks of the protective character of the cotton duties; but this description is only applicable to a comparatively small proportion of the existing duties, inasmuch as the Indian mills do not, at present at all events, compete with the manufactures of Lancashire in respect of the finer descriptions of cotton goods. The greater portion of the cotton duties which still remain are probably less protective than some of the duties levied upon other articles of import. At present, moreover, upwards of half a million of revenue is drawn from an export duty upon rice. Owing to the fact that India has to a great extent the command of the markets of the world as regards this staple, this particular export duty is not really open to objections of a practical kind; but it will nevertheless be an anomaly if an export duty upon one of the chief products of the country is retained, while a great part of the import duties is abolished. It is probable, therefore, that the abolition of the duties upon cotton goods will be accompanied by the removal of other Customs duties.

Again, it would be difficult to justify any considerable reduction of the Indian import duties unless that reduction were accompanied by a revision of the system of direct taxation at present in force. If the import duties are abolished or are largely reduced, unless an Income-tax be imposed, the wealthier classes, European and native, will practically cease to contribute to the general taxation of the country. It may further be conceded that it is wrong in principle that there should be any direct Imperial taxation of which a tax upon the incomes of the rich does not form a part. Four years ago direct taxation for Imperial purposes was re-introduced into India in the shape of a tax upon trades throughout the country and a rate upon the agricultural classes in the Bengal Presidency, with the avowed object of providing an insurance against famine. In the first year in which these taxes were in force, the revenue yielded by them was entirely absorbed in the charges of the Afghan war and the heavy loss by exchange. Two

years afterwards provision was made for the exemption of the poorer traders, and a Bill was introduced for imposing on the official and professional classes a tax analogous to the tax on trades, but was subsequently withdrawn. It would be difficult to devise a system of direct taxation more uneven and apparently unfair than the system at present in force in India. While the agriculturists in the provinces forming the Bengal Presidency contribute 700,000*l*. a year to the so-called Famine Insurance Fund, the agriculturists in Madras and Bombay pay nothing to that fund. The traders throughout the country whose profits are assessed at 50*l*. a year are taxed, but the officials and professional men and the owners of realized property are exempt. These anomalies do not pass unobserved in India, and they are certainly such as to demand a very careful revision of the present system of direct taxation, if taxation of that description is to be maintained; but the wisest course undoubtedly would be to remove all direct taxation from the Indian Budget, so far as regards Imperial as distinguished from local taxation, and to maintain the Customs revenue undiminished, removing the anomalies which have been caused by the partial exemptions already sanctioned, either by withdrawing those exemptions or by imposing upon cotton goods all round a somewhat lower rate of duty than that now charged upon the higher classes of goods. This is the course which would be adopted by any body of sensible men looking only to the peace, prosperity, and content of the people of India, and uninfluenced by personal crotchets or by the exigencies of political life in England. Unless something of this kind can be done—and it is perhaps hopeless to expect that it will be done—there will probably be no alternative but to reimpose the Income-tax, notwithstanding its unpopularity and the very serious objections which attach to it from a political point of view.

The political objections to an Income-tax as a source of Indian revenue have all along been strongly felt by the great majority of Indian officials, as well as by such men as Mr. James Wilson, Mr. Laing, and Mr. Massey, who have gone out from this country to administer the Indian finances. Mr. Wilson, who was the first to impose the tax, was emphatic in his declarations that the Income-tax was only imposed for a particular exigency which demanded additional resources. Free-trader as he was, the last thing he would have thought of would have been to impose such a tax for the purpose of getting rid of the duties on cotton goods. His immediate successors, Mr. Laing and Mr. Massey, were equally clear in their condemnation of the tax. Mr. Laing told the Select Committee of the House of Commons in 1872 that the Income-tax had caused "ten times more discontent in India than all the local taxes put together." Mr. Massey told the same Committee that his objections to an Income-tax were so strong that "nothing would induce him to hold office in India as the Financial Minister if the condition imposed upon him by the Secretary of State was the maintenance of an Income-tax as an ordinary source of revenue"; and, unpopular as the tax is at all times, we may be certain that its unpopularity will be greatly enhanced on the present occasion by the circumstances under which it will be imposed. The Income-tax will now come, not as a war tax, nor as a famine tax, nor as a tax which has been imposed for a time in order to defray the charges entailed by some other exceptional calamity, but as an obnoxious tax, abandoned several years ago after very careful consideration, and now reimposed to meet a deficiency caused by the relinquishment of a long-established branch of taxation which nobody in India feels, and which no one in that country wishes to get rid of. It will henceforth be regarded by the people of India as a burden laid upon them by the political exigencies of successive English Governments which feared to incur the risk of an adverse vote from the manufacturers of Lancashire.

And here it must not be forgotten that the considerations which rendered the imposition of direct taxation for Imperial purposes in the time of Mr. Wilson and his successors a measure of very questionable expediency have acquired far greater force in recent years, from the fact that since that time a vast system of local taxation, much of it direct, and some of it precisely similar to the Imperial taxation now in force, has been spread over the country. Nor should it be overlooked that the present critical juncture in home affairs is hardly a good time to select for carrying out in our Indian dependency measures which are certain to provoke widespread discontent. Lord Canning's remark that, "danger for danger, he would rather risk governing India with an army of 40,000 Europeans than he would risk having to impose unpopular taxation," is hardly less applicable to the India of the present day than it was to the India of 1861. These are facts which no prudent statesman can afford to ignore. It may well be doubted whether they do not greatly outweigh the possible gain, in an economic point of view, of removing the very moderate restrictions which at present affect the trade of India. The *Times* Correspondent in his latest telegram refers to official reports recently made by the Boards of Revenue of Bengal and the North-Western Provinces on the working of the Licence-tax on traders, which show "how distasteful it has been to the people, and with how much oppression it has been enforced." Similar objections would probably be made in India with regard to any direct tax; but those objections are greatly increased when the tax takes the form of an Income-tax, partly owing to the inquisitorial nature of the impost, and partly because, as an engine of oppression and extortion, it is far more powerful than a Licence-tax; for the practical operation of an Income-tax in India cannot be measured by its legal incidence. For every thousand persons who are legally liable to

the tax, it is within the mark to assert that another thousand have to pay something to escape being assessed to it.

Lord Hartington at the beginning of his speech adverted to what he described as "the somewhat Utopian hope" which is sometimes expressed, that the affairs of India may be kept altogether outside the pale of party politics; and he went on to observe that questions of great and imperial importance, such as questions of foreign relations, of peace, war, or annexation, whether they affect India or any other dependency, must always be treated as political questions; at the same time expressing the opinion that in Indian questions of internal administration, fiscal or other, party politics should, as far as possible, be kept aloof. The only objection which we have to offer to these remarks is that they tend to draw attention away from the fact that, in the particular matter with which Lord Hartington was dealing, the operation of our political system has led two successive Governments in England to commit themselves to a measure which seems likely to cause very serious embarrassment in our Indian administration, and which we may be certain neither of these Governments would have adopted if they had felt themselves free to deal with the question on its merits. Nobody can justly complain of the operation of party politics because a Government enjoin a particular policy which it believes to be demanded by the interests of the Empire or of one of its dependencies, however much we may dislike or distrust the policy. It has never been alleged that the policy of either of the two great parties in the State in relation to Afghanistan was dictated by party considerations. The Liberals, as a body, held, and still hold, that the policy of non-interference with Afghanistan was the policy most conducive to the interests of India, as well as to those of England. The Conservatives maintain that that policy, right up to a certain period, has, owing to the progress of events, ceased to be a safe policy. In both cases the leaders of the respective parties have acted upon their respective views of the merits of the case. The only way in which our system of party government has influenced the decision of this question has been by replacing in office a set of men holding one view of the question by a set of men holding the opposite view. It is quite conceivable that Indian questions of internal administration might be similarly influenced by the views entertained by successive Governments in England, just as they are constantly influenced by changes in the *personnel* of the Government in India. The complaint which is made by those who hold that on the question of the cotton duties party politics have operated injuriously to India is that in this matter the decision has been based, not upon what the Government in office believed to be the merits of the question, but upon the probable effect of that decision in securing to, or alienating from, the Government a certain number of members of the House of Commons.

#### A RENAISSANCE OF COMPLETE LETTER-WRITING.

"COMPLETE Letter-writers," says a Complete Letter-writer whose work is before us, "are often suspected of being worse than useless," for reasons which he proceeds to give. The chief of these are the "ridiculous style" and the "obsolete epithets" used. Our Complete Letter-writer accordingly resolves never to be ridiculous, and not to use any obsolete epithets. The result of this, it seems, will be that "the present prejudice against Letter-writers will disappear." The epistoler in question, it will be obvious, does not think small beer of himself. It is rather curious to find that he is a very composite epistoler. Externally he looks as if he were one; but the tell-tale evidence of head-lines and type reveals the fact that he is a conglomerate, consisting of "Beeton's Complete Letter-writer for Ladies," "Beeton's Complete Letter-writer for Gentlemen," and, in quite different type, a section of love-letters, which repeats much of the contents of the earlier parts, but makes amends by an appendix of proverbs, quotations, and so forth, for use by lovers in conversation and correspondence. As not unfrequently happens, the parts of the mixture sometimes rather "swear" at each other. Thus the author of the preface accepts bluntly the fact that everybody wants to save time and trouble, and therefore professes his epistolary common form as an assistance in this attempt. On the other hand, the author of the introduction deprecates the decay of letter-writing and the neglect of the art in schools, and seems to hold himself up as a guide to would-be Mmes. de Sévigné and Cowpers. This latter person, however, is not quite such a master of English or of logic as perhaps he should be. For instance, he says that "in olden days correspondence cost money, and a letter was a letter in those 'franking' days." Possibly the Letter-writer does not know what a frank was; but, if he does, it is certainly odd that he should clench his assertion that correspondence formerly cost money by showing that it frequently cost nothing at all. However, these are only the fringes of the book; the substance of it is to be found elsewhere.

Not the least pleasing part of the volume is the table of contents, which really displays considerable forethought and much imagination on the part of the compiler. Thus, under "Invitations," we have "An Invitation to an Acquaintance from the Seaside," with acceptance and refusal all complete; "An Invitation to Spend the Winter in Town," ditto, ditto; "An Invitation to a Lady to meet a Friend from Abroad"; "A Reminder to a Lady of Former Intimacy, with an Invitation"; "An Invitation to a Lady under Painful Circum-

stances"; and all these have each its affirmative and negative answer—a considerable abundance, which suggests that the intellectual apparatus of the Letter-writer's client must be *ex hypothesi* of a very remarkable order. "I can do it in oxen, sir, but I can't do it in sheep," was the reply of a small boy once to a hard-hearted instructor who, out of mere malice and pure caprice, had changed the terms of a Rule of Three sum. So is it with the Letter-writer's clients. Although they have been painfully taught how to do it in oxen—that is, how to accept or refuse invitations to ladies under painful circumstances—it is necessary to go over the ground again with them when they have got to accept or refuse an invitation from a lady who asks them to come and see her when they have just returned from abroad. The section of "Commissions" is fortunately short, though we do not see why the Letter-writer should have given any encouragement to the levying of that worst of taxes. Then we have "Letters to and from School" in great numbers. "From a Schoolmistress complaining of one of her Pupils"; "From a Lady to her Daughter respecting a Schoolmistress's Complaint"; "Answer to the above Penitently." Here the evil-minded reader grows languidly excited, in hopes that the set will be completed (as it clearly ought to be) by "Answer to the above Impenitently," which might be amusing. But the Letter-writer is false to his trust, and lets his opportunity slip. A whole batch of applications for and from cooks and housemaids requires no particular comment, and then comes what is always the solid of these feasts, "Correspondence with a View to Matrimony." Here the inauguration of the model writer and his knowledge of the changing scenes of life is racked to the utmost. "To a Gentleman, almost a Stranger, who has Proposed"; "To an Admirer whom a Lady has seen on Several Occasions"; "Writing to a Lover on Christmas Eve"; "From a Maidservant answering a Cool Letter from her Lover"; "Answer to a Missionary's Proposal Affirmatively"; "Answer to a Missionary's Proposal Negatively." The only wonder is that this exploration of the various relations of human beings ever comes to an end. One thinks of an anecdote which is drawn from no very recondite source, but which is less generally known in England than in France. Under the Bourbon Restoration, when everybody was sentimental, it became the fashion to imitate André Chénier's elegies. An enraptured public welcomed and wept over "La jeune malade," "La sœur malade," "La jeune fille malade," "La mère mourante," &c. At last an exasperated critic offered a prize for an elegy, to be entitled "L'oncle à la mode de Bretagne en pleine convalescence," which is said to have stopped the torrent. When we come to the maidservant answering a cool letter from her lover, and the negative reply to a missionary, we feel that the Complete Letter-writer would not have blushed at the French critic's test. He would write you without the least difficulty a "Letter to a Scotch Fourth Cousin twice removed in a Fair Way towards Recovery," or a "Conditional Proposal from a Veterinary Surgeon who has good Reason to expect an Outbreak of Pleuro-pneumonia in the Neighbourhood."

The "Gentleman's Letter-writer," which follows naturally, gives the counterparts of these communications, with some slight differences; and the "Lover's Letter-writer" at the end adds several choice specimens. The almost scholastic refinement of the Letter-writer's imagination is indeed shown to greatest advantage here. He not only gives forms of proposal, acceptance, and refusal in vast variety, but graduates them carefully in tone. "From a Lady in reply, Unfavourable"; "From a Lady in reply, More Favourable"; "From a Lady in reply, Favourable"; "From a Gentleman to his Fiancee, Complaining of her Not Writing"; "Another, More Severe"; and so forth. But, as the most particular case is not too minute for him, so the vaguest does not elude his grasp. "From a Gentleman to his Fiancee (General Subjects)," must be admitted to be an almost audacious attempt at preceptorship. Perhaps the table of contents is not the least attractive part of the book. The actual correspondence—except a really interesting and dramatic narrative of a visit to the Highlands, the adaptability of which to general use is rather questionable, unless it is to be done on the well-known *volgus* system of Tom Brown, by prefixing a short introduction and ending with *O genus humanum*—is rather heavy reading. When the Letter-writer says "We have no need to insist on correct grammar," he should have substituted for "need" "right." Throughout the letters "will" and "shall" change places; and once, at least, "to your mother and I" makes its appearance. Nor are we quite certain that the "ridiculous style" of the books which this complete epistoler is to supersede was wisely mentioned. Here is an easy form of invitation from one lady to another:—"Letters, you know, contain at the best only mere morsels of news, compared with the substantial fare which a good long chat affords, and besides, they entail upon one the labour of selecting and arranging what we fancy (in our conceit) are the best bits of our secrets, and this duty I am most selfishly wishful to avoid." Again, "My brother has fixed on your neighbourhood because he thinks it is the prettiest he has yet seen, and his taste, I have reason for saying, is exquisite in topography." Alas! that a Complete Letter-writer should not know that topography means the description, and not the selection, of places. A reference a little further on to "these troublesome English verbs which used to puzzle me so much" may perhaps explain the "I will feel much pleased" which occurs in the same letter. Unfortunately the guide seems to be a blind one in more points of grammar than one, as this third-person note will show. "Mrs. Nelson begs to thank—for her letter, and if she can con-

veniently call to-morrow Mrs. Nelson will be at home." We should have thought that this common, but most illiterate, blunder (the use of the conjunction instead of a full stop and a fresh sentence) was one of the very things which a Complete Letter-writer ought to teach its readers to avoid. Nor is the Letter-writer's ingenuity in the invention of reasons less remarkable than his ingenuity in the discovery of situations requiring a model letter. "I left," says a young woman in search of a situation, "in consequence of the presence of an obnoxious person in an adjoining department." It is to be feared that in real life a reflection involving an insult to the Royal Marine Light Infantry would probably follow the reading of this remarkable allegation. Something similar might also suggest itself when one of the young ladies who have been accused of flirtations explains that "the person had just returned from the West Coast of Africa, where he saw John." It is really wrong to suggest to young ladies means of escape of this unblushing character. The unfortunate prevalence of slang in these latter days gives a very odd look to the abrupt request, "Dear sir, you will oblige me by instructing your agent to call and look at the condition of my upper rooms, with a view to putting them in a state of thorough repair"; though this, it must be admitted, is not the Letter-writer's fault. But what, we should like to know, would any judicious father do who received from his son a complaint about his treatment in school in these words:—"I feel bound, therefore, to write to you on the subject, that you may require the principal to act up to the representations made to you when I was left here"? It is to be hoped that that father would require the principal to act in a very decided fashion. Only two more out of a thousand oddities can we find room for. Will the Letter-writer tell those of his kind in whose case it is not too late where they can find a young lady who, in reply to a proposal, will, truthfully of course, express a hope that her future husband will "reprove her faults gently if she errs"? And will he tell us how he reconciles it to his conscience to give this form of concluding a business letter in French:—"Avec l'espoir d'être favorisé de vos ordres, nous restons, messieurs, rous tout dévoués"?

It must have struck many people that the Complete Letter-writer of these days is slow to comprehend the vast field open to him. Why does he stick to mere correspondence, which, as he himself frankly confesses, is a thing of the past? Nobody, it is true, writes letters, but everybody writes books of travel, novels, minor poems, articles in newspapers. The common form of these things can be given at least as easily as that of a "Letter to a Lady in Painful Circumstances," or the refusal of a missionary's offers of partnership in the attempt to convert Okojumbo and make Ja-Ja a savoury professor. In the travel and novel business there is much room for ingenuity; but the other two open a still wider door to a person of our Letter-writer's imagination. "Ode on a young man who has thrown himself from a Calais steamer after vainly attempting to persuade two newly-married ladies to elope with him, and with whom the sea nymphs fall in love"; "Obituary leader on the death of the fourth best authority in England on grey shirtings," and other things of the kind, admit of remarkably easy reduction to common form. The only fear is that the existing practitioners might combine to waylay the betrayer of their mysteries and make him immortal. However, our present author is welcome to the suggestion on the condition that he clears his mind of confusion between "will" and "shall." Sense and style are too much to expect; but grammar in the days of School Boards might surely be forthcoming.

#### ABERDEENSHIRE LAIRDS.

IT seems to be the very fatality of things which has forced the Aberdeenshire lairds into an unenviable publicity in spite of themselves. They find themselves set in the forefront of the struggle which is to be carried on against the discontented Scottish tenant-farmers, and the speeches in which their order is occasionally denounced are vigorous specimens of scathing invective. For, although the majority of tenant orators preserve a certain measure in the exposition of their trials and their grievances, there are fervid gentlemen whose impassioned indignation defies the control of the chair, and outstrips the sympathies of their fellows. It might be supposed that the unfortunate Aberdeenshire proprietors had been sinners beyond the rest of their privileged caste; that long-smouldering animosities had been at last fanned into flame; or, at all events, that those sturdy North-country agriculturists did their farming under conditions specially adverse. As a matter of fact, anybody who knows anything of the subject must be aware that circumstances are precisely the reverse. The Aberdeenshire proprietors have always borne a high character for liberality and intelligent enterprise; and the proof is to be found in the extraordinary rise of rental that has taken place in the course of a couple of generations. Nor were their farms forced up to fancy rack-rents by an insensate land-hunger such as has been the curse of Ireland. There has been keen and open competition among shrewd men who lived and thrived on their deliberate bargains; while the cordial relations between the lairds and their dependents were notorious. Whatever his faults may be, the North-countryman is no sycophant. It was the custom of the country to have festive gatherings of the tenantry to celebrate an accession, a wedding, or the birth of an heir; when the kindest speeches were vociferously

cheered by men who, like their fathers and grandfathers, had often been born on the estate. Nor can any exceptional pressure of unfavourable circumstances explain the present agitation. On the contrary, Aberdeenshire has been saved from the worst stress of American competition by its stock-raising, as Ayrshire has been saved by its dairy-farming, though the importations of Transatlantic meat and cattle are beginning to make themselves seriously felt; and oats, barley, and bere have been grown, almost to the exclusion of the more speculative wheat. So, without entering into the actual merits of vexed questions, we are led to assume that there may be truth in what the lairds aver—that they have been unfortunate in having among their tenant neighbours certain unruly and ambitious spirits with a natural turn for agitation. And the assumption seems to be confirmed by the undoubted fact that some of the gentlemen who figure most conspicuously on the local platforms have no personal grounds of complaint. They are comparatively rich; they pay their rents punctually; and they would be the last men in the world to admit that their lairds had got the better of them in a carefully considered bargain. It may seem uncharitable to deny their claim to be the disinterested champions of their less lucky neighbours; but it is certain that they have their immediate reward in increased popularity and notoriety. Be that as it may, the lairds have to face a future which is far from reassuring to men who as a rule have been at least living up to their easy means, and whose incomes had of late been agreeably elastic. It is hard to say how far a Government that has passed the Irish Land Act and created the Irish Land Courts may be disposed to go in the way of land legislation in deference to their zealous supporters in the Scotch counties. But in any case, by the inevitable revision of contracts there must soon be a general reduction of rents, and undoubtedly there will be increasing difficulty in finding solvent tenants. The lairds will have to retrench, and retrenchment, which is never pleasant, is especially difficult to a landed proprietor. The very prosperity which the Aberdeenshire men have enjoyed, and the enterprise which has been their pride, will turn against them. They have built handsome mansions with ranges of spacious stabling; they have laid out miles of approaches through their home farms and private grounds; they have indulged their æsthetic tastes in ornamental flower and landscape gardening. They have kept up the Northern traditions of hospitality, have filled their houses with guests through the summer, and overcrowded them in the shooting season. In winter, as in the spring, many of them have gone up to town, and they have all got into the habit of travelling. Their children have been expensively educated, with expectations which it will be almost impossible to gratify. Then they have been saddled as a matter of business with liabilities which have become onerous to discharge, and it has been said on apparently good authority that three-fourths of their properties are heavily burdened. The dowager draws a jointure from the estate, estimated on the expanding rental of thirty years ago. The younger brothers and sisters of the laird were portioned on a similar scale of calculation. And the law courts afforded even to heirs of entail facilities of borrowing of which they freely availed themselves. It was an excellent investment to raise money on heritable security at rates varying from 3½ to 4½ per cent., for which the tenant who borrowed at second hand willingly consented to pay 5 per cent. Now, in many instances, it is to be feared that that apparently judicious outlay represents something like a dead loss. The current interest on the heritable bond is a constant claim, while the tenant is clamouring for a relief from his engagements which must probably in any case be conceded when the farm is relet.

Though establishments will be reduced and expenditure restricted, though possibly some old families may have to remove and throw their hereditary acres on a falling land market, it cannot be said that the lairds are paying the penalty of their imprudence or suffering for the sins of extravagant forefathers. The Aberdeenshire landowners have always been a shrewd, spirited, and careful race of men, and the present generation are simply the victims of untoward circumstances. The change in the aspect of the county in the course of the last sixty years has been as great as that in the gentry's manner of living. Sixty years ago the old habits of conviviality still lingered, and the profuse hospitality was almost as rude as the farming. The landlord lived among his own people and with his nearest neighbours, seldom travelling beyond the county town. If the highways traversed by the mails were kept in excellent repair, the side roads were execrable; so communications even on horseback were precarious at the best, and in winter became almost impracticable. The inconvenient old-fashioned mansions were often packed with jovial parties, who, although sitting down to dinner tolerably early, were apt to keep up their potations to the small hours. We believe that the old race of Aberdeenshire lairds never had such a character for conviviality as their hard-headed brethren in Angus; nevertheless each family event was held to be an excuse for hard drinking, and the carousing never was deeper than at the mirthful ceremony of a funeral. Keeping up the credit of the well-stocked cellar was the chief item of expenditure; otherwise entertaining cost comparatively little. The bills of the wine merchant and grocer were paid in hard cash, though sometimes dairy and farm produce was bartered for the tea and coffee; but the beef and mutton and poultry were supplied from the property. The tenants paid a portion of their rents in "kain" fowls and in carriages—"carriages" meaning the carting of coal, wine-casks, &c. The daughters of old families, when they had settled into confirmed spinsterhood, withdrew into the small country towns; and nothing

shows more the cheapness of living in those times than the ludicrously small incomes on which those ladies contrived to make a respectable appearance. In fact, there was little coin in circulation; no one cared to part with money who could keep it, and those who grew rich grew rich by saving. The landlords were few indeed who dreamed of making advances for improvements to tenants; the land was generally divided into small holdings; the farmers and crofters were poorly housed, and the farming was most primitive. The country, to a stranger, seemed bleak; but it had capabilities that were scarcely suspected by residents. Some of the larger landowners, who were familiar with the South, began to set an example of enterprise; and their undertakings proved so remunerative that they speedily found imitators. The fields were cleared of stones, while dykes or walls of the loose granite refuse were formed everywhere. The arable land encroached on the heather and peat mosses; the thickets of furze and broom were grubbed; and coverts of grouse gave way to the partridges. Ducks and snipe began to disappear likewise as agriculturists awakened to the advantages of draining. The planting of broad stretches of fir wood proceeded apace; and the lairds, following the advice of Dumbiedykes in *The Heart of Midlothian*, were sticking in trees that would be growing while they were sleeping, in land that could hardly repay cultivation. The shelter afforded by the rising plantations was invaluable in districts which were flat more often than hilly, and which were swept by nipping winds from the North Pole.

The result of these various operations was that the county attracted tenants with considerable capital, who continued the work which the lairds had commenced. A welcome was given to these substantial men, and many crofts came to be absorbed in a single large farm. The straw-thatched cottages or huts gave place to commodious steadings, and it became worth while to improve the quality of the cattle when they could be housed in well-ventilated buildings and turned out in well-drained "grass parks," in place of being sent to graze in rush-grown swamps. Grass fields and flourishing herds of cattle are more independent of climate than even the hardy crops of oats and barley. Already the cattle trade had assumed considerable importance when first the improved cargo-steamers, and next the introduction of railways, brought Aberdeen into quick communication with the South. Meanwhile, education had kept pace with agriculture; the parish school teaching had been immensely improved, and many a future farmer received an excellent training at the twin Universities in the city of Aberdeen. But although the tenants thrive, they continued to live frugally; and though their rents were rising, they did well and saved money, in spite of occasional spells of bad seasons, so long as they suffered but slightly from foreign competition. They had security of tenure in the nineteen years' leases; nor did they object to strict regulations as to rotation of cropping, since these regulations were based on the custom of the country. In the last fifteen years or so all that has been changed. Every one knows that a succession of more or less disastrous seasons has coincided with falling prices in cattle as well as in grain. Many of the best farms were undoubtedly too highly rented to stand the severe strain. Men made losses instead of gains, and begun to exhaust their reserves of capital. The local banks, which had given free facilities for borrowing, changed their policy and called in their advances after the fatal collapse of the City of Glasgow Bank. Many persons, moreover, are said to have been dealing recklessly with the artificial manure Companies. So now the laird is often in the dilemma of either giving a defaulter indefinite time and releasing him from rent in the meanwhile, or of forcing him into the Insolvent Court and having another farm thrown upon his embarrassed hands. To do them justice, and even by the admissions made at the meetings of the farmers, the lairds have in most cases consulted at once their feelings and their true interests, and have seldom dealt hardly with deserving men. But the losses of the tenants, which they already have to share, must fall upon them later still more heavily; and they must look to cutting their coats according to the shrunken cloth, even though the new garment may pinch them permanently.

#### DANGERS OF ELECTRIC LIGHTING.

THE late lamentable death of a workman at Hatfield who was killed by coming in contact with an electric light lead has again disturbed the public mind, and has indeed produced a state of feeling which may easily be excited into a panic by the opponents of electric lighting. It is by no means our desire to underestimate the dangers which exist, and which have been publicly demonstrated by more than one death, and by several fires which were by singular good fortune of only small importance. Indeed, to underestimate these risks would be to defeat the object we have in view, which is to point out how all danger is to be guarded against, and the importance of making all lighting and other systems in which large currents of high electro-motive force are conveyed in or near buildings perfectly safe. There has been some talk of getting legislative interference in the matter. We think that as yet this is hardly necessary; but, unless electric engineers take the utmost pains, and use every means for the protection of life and property which science can suggest, popular opinion will most certainly prefer even the inconvenience of putting such matters under official control to allowing the existence of perils which are the more

dreaded because of their being to most people mysterious and incomprehensible. What these perils are we will endeavour shortly to point out, and briefly and generally to explain. First, as to fire. If two leads are used, so that there is a complete metallic circuit, if these come in contact the resistance of the whole system is reduced. This causes the actual current passing to be increased, and with it the heat produced in the whole system, most of which appears at the place of highest resistance—that is to say, at the point of contact; and this heat is often so great as to make the leads or wires hot enough to set fire to any woodwork or other inflammable substance which they may be near. This risk is not so great when only one lead is used, and the earth is employed as part of the circuit, it being very unlikely that the lead will come in contact with the earth. As to danger to life, the effect of a continuous regular current passing through the human body is very slight, being confined to an irritation of the skin at the points of contact with the conductors, and certain effects on the nervous system (which vary with the direction of the current), which effects are only well marked after the current has been passing for some time. At the moments, however, of making contact and breaking contact, if the current be of considerable electro-motive force, a "shock" is felt; if the current be rapidly interrupted, or rapidly and suddenly varied in strength, these shocks are repeated, and then the muscles are paralysed for the time, and considerable disturbance of the nervous system, accompanied by pain, is set up. These effects are more strongly produced when the current is rapidly reversed—a familiar example being the effect produced by the shock of a small induction-coil, when, as is well known, the arms tingle and ache, and it is impossible to leave go of the handles until the action of the instrument is stopped. The same effects are also produced by the common alternating current magneto-electric machines sold by medical instrument makers, which are too often bought and used without medical advice by persons who have heard of the good results of treating certain diseases by electricity, and who proceed, in the confidence of ignorance, to apply to their own case a system of treatment which it is no exaggeration to say is only useful in about one out of five hundred cases.

In the dynamo machines used for electric lighting and the electric transmission of energy, currents of high electro-motive force are usually generated, and the machines are of two types—alternating current machines and direct current machines. Those of the former type are even theoretically highly dangerous to life if there be any chance of the shock being received by a human being, and two accidents are well known to have occurred from their use. In one case a seaman was killed on board of the Russian Imperial yacht *Zevardia* by taking hold of a masthead light, worked on the Jablochkoff system, and bringing his hands in contact with the terminals; and in the other case a musician was killed at an English provincial theatre by laying hold of the leads conveying the current. Danger to life is not the only objection to this class of electric generator. If the leads from such a machine pass close to telegraph wires, the effect of induction is so great as to disturb the action of delicate forms of telegraph instruments, and to render telephones on such wires practically useless; and we fail to see any advantage in this type of machine which counterbalances these defects. The direct current machines have not, until the accident at Hatfield, been found to be dangerous to life, although some severe cases of suffering have arisen from their use, because in all so-called direct current machines the current, even if it be not interrupted, is a varying one. The variations are too rapid to affect the lights, and, for practical purposes, the current may be considered to be constant. Yet these variations are sufficient to give a severe shock, which, as we now see, may under certain conditions cause death. The general vague popular ideas on the subject are quite unfounded in fact, and are due probably to a certain bastard poetic style adopted by certain popular writers, who love to talk of human genius chaining lightning to its car and forcing the thunderbolt of Jove to light a theatre. The terrible and erratic effects of lightning are due, it must be remembered, to something which men of science choose to call electro-motive force—a thing about which they know nothing, except that it is a measurable quantity, of which there is a definite unit, and the effects of which are understood within reasonable limits; and that to produce lightning effects, even on a small scale, as by a large induction coil, an electro-motive force of millions of units—which are called volts—is required, whilst the most powerful dynamo machine in use produces an electro-motive force measurable by hundreds of units only. Within such limits, or even up to many thousands of volts, we know that there is no danger of electricity breaking loose, and we know our conditions of safety. These conditions are that, wherever leads are above ground, they must be covered with some insulating material. Whenever one lead and an earth return are used, the lead should be out of reach, say ten feet from the ground; and wherever two leads are used, they should be at least ten feet apart. If these distances were maintained and the leads securely fastened, there would neither be danger of their coming in contact, nor of any human being being included in the circuit by accident. To produce danger it would be necessary for the insulating material to be destroyed, and for the two leads, or the one lead and the earth, to have come so close together that it would be possible to touch both at the same moment. The danger really is analogous to that of being burnt by touching the main steam-pipe of a factory engine, a danger which is guarded against by

covering such pipes with felt or other bad conductors of heat, and placing them where the workmen are not likely to come up against them by accident. The danger still remains of accident to those whose duty it is to attend to the lamps. To overcome this every lamp should be fitted with an arrangement for "short circuiting," and this should always be used by the attendants before touching the lamp. No locomotive fireman would dream of cleaning out his smoke-box unless he had assured himself that the steam blast of the engine was cut off, and so no attendant on electric lamps ought to touch a lamp unless either the current is stopped or the lamp short-circuited.

The precautions which we suggest are so easy to carry out, and are based upon such well-known principles, that we can only marvel that they are not universally adopted already. Unfortunately electricity is difficult as a study scientifically, whilst sufficient practical acquaintance with its phenomena for commercial purposes is easily acquired; and the result is that, though we have some most able and thoughtful electricians amongst our electric engineers, we have too many who are typical "Practical Men," who are not only ignorant of science, but regard scientific knowledge as not only useless, but actually harmful.

It is to be hoped that sufficient sound information may be put forward in a simple and popular form to prevent the advance of most valuable inventions from being checked by the not unnatural fear excited from time to time by terrible accidents, which are really due, not so much to any exceptional danger attending the use of large electric currents, as to the ignorance or carelessness of those who are responsible for the placing and erecting of lighting and other electric systems.

We can only hope, in conclusion, that the late lamentable accident may influence electric engineers and their foremen, and lead them to consider safety as well as efficiency in making and carrying out their plans.

#### THE WESTMINSTER PLAY.

THE *Adelphi* of Terence is perhaps the best of the four Latin comedies which form the Westminster cycle. It was the last play written by Terence before he embarked on that mysterious voyage to Greece, of which the only thing certainly known is that he never returned from it, and it was brought out at the funeral games of *Æmilius Paulus*, the conqueror of Macedonia, in the year 160 B.C., when the *Hecyra* was produced for the second time. The latter play was a failure, as it had been when first acted at the Megalesian games some years before; but the *Adelphi* at once gained popular favour, and is now very generally regarded as Terence's masterpiece. In the seven years or so which separated the composition of the *Adelphi* from the day when Terence, an obscure alien, read the *Andria* to the veteran dramatist *Oncilius*, the poet had learned much of the art of dramatic construction; and, as an acting play, his last comedy is vastly superior to his first. It is true that the *Adelphi* is not so rich as the *Andria* in those happy sayings which have since become proverbial; but the plot is more ably worked out, and the action proceeds far more briskly in the later of the two plays.

The plot was taken from the Greek not only of *Meander*, but of *Diphilus* and others, and we find from the prologue that the enemies of Terence, who pursued him throughout his career, had accused him of borrowing from the *Commorientes* of *Plautus*. Terence rebuts this accusation by showing that he has only had recourse to the plays of *Diphilus*, from which *Plautus* also had taken his plot; and he calls upon the audience to judge:—

Fortunne factum existimetis an locum  
Reprehensum, qui prætoris negligentia est?

The central characters of the play are, of course, the brothers from whom it derives its title, and the main interest of the plot arises from the contrast between the rough manners and harsh character of the rustic *Demea* and the gentle easy disposition of the town-bred *Micio*. The two sons of *Demea*, one of whom has been adopted and brought up by *Micio*, while the other has remained under the control of his stern and thrifty father, present no such contrast. The only difference between them is that, while *Æschinus* can pursue his rather dissipated courses without check, and is indeed encouraged to make a confidant of his indulgent uncle, *Otesiphon* is driven by fear of his father's anger to conceal his irregularities. Hence complications arise. *Otesiphon* is in love with a slave girl; *Æschinus*, to help his brother, carries her off by violence from her owner, and, sure of his uncle's easy forgiveness, allows it to be supposed that he is himself her lover. This comes to the ears of *Sostrata*, a poor widow, to whose daughter *Æschinus* has engaged himself. She naturally supposes that *Æschinus*, who cannot explain matters for fear of betraying his brother, has deserted her daughter, and she seeks the aid of her kinsman *Hegio*. *Hegio*, meeting *Demea*, who has already heard of the abduction of the slave girl, tells him of this new evil-doing on the part of *Æschinus*, and thus gives him fresh ground of complaint against the foolish indulgence of his brother. Meanwhile, *Micio* has been informed of the whole affair, and at once sets to work to make everything end happily. *Demea*, whose suspicions are aroused by the prolonged absence of *Otesiphon* from home, is cleverly befuddled by the slave *Syrus*; and, by the time that he returns from a wild-goose chase all over Athens, everything is arranged. After

a stormy interview with his brother, *Demea* is persuaded, sorely against his will, to join in the general rejoicing.

Here the play might well have ended. Up to this point all is excellent; the action never stops for a moment, and every line of the dialogue tells. *Demea* has now been sufficiently punished for his excessive severity and stinginess towards his son; and *Micio*, who, though he is easy-going and over-indulgent, has done nothing to make him either hateful or ridiculous, retains the full sympathy of the audience. The poet, too, has shown great command both of humour and of pathos. The opposite characteristics of the two brothers are brought out with the greatest art in their conversations; and it is finely indicated that *Micio*, in spite of his gentleness and amiability, is really the stronger character of the two. There is both wit and humour in the scenes between *Demea* and *Syrus*. The passage in which the slave draws out the old man on his method of education, and on the excellent results brought about by it in the case of *Otesiphon*, is full of delicate irony. The fun of the scene where *Syrus* sends *Demea* to seek his brother at the other end of Athens is of a more obvious kind, but equally good in its way, and it is intensified by the keen delight which *Syrus* takes in his trickery. *Sostrata*'s discovery, as she supposes, of the treachery of *Æschinus* is full of pathos; but the situation is treated with restraint, and the pathos is never overwrought. The scene, too, between *Micio* and *Æschinus*—where the uncle, after amusing himself for a time with his nephew's embarrassment, tells him to bring his bride home—contains sentiment of the best and truest kind. But there is a great falling off in the fifth act. *Demea*, finding that his surly temper and thrifty habits have gained him nothing but the hatred of his family, suddenly turns round, and outdoes even *Micio* in amiability and reckless generosity. Terence himself seems puzzled how to account for this sudden change. It is evidently due to selfish considerations, and not to any real conviction, as is apparent from the lines which end *Demea*'s soliloquy at the beginning of the act:—

Ego quoque a meis me amari et magni pendii postulo;  
Si id sit dando atque obsequendo, non posteriores feram.

Still it is not quite clear whether he is laughing in his sleeve all the time. His chief acts of generosity are done at his brother's expense; and his general amiability is so extravagant that Terence can scarcely have intended *Demea* himself to be unconscious of his own absurdity. This view of the case is confirmed by his answer to *Micio*'s astonished inquiry:—

Micio. Quid istuc? quare tam repente mores mutavit tuos?  
Quod prolebrum? Que istæ subita est largitas? DEMEA. Dicam tibi:  
Ut id ostenderem, quod te isti facilem et festivum putant,  
Id non fieri ex vera vita neque adeo ex æquo et bono,  
Sed ex assentando, indulgendo et largiendo, Micio.  
Nunc adeo si ob eam rem vobis mea vita invisâ, Æschine, est,  
Missa facio: effundite, emite, facite quod vobis lubet.

The moral pointed by these lines is good enough, though decidedly at variance with the rest of the play. But, if Terence meant this to be the lesson conveyed, why did he not make it clearer? Perhaps he did not wish to give *Demea* too decided a victory over *Micio*. But he had already made *Micio* utterly ridiculous by marrying him, against his will, to the elderly widow *Sostrata*; and this imports into the play another element of incongruity. *Micio* with all his good nature is no fool, as is proved by the way in which he gets the better of *Demea* in all their disputes, and it is quite inconsistent with his character to marry just to please his brother and nephew. If Terence wished to show that there are limits beyond which good nature is more folly, he might easily have done so without sacrificing the most pleasing character in the play. *Demea*'s conversion to the ways of mildness might have been made less doubtful than it is, and the widow might then have been married to him instead of to *Micio*. The moral would have been equally good, and the play would not have been spoiled by an unsatisfactory ending. As it is, the feeling of every reader, and still more of every spectator of the play, must be that expressed by *Diderot*:—"Après avoir été pour Micio contre Démée, on finit sans savoir pour qui l'on est."

The acting of the play was particularly good. Mr. Bain, who was the *Davus* last year, remained to take the part of *Syrus*. It would perhaps be unfair to the other actors to say that he carried off the chief honours, for the part of the slave is always the most attractive in Latin comedy, and the one which offers the greatest opportunities to the actor. Mr. Bain certainly made the most of his chances. The celebrated drunken scene was well, and on the whole naturally, acted, though it was not perhaps quite free from exaggeration. Indistinctness of utterance, too, though it may be suited to the circumstances of the case, is not desirable when the language spoken is unfamiliar to a large portion of the audience. However, the scene certainly pleased the spectators; and the last speech of *Syrus*, when the infuriated *Demea* breaks from him and forces his way into the house, was spoken and acted with excellent effect. The words—

Edepol commissatorem haud sane commodum,  
Præsertim Otesiphoni—

could scarcely have been better given. In the amusing scenes between *Syrus* and *Demea*, Mr. Bain was well supported by Mr. Dalb, who gave a vigorous, yet not too vigorous, rendering of the irascible old man. Mr. Waterfield, as *Micio*, acted a difficult and rather thankless part extremely well. The long tedious speech with which the play opens reminds one of the ridicule thrown by *Aristophanes* upon the very similar prologues of *Æschylus*. To deliver it in such a manner as to render it attractive to an audience

would severely try the powers of a practised actor. Mr. Waterfield got through the task very creditably, and his acting in the scene with *Æschinus*, to which we have already referred, was very good indeed. We must not omit to mention the *Sostrata* of Mr. Sampson. The part is a small one, but the effect of the only pathetic scene in the play depends upon the way in which it is acted, and Mr. Sampson showed both power and self-restraint. His make-up and assumption of a woman's voice were excellent.

The Prologue, which is written as usual in Iambic metre, possessed more than ordinary interest on account of the touching reference which it contained to the death of Dean Stanley, and the graceful welcome addressed to his successor. We quote the lines in memory of Dean Stanley, for they are worthy of their subject:—

Hoc tempore unam præter omnes æniam  
Deposuit annus: ille quod discesserit  
Nostræ Decanus unicus Collegio,  
Cunctis amandus, presidium et decus domûs;  
Calamo felici oblivionis e situ  
Præterita sollers suscitare sæcula;  
In pueros quam benignus—Benefactor Scholæ;  
Quam suavis in colloquio, qua facundia  
Ardente! Puro pectore, intacta fide:  
Iniqui impatiens semper, ac veri tenax,  
Vindex per omnia intrepidus causæ bonæ:  
Occidit! an æquum huic invenire sit parem?

The Epilogue, which was scarcely so well constructed as usual, was mainly concerned with the state of things in Ireland; the weather forecast, the condition of the crops, fair-trade, and other topics of the day, were introduced without much connexion, and the characters appeared upon the stage in a rather bewildering manner. The main plot was as follows:—*Nicio*, who is a Sub-Commissioner of the Land Court, comes in, after viewing the farm of *Syrus*, and decides that *Syrus* is for the future to pay less than the "nihil" which has been his rent hitherto. While *Demea*, the landlord, is deriving what comfort he can from the reflection that he has not as yet been "Boycottatus," a large packing-case addressed to him is dragged in. Some alarm is caused by the suggestion that the mysterious package may contain an infernal machine; but *Syrus* at length opens it, and finds that it contains compensation for *Demea*. The "compensation" when unpacked turns out to be a model of Ashburnham House, the appearance of which was perhaps pardonably welcomed with loud applause by the younger portion of the audience.

#### LIMITATION OF BANKING LIABILITY.

IT has for some time been clear that the Scotch unlimited banks would soon be compelled to limit the liability of their shareholders; but as long as there was any doubt upon the subject, the complete success of Sir S. Northcote's Act was not assured. They have now, however, all decided to register under the Act; and by so doing they have given proof that unlimited liability in banking can no longer be maintained. The dislike of the Scotch unlimited banks to the Act was strong, and was based on an objection to take the title "limited" after their names. As is well known, the three older Scotch banks—the Bank of Scotland, the Royal Bank of Scotland, and the British Linen Company—are currently believed to be limited. Some doubt was thrown upon the point by the Secretary of the Treasury in his recent correspondence with the three banks, but the banks themselves contend that their liability is limited, and the contention is admitted by the other Scotch banks. No occasion has ever yet arisen to bring the matter before the Courts, and until there is an adverse decision, it seems reasonable to assume that, as in the instances of the Bank of England and the Bank of Ireland, the Royal Charter incorporating these institutions really does limit their liability. But, although the three banks are thus limited in liability, they are not obliged to take the word "limited" after their names; and the other Scotch banks argued that, if they were to take the word "limited," they would place themselves at a disadvantage in the keen competition which they maintain against the three older banks. The three banks, from the very fact that they are the oldest, have the prestige which in such matters is always an advantage; and the other banks contend that with this prestige—which will be heightened by the general belief that as they are not compelled to write the word "limited" after their names, therefore they are not in fact limited, and a creditor has consequently the whole property of all the shareholders to fall back upon in case of need—these three banks would have an immense advantage over their competitors. We are ourselves inclined to think that in this argument the unlimited Scotch banks gave too little credit to the intelligence of their countrymen. As long as unlimited liability was the rule in banking, it was natural enough that the public should suppose the three chartered Scotch banks also were unlimited, as they did not write the word "limited" after their names, and as they enjoyed all the rights of the other Scotch banks, including the right of note issue. But the great interest which has been excited during the past few years upon this subject has brought the matter to the attention of the general public, and although it is true that public memory is not very long-lived, yet the fact that those banks do not take the word "limited" after their names will excite curiosity. This will keep the facts fresh in the public mind. But, in truth, we do not consider the matter of much practical importance. For we do not doubt that the older banks will be obliged in some form or other to reorganize themselves, and in

so doing to take the word "limited." They some time ago applied to Parliament for Bills to enable them to increase their capital, assigning as the reason that they wished to give greater security to their noteholders and to their creditors generally. When once the three banks have thus admitted that, in their own opinion, the security they offer to the public is not sufficient, it is clear that they must increase that security if they do not wish to suffer in public estimation. And from their correspondence with the Treasury it is equally evident that they will not be favoured with special legislation unless they agree to take the word "limited" like their neighbours. In the meantime all the banks but the three chartered ones have decided to register under Sir S. Northcote's Act, and this week the first meeting of shareholders to carry the decision into effect has been held.

The fact that the strong objection felt by the unlimited Scotch banks has had to give way to the pressure of shareholders is a striking evidence of the necessity there now is that all banks should register as limited. As we have said, although Sir S. Northcote's Act was passed because of the failure of a Scotch bank and the hardships thereby inflicted upon the shareholders, the Scotch unlimited banks have held out until now against availing themselves of the Act. But the pressure, direct and indirect, of their shareholders has become too strong for the directors and managers. The direct pressure was brought upon them, no doubt, by the representations and remonstrances of shareholders, and perhaps stronger still was the indirect pressure caused by the action of shareholders selling their shares. The best proof, indeed, of the feeling of the public in regard to liability is afforded by the fact that the shares of the unlimited Scotch banks immediately rose on the announcement that they had decided to register as limited. At the present time, which is highly favourable to banking business, it is natural that the shares of well-managed banks should be in great demand, and therefore should stand at good prices in the stock market. But so long as the unlimited Scotch banks refused to avail themselves of Sir S. Northcote's Act, the public did not invest largely in their shares. The instant, however, it was announced that they were about to register, purchases were made so largely that the prices instantly rose. The action, no doubt, of the three older banks in applying to Parliament for power to increase their capital also strongly influenced the unlimited banks. Jealousy of these older banks prevented the unlimited banks from registering, and yet here were the three very banks of which they were jealous acknowledging that their present capitals are insufficient and that they require greater powers. For the moment they have withdrawn their Bills and profess an intention not to go on with the matter, declaring indeed that, as they are already limited, they are not able to avail themselves of Sir S. Northcote's Act. But it is clear, as we have already said, that when once the three older banks admit their capital to be insufficient, they must submit to whatever conditions Parliament likes to lay down in order to increase their capital. Practically, then, the whole of the Scotch banks are limited. The unlimited banks are about to register, and the three older banks, whether limited or not, as they themselves contend that they are, will soon be obliged to take steps which will put the matter beyond doubt. In Ireland also several of the banks have become limited. The Bank of Ireland, like the Bank of England, and like the three Scotch banks of which we have been speaking, was incorporated by Royal Charter, and is understood to be limited in liability. The Royal Bank of Ireland registered a year ago; the National Bank has decided to register, and the Munster Bank is already limited. Thus, of the nine Irish banks, four are limited, and others are understood to be about to avail themselves of the Act. In England, also, the great majority of the banks have registered. In London, two of the greatest banks—the Joint Stock and the Union of London—are still unlimited; but the London and Westminster, the London and County, and the National Provincial Bank have become limited, and all the smaller banks have also registered under the Act. Throughout the country, too, the great majority of the banks have now become limited. In fact, out of 150 banks in the United Kingdom, only 31 are now unlimited; and of these 31 it is understood that several have already decided to register under the Act, or have the question under consideration.

The success of Sir S. Northcote's Act has thus been very remarkable. When it was first introduced it was severely criticized, and not a few objectors boldly predicted that it would utterly fail, as the banks would refuse to register under it. It is, however, very little more than two years since it passed, and yet, as we have just seen, whereas the great majority of the banks were unlimited at the time it passed, only one in five is unlimited now. Moreover, the banks that are still unlimited are for the most part, with two important exceptions, small concerns. The whole of the Scotch banks, as we have seen, are now limited; three out of the five great London banks are limited; all smaller banks in London are limited; and, with the exception of Liverpool, most of the banks of the great centres of trade and industry throughout England are limited, more particularly the banks of Birmingham and Manchester, and indeed of Lancashire and Yorkshire generally. The most signal exceptions are the London Joint Stock and the Union Bank of London. These two banks, however, are not opposed to the principle of limited liability. On the contrary, the chairmen of both have declared at public meetings that they approve of the principle, and object only to the special Act. One of them hoped Parliament would reconsider the question, and would amend the Act, and when this was done, he and his

brother directors would be prepared to advise the shareholders to limit their liability. The second bank is understood to be waiting only upon the first. It is, indeed, believed that it would have availed itself of the Act without delay, but that it feared to suffer from the competition of its neighbour. But it must be evident now to these two great banks that the chance of an amendment of Sir S. Northcote's Act is infinitesimally small. As long as the Scotch banks refused to avail themselves of the Act, the influence of the Scotch members might be expected to be used in favour of an amendment; but now that the Scotch banks have decided to register, that influence is taken away. The influence, in fact, of all the great banks which have become limited will probably be used to prevent a further alteration of the law. Having taken the irrevocable step, they must all desire that the whole of the banks throughout the United Kingdom should conform to it, and that there should be as little further alteration as possible. This being so, it can hardly be doubted that these two great banks will be compelled to follow the example of their neighbours and competitors. From a public point of view there can, we think, be little question that it is desirable that all the banks should register. It is now well known that the management of the City of Glasgow Bank was suspected for several years; that many bank managers refused to take its paper; and that, in fact, there were whispers that it was in difficulties, and must sooner or later end badly. But it was able to go on to the length it did because people who took its acceptances knew that, in case of the failure of the bank, they would be able to come down upon the shareholders and recover to the last farthing. When limited liability becomes universal, the discounters of bills will not have this inducement to deal in worthless paper. They will be obliged to look more closely into the management of the several concerns with which they deal, and when they hear of bad management, or see the paper of a bank floating about in greater quantities than it ought to do, they will be compelled by regard for their own safety either to refuse to take the paper, or to assure themselves that they are safe in discounting it. Thus the limitation of liability will compel greater care in two ways. Bank managers will feel that they have not an inexhaustible fund to fall back upon; that, if they lose a certain definite capital, they will be obliged to wind up quickly; and, on the other hand, those who deal with the banks will feel that the security upon which they have to depend is limited, and that they must exercise prudence and caution in their transactions.

#### THEATRICAL MATTERS.

A CONTROVERSY which is not without interest has been lately carried on in the pages of *Le Figaro* between M. Sardou and M. Mario Uchard, who contends that M. Sardou's latest play, *Odette*, is in its main features identical with his own well-known play, *La Fiammina*. M. Uchard began a long letter to *Le Figaro* by pointing out that the discussion was "toute de camaraderie," insisting upon the *franche sympathie* that he feels for M. Sardou, and asserting his conviction that when the disputed question is settled, which it does not seem very likely to be, "nous nous donnerons une bonne poignée de main." He then set forth a letter to M. Sardou, in which, after a suitably courteous preamble, he gave the following

ARGUMENTUM OF *La Fiammina* OR OF *Odette* (ad libitum).

The Count de Clermont is separated from his wife. He has kept or Daniel Lambert with him a child that he has brought up in the belief that its mother is dead. Five years have passed since the separation, when husband and wife meet at Paris just when Daniel hopes to arrange a marriage for his daughter with the son of his friend Mme. de Méryan. But it is necessary to reveal his situation, and the conduct of the mother is an obstacle. If your wife had stayed in Italy under another name than yours, writes Mme. de Méryan, I should have been glad to consent to the proposed marriage; but she has come back to Paris and assumed a doubtful position, which makes the marriage impossible. Tout est rompu.—Désespoir des amants... Quand, par un effet de la grâce, la mère coupable, en retrouvant son enfant, ressent tout à coup un élan de l'amour maternel mal éteint dans son cœur... Apprenant qu'elle est un obstacle au bonheur de sa fille, elle se dévoue, et, pour expier sa faute, elle disparaît en quittant le théâtre, le monde, ou bien se jette à l'eau.

M. Uchard, after this, went on to dwell upon certain differences between his own method and M. Sardou's, and upon certain points of likeness and of unlikeness between the two pieces; and delivered himself thus in the last paragraph of his letter:—"La pièce est-elle de vous? Est-elle de moi? Ou sommes-nous simplement deux collaborateurs? Je crois qu'il faut, en tous cas, régler enfin cette fameuse question de fait et de droit.—Où commence la propriété d'une idée ou d'un œuvre, où finit-elle?..." This is, indeed, a wide question, and it is to be feared that not much light has been thrown upon it by the correspondence between M. Mario Uchard and M. Sardou. M. Sardou's first answer is not quoted; but, as M. Uchard observes, its tenour is evident enough from the response which it called forth. "At the première,"

M. Uchard replied to it, "every one exclaimed, this is *La Fiammina* over again. Certainly the situation of a separated husband and wife is common property; but does it follow that, choosing this theme, you were bound to follow step by step my method of working it out?..." Let us discuss the matter together, and prepare together a statement of the case for the *Commission des auteurs et compositeurs dramatiques*." This, with a good deal of matter touching the "conveying" of French authors' ideas by English playwrights, and the necessity for hawks not to pick out hawks' éen, was the gist of M. Uchard's manifesto. M. Sardou replied to it, curtly enough, that M. Uchard had not availed himself of an invitation of three weeks' standing to state his case in person to the Committee; that, as *La Fiammina* was in print, people could compare the two pieces (of course by going to see M. Sardou's, which is, or was then, not in print), and that the fuss made would probably sell a few copies of *La Fiammina*—"et, entre nous, je crois bien que c'est tout ce que souhaite mon ami Mario." In a third published letter M. Uchard declared that he had no interest in the sale of *La Fiammina*, spoke of a *haute question littéraire* being reduced to a *question de boutique* by *notre ami Sardou*, and withdrew his request for a friendly arbitration, "car, dans notre nouveau cas tout spécial, ces sortes d'affaires se portent devant les tribunaux civils et compétents." There, for the present, rests this new chapter of the quarrels of authors, into which the names of two eminent French critics were brought by M. Uchard to support his view, the two being M. Vitu and M. Sureau, from whom an English writer—we cannot say critic—has lately borrowed his worst faults, without being able to take over at the same time any of his merits.

Perhaps the greatest of M. Sardou's faults is a tendency to personalities which is not peculiar to him amongst French critics, but from which English criticism has as a rule been happily free. It is safe to say that all French criticism has been distanced in this respect by an article which appeared last week in the *Times*. The occasion of that article being written was a performance at the Haymarket Theatre of *She Stoops to Conquer*, in which, with one exception, the parts were taken by actors of mark. The one exception—the part of Miss Hardcastle, filled by Mrs. Langtry—was no doubt an important one. Mrs. Langtry appeared on this occasion as an amateur, and we have no intention of discussing her capabilities as an actress until the intention attributed to her of appearing as a professional actress is carried out. It does, however, seem desirable to call attention to the nature of the article referred to—an article which, we hasten to say, it is safe to conclude from internal evidence was not written by the regular dramatic critic of the *Times*. This remarkable production of modern journalism, which occupied a prominent place in the columns of "the leading journal," began by telling again, in a singularly unamusing fashion, the old, old story of the first production of *She Stoops to Conquer*, and went on into such a burst of mawkish and garrulous servility as is happily seldom seen in the pages of a paper of reputation. In the inception of what was supposed to be the critical part of the article the functions of critic and reporter were curiously confounded. "The house," we learnt, "overflowed with rank, fashion, and celebrity," as if this had anything whatever to do with the merits or demerits of the performance. The rank, fashion, and celebrity were there with a praiseworthy purpose, since "the proceeds of the performance were to go in aid of the funds of an excellent institution," although the writer had informed us in a previous sentence that the audience was drawn to the theatre by sheer curiosity. "Even those who came only to look," the writer continued, "will admit that they had their money's worth." Comment would be wasted upon the taste which allowed such stuff as this to be written and published as part of what purported to be a criticism on the performance of Miss Hardcastle by a lady who, it was understood, was anxious to put her powers of acting to a serious test. It was no doubt to be expected that many spectators would go to the Haymarket Theatre on this occasion led merely by a motive of curiosity, but it was hardly to be expected that the *Times* should write of this curiosity and of its gratification in the terms just quoted. What followed must be allowed to speak entirely for itself. No words of ours could add anything to the condemnation which every line of it carries in and to itself. "Exquisite purity of complexion (remarkable in this lady) unaided by art is apt to become paleness on the stage. The brightest of eyes are not seen to advantage across the footlights, but the finely-shaped head, the classic profile, the winning expression of the features, the fascinating smile, the musical laugh, the grace of the figure—a full-flowing roundness inclining to length—these are gifts which the public in a theatre can appreciate as well as the privileged admirers in a drawing-room, and the enthusiastic applause which greeted Mrs. Langtry on her entrance must be regarded as the willing eager homage to the far-famed beauty as well as a cordial welcome to the *débütante*." But even this was not enough. The writer must needs further show the versatility of his accomplishments by exhibiting his competence to compose airy descriptions for the *Magasin des modes*. Miss Hardcastle, he informed us, appeared in "three dresses. Her first dress was a pink and yellow brocade, cut low. Her second, a sprigged muslin, and a hat with orange ribbons. Her third, a grey dress, like a French waiting-maid's, with white muslin cap and apron. All were voted becoming, the third *modest of all*." Then came in an attempt at a scrap of critical writing,

in which it was noted, as it seemed, with surprise, that "the merriment" excited by Goldsmith's play "was kept up continuously to the end, unchecked by the reflection that many of the situations were more farcical than comic"; and then followed a dismissal, in a few lines, of the claims to consideration of the players who had appeared in *She Stoops to Conquer*, relieved by what was probably meant for a graceful compliment to an actress who took a comparatively minor part. It is happily not often that English journalism descends to such depths as have been reached in the article upon which we have commented; and it is for that very reason impossible to pass unnoticed the publication in such a paper as the *Times* of such intolerable and offensive rubbish.

## REVIEWS.

### DEANE'S BOOK OF WISDOM.\*

WE have no acquaintance with Mr. Deane that is not derived from sources open to all; but he is evidently one of a class of English clergymen who are becoming fewer every year while yet their services are more needed now than ever—men by whom the leisure of a small country parish is regarded as at once an opportunity and an incentive for literary labour, especially of that kind which is concerned with the exact study of Holy Scripture. Our bishops have long since had to lock up their libraries, and to become the mere slaves of semi-secular business. One very learned prelate is said to have declared that by the time he had lived ten years longer he should have grown to be the most ignorant clergyman in his great diocese; and the claims of a large and populous parish are hardly less exacting and continuous than his. In the days when flower shows and archery clubs and lawn-tennis parties were not as yet, the Church found in her rural parsonages diligent and patient scholars, who devoted some portion of each day to wholesome or holy books, because they rightly judged that "the priest's lips should keep knowledge," and had not yet come to think that theology, the queen of sciences, could be attained to by instinct or intuition. We gather from the tone and spirit of this volume that Mr. Deane belongs to this elder race, and we congratulate him heartily on the pleasure his investigations must have given him in their prosecution, as well as on their happy and fruitful results. Upon no branch of divine learning could his toil have been better bestowed than on editing the *Book of Wisdom*, by far the most important and suggestive of all the treatises which compose that medley of works, varying as widely as possible in their merit and value, called by us The Apocrypha.

Mr. Deane tells us that his attention was turned to this book many years ago, when there existed no Commentary in the English language that treated fully of it, save that of Arnald (d. 1756), in continuation of Patrick and Lowth on the Old Testament; and Arnald, with abundance of erudition and diligence, is "copious indeed, but cumbersome, and often speculative and uncritical." The field, therefore, was open before Mr. Deane; and he has occupied it so well that he is in no danger of being dislodged from ground he has fairly made his own. His prolegomena are very elaborate, and should be read with especial care. "Viewing the *Book of Wisdom* as an important product of Jewish Alexandrine thought, it seemed desirable to offer a brief sketch of the course taken by Greek philosophy in discussing the momentous questions with which it attempted to cope" (Preface, p. 6). Hence, in a section of twenty-two quarto pages, our author, on this subject taking Mr. Lewes for his guide, examines in a summary, but by no means superficial, manner, the physical theories of teachers who preceded Socrates, as Thales, Anaximander, Pythagoras, and the rest; next in order, the practical and purely ethical tenets of Socrates himself, and the speculations of Plato, with whom "universal propositions, abstract terms, were the materials upon which he worked, while in his search for truth he was severely logical," so that his conclusions, being drawn from different premises, would often be inconsistent with each other. From Aristotle, "a less devoutly religious man than Plato, one who seems scarcely to have believed in a personal God," after passing notices of the rival sects of Epicurus and of Zeno, the New Academy is reached, each of these later schools being recognized as in its way a kind of *Preparatio Evangelica*:—

They had all spiritualized to some extent the popular mode of regarding religion, they had restored a certain unity in the conception of the Divine essence, and had given man hopes of redemption from the blind power of nature, and an elevation to a secure and higher life. But here they stopped. They offered these as mere speculative opinions. The best of philosophies had yet to learn that humility which a better religion teaches; and till this was received and acquiesced in, men might argue and criticize and theorize, but they would never arrive at the truth.

It was at Alexandria, that mighty colluvies of Eastern and Western civilization, that speculative philosophy first came in contact with revelation. Mr. Deane had already noted a sharp distinction between the two. "Theology has to deal with faith, philosophy with research." They may both flourish side by side,

\* ΣΟΦΙΑ ΣΑΔΩΜΩΝ. *The Book of Wisdom; the Greek Text, the Latin Vulgate, and the Authorized English Version.* With an Introduction, Critical Apparatus, and a Commentary by William J. Deane, M.A., Oriel College, Oxford, Rector of Ashen, Essex. Oxford: at the Clarendon Press. 1882.

the one throwing friendly light over the dark places of the other, as in the writings of our own Cudworth and More, and the Cambridge metaphysical divines of the seventeenth century; but always on the condition that, where their respective provinces are found to overlap, philosophy must yield place to her nobler sister. This fundamental principle was naturally apprehended only by slow degrees, especially among Jewish thinkers like Philo, whose admiration for the results of Greek philosophical research was at least as great as his reverence for the religious faith of his own people, or for the national ritual to which in his distant home he was a comparative stranger. The writer of this *Book of Wisdom*, who can never have been identified with Philo by any one that had more than a very superficial acquaintance with the tone and spirit of their respective works, could hardly have composed it elsewhere than in Alexandria, and that probably a full century and a half before the age of Philo. On the one hand, he is penetrated with a deep knowledge as well of the facts as of the style of the Old Testament; on the other hand, "a Palestinian Hebrew . . . would scarcely have possessed so thorough a command of the Greek language as the author displays." The grounds for fixing a more exact date for this composition must be confessed to be somewhat precarious. It contains no trace of distinctively Christian doctrine, and is itself plainly referred to several times over in the New Testament (e.g. ch. ii. 22 in Matt. xiii. 11; ch. v. 18-20 in Eph. vi. 13-17; ch. vii. 26 in Heb. i. 3; ch. xv. 7 in Rom. ix. 21); so that it was in existence and even in wide repute at the time of the first preaching of the Gospel; while its constant use of the Septuagint version, where that version differs from the Hebrew, forbids our assigning it to a higher period than B.C. 200, about which time that famous translation was brought to a completion. Mr. Deane cites his test examples of divergence from the Hebrew in favour of the Greek from the prophecy of Isaiah, which is one of the latest and least esteemed portions of the Septuagint, comparing ch. ii. 12 with Isaiah iii. 10, and ch. xv. 10 with Isaiah xlv. 20. Between these extreme limits of B.C. 200 and the Christian era we have not much to guide us. There are several notices scattered up and down this book of seasons of trouble and persecution (e.g. ch. iii. 1, 4, 5; v. 1, &c.); yet the only persecutions visited specially on Egyptian Jews, as such, seem to have taken place in the reigns of Ptolemy Philopator (B.C. 221-204), as related in the Third Book of the Maccabees, and of Ptolemy VII., or Physcon, about B.C. 145 (Josephus, *Antiq.* ii. 5). It is to this last calamity that allusion seems chiefly to be made, so that the book may be as early as the second century B.C. Certain orthodox divines who lived in the dim twilight of biblical study in England have taken the trouble to prove that *Wisdom* could not have been written by Solomon, to whom it is ascribed in the title of nearly all our manuscripts, and whose character is no doubt assumed throughout. We should have thought it plain to the meanest capacity that the assumption is a transparent literary fiction, never intended to deceive, and seriously deceiving no one. The writer, whosoever he may have been, is by far the most spiritually-minded of uninspired writers before Christ came. The companion book of Ecclesiasticus appears cold and worldly in comparison. Hence the veneration accorded to him by the best theologians of every age, from Clement of Rome (Ep. i. 27) to Isaac Barrow, who, fresh from the East and the study of St. Chrysostom, after citing passages from both, thus concludes:—"These are the words of wise Solomon, in the *Book of Wisdom* and in the Proverbs."

The body of this edition abundantly answers to the fair promise of the Prolegomena. Three columns on each page contain in parallel lines the Greek text in the middle, the Latin version on the left side of the page, the Authorized English translation on the right, the verse notation in each case being banished to the margin. The Latin is of the oldest form, untouched by Jerome, so that Sabatier in his great Latin Bible has no other continuous translation to use in this book or in Ecclesiasticus. The Greek is arranged in parallel lines, after the manner of Hebrew poetry, a practice Mr. Deane has borrowed from O. T. Fritzsche (1877), much to our regret. Their model is the Codex Alexandrinus as edited by Baber, but they are sometimes obliged to desert their model (e.g. ch. xviii. 21, 22), while in other places the result is as bad as can be (e.g. ch. vii. 22, 23). The fact is that, while Ecclesiasticus lends itself easily to such an arrangement, *Wisdom* does not. After the first few chapters, where the style is more simple than in the later ones, the language is that of rhetorical prose rather than of poetry. *Græcæ eloquentiæ redolet* is Jerome's fair comment; and of Bishop Lowth's epithets, *grandiloquus*, *colturnatus*, *tumidus*, we respectfully demur to the third. But the book is not verse, and should not be printed as such. Our editor has taken much pains in revising the Greek text by means of the three great uncial copies (A. B.) which fortunately are all complete throughout this book, adopting Fritzsche's collations with a wholesome knowledge of their sad lack of accuracy. He adds to these the celebrated Paris palimpsest fragment (C) edited by Tischendorf, which contains less than half the matter (191 verses out of 436); an uncial manuscript of a later date, imperfectly known (23), and ten cursive copies whose readings are all supplied by Parsons in Dean Holmes's Septuagint, one of them (248) being, in the Apocrypha, the parent of the Complutensian Polyglott. He annexes also notices of the readings of Thilo's nine manuscripts (1825). It is highly inconvenient that Mr. Deane, like Fritzsche, chooses for the capital authorities a notation peculiar to himself, instead of adopting that of his predecessors in this department of criticism. In forming his text he displays both judgment and

skill, calling to his aid as well the ancient but paraphrastic Syriac and Arabic versions contained in Walton's Polyglott as an Armenian translation published in 1827, regarded by Canon Westcott as of great value, and characterized by our author as "so close to the original that it is easy to see what reading it has followed." The groundwork of the text, we are informed, is the Vatican manuscript (B), as edited by Vercellone and Cozza, but still left, and we fear likely to be left, destitute of the necessary critical notes. To B the late uncial (23) bears much resemblance, and Mr. Deane's textual decisions seem rarely at fault. He has none of the rashness which prompts Fritzsche, and that, too, in cases presenting no great difficulty, to resort to mere conjecture, but abides manfully by his authorities, and in his notes tries to make the best of them. Thus, in c. xviii. 22 ἐνίκησε τὸν ὄχλον follows immediately upon a somewhat ornate description of "the blameless man" Aaron standing between the living and the dead (Num. xvi. 47, 48). What may ὄχλον here mean? All manuscripts and versions read the word (*turban*, however, in the Vulgate), except that two cursive copies (157, 248), dragging after them the Complutensian edition and English Authorized, borrow τὸν ἀποθνήσκοντα "the destroyer" from ver. 25. Fritzsche tamely takes into his text Hausermeister's guess (1828) χάλον. Mr. Deane, we are sure, hits upon the true sense, "He overcame the commotion, the trouble," i.e. the plague, and the sinfulness that caused it; a meaning, we may add, familiar enough in the phrase ὄχλον παρέχειν. Before leaving the subject of the Greek text let us gently complain, once for all, of numerous typographical monstrosities, such as seldom issue from the Clarendon Press. The following specimens will suffice: δῆσμων [ἐνεδρεύσμων], p. 31; αἰθερικός and περιόμυθα, p. 38; σκίας, ch. ii. 5; αἰας, ch. xii. 3; ὄργης, ch. xviii. 25.

It only remains for us to say a few words respecting the Authorized English Version, which is quite unworthy to occupy its place in Mr. Deane's third column, abreast of the Greek. The second Cambridge Company, to which the Apocrypha was committed in King James's revision, did its part hurriedly, and at times with almost shameful negligence. Another Committee, now sitting at Cambridge, and composed of men eminently fitted for the task, will beyond question give a very different account of this Book of Wisdom. Arnald had long since spoken of the demerits of our present version in terms not a whit too strong:—

The English translation of the Apocryphal books, which the Church now uses, is that which was made by the command of King James I.; but, though seven very considerable persons were employed in the work, yet it is surprising to observe in how many places it is faulty and imperfect. In that of the Book of Wisdom the language is not only bad, but the sense often obscure and intricate; and, though some allowances may be made on account of the faultiness of the text, which might in particular passages occasion the obscurity of our version, yet often, where the original is pure, clear, and intelligible, the translators have not only fallen short of the force and beauty of it, but have unaccountably mistaken the sense; and where the Greek happens to be equivocal, and will admit of different meanings, have frequently taken the worst and most foreign to the context. The translation of the first part is much the best executed; but the three last (*sic*) chapters betray great negligence, and seem to come from a hasty, if not almost said an unskilful, hand.—Preface.

Arnald hardly seems to know that the worst errors of King James's Apocrypha are survivals from the Bishops' (1572) and even from Coverdale's (1535) Bibles, which have been left untouched in places where almost any change would have been for the better. In regard to the text, it needed a keener critical instinct than John Bois (d. 1643) and his colleagues were gifted with to discern the excellence of that represented in the Roman Septuagint of 1586, grounded, as we now know, on the great Codex Vaticanus. Yet they follow it, after the Aldine edition (1518), in the margin of ch. xv. 5 (ὁρεῖται for ὁρεῖται), and in several other places; and the Roman edition (not on this occasion in agreement with the Vatican copy) in ch. xiv. 25 (πάντας for πάντα). Elsewhere they adhere pretty closely to the Complutensian (1517) and its prototype (248), a cursive manuscript of no great age. Respecting the Authorized text we have but one word more to say. If Mr. Deane decided to reprint it, he should have taken care to resort to the Bibles of 1611 in preference to modern editions, at least where the latter are obviously wrong. Such a case is ch. iii. 14, where the mark of reference should precede "in" (as it does in the earliest issue of 1611), not follow it. In ch. x. 10 "travails" (μύχθους) should surely be read with the Bibles of 1611, 1613, not "travels," as in 1612 and later books; compare ch. vi. 14. So in ch. xvi. 18 we would restore "sometimes" (ποτέ); in ch. xviii. 9, "alike" of 1611 is clearer than "like" of 1629; and why (with 1638) interpolate "and" before "another"? The marginal *tyrant*, ch. xiv. 16, is apparently a misprint; but in ver. 21, marg., "That is" from Junius should be inserted rather than "Or" of 1612. Mr. Deane would think us unreasonable if we tried to recall "unperfect," ch. iv. 5; "unproperly," ch. v. 16, marg., "unconspicuous," ch. xii. 1; but "brickle" (ch. xv. 13), not "brittle," held its own up to 1762.

The new translation which Mr. Deane lacked resolution to attempt was essayed by two writers in 1880, after his text (not his notes) had probably been printed off. That executed by Dr. Bispell, of Edinburgh, we have not seen, but from the specimens cited by our author, we should judge that our loss has not been great. Canon W. R. Churton's edition, undertaken for the Society for Promoting Christian Knowledge, Mr. Deane was permitted to use before publication, and it is sure to be worth much if sufficient time and pains have been spent upon it. Mr. Deane's Commentary is very full and scholarly, seldom missing any

point, whether of criticism, grammar, or interpretation, which needs to be elucidated. In illustrating the tough metaphor in ch. iv. 3, he might as well have glanced at the strange occasion on which one Dr. Shaw took it for his text at St. Paul's; but it is rare enough to find him pass over anything that is really to his purpose. The English Church may well be proud of such a work as this, proceeding as it does from a private beneficed clergyman; and we expect to meet Mr. Deane ere long in the same path of study—perhaps in a new and much-needed edition of the Book of Ecclesiasticus.

#### EVANS'S LEICESTERSHIRE WORDS.\*

WE are very far from questioning the value of the publications of the English Dialect Society, or from wishing to depreciate the merits of this volume on Leicestershire words and sayings. We can very readily believe that Mr. Evans has added much important matter to the collection as it was originally published by his father in 1848; but we are by no means sure that the chief improvement is to be found in the mere number of entries which have enlarged the list from a little more than twelve hundred to more than three thousand. Mr. Evans admits that many of the words now included in the vocabulary were deliberately rejected by his father as belonging to the English language rather than to the Leicestershire dialect. The dialect which for convenience sake may be called that of Leicestershire is not, indeed, to be judged in the same way with the dialects of the extreme North and South; but even thus it is not easy to catch the principle which has guided Mr. Evans in his classification. It is impossible, he asserts, to define a scientific frontier between standard and provincial English; and this is indisputably true. But he has felt himself justified, he adds, in annexing, as the rightful property of his native county, "every word and idiom that came in his way to which a fair title could be made out, although a number of other dialects might have an equal right to advance the same claim."

This sentence, plain though it seems to be, scarcely carries its meaning with it. No doubt Mr. Evans has met with every word given in his list; but we are not told whether he restricts himself to words which have been obtained by himself or by others from the actual talk of the people, or whether his limits include words found in manuscripts or in books, whether he restricts himself to the writings of Leicestershire men, and whether he draws any distinction between what they may have written as Leicestershire men and what they may have penned as bred or educated in other parts of the country. A large license must certainly be allowed to those who compile such lists as the present one; but when a given word is used in every part of England, when there is, so far as we may see, no difference of meaning attached to it in Leicestershire, and when there is no reason for supposing that the word was first obtained from Leicestershire, and then spread over the other counties, it is not easy to understand why this word should be included in the Glossary. If it illustrates any notion or saying or superstition in any way peculiar to the county, it might fairly be placed in the list of proverbs and phrases which Mr. Evans gives at the end of his volume; but it can scarcely be taken as a reason for regarding the word as in any sense the peculiar property of the county. We may take the word *planet*. In the Glossary we have under this heading the following entry:—"To rain by planets," said of rain that comes down partially, wetting one field and leaving another close adjoining quite dry. "But why by planets, my friend?" asked I. "Why, don't you know?" said my informant, "it's all along of the planets." If this explanation be peculiar to Leicestershire, it should go under the head of phrases or sayings, not in the list of words; and accordingly in the list of "Proverbs, rhymes, &c." we have the entry "It rains by planets," with a quotation from Italy, accounting for the phrase on two different grounds. Why are the two entries needed? There is no change in the meaning attached to the word planets, the very phrase implying that the speaker regards them as wandering stars. All that is peculiar is the idea that they cause partial showers. We might fairly say that the word planet ought not to be given in the Glossary of any English or Teutonic dialect, and that it must be inserted in English dictionaries only because a dictionary aims at giving the whole store of words used by a people, whether these words be their own or be mere borrowings from others. We may not be able to spare the word "planets," but as it is not a Leicestershire word, so neither is it an English word.

Still less are we able to see why the Glossary should contain the entry "Tyburn-tippet," of which we are told merely that it means a hangman's halter. Mr. Evans adds to this explanation a quotation from one of Latimer's sermons. "The Bishop of Rome sent him a Cardinal's hat. He should have had a Tyburn-tippet, a halfpenny-halter, and all such proud prelacies." Are we to suppose that Latimer's knowledge of Tyburn-tippets was due to the place of his birth or of his early schooling? Is there any reason for supposing that the phrase would have been by itself intelligible to the common folk of Leicestershire? Latimer in his sermon interprets the phrase by the words "a halfpenny-halter"; but, if the explanation was needed, in what sense can the word be regarded as peculiar to the county? We fail to see any stronger

\* *Leicestershire Words, Phrases, and Proverbs*. Collected by the late Arthur Benson Evans, D.D.: Edited, with Additions and an Introduction, by Sebastian Evans, M.A., LL.D., London: Published for the English Dialect Society. Trübner & Co. 1881.

reason for the insertion of *Bogey*, which is said to mean "an apparition, ghost, diabolic spectre, Old Bogey being the prince of darkness himself." Here, again, we have a word which belongs neither to Leicestershire nor to England; but the meaning attached to it in Leicestershire precisely agrees with the meaning attached to it elsewhere; and if the dark unused coal-cellar under the schoolroom at Bosworth was known as the bogey-hole, we are at a loss to know what we get from this fact when bogey-holes are to be found perhaps in every parish in the kingdom. Something may be said for the insertion of "build" in the sense of frame or form ("Ah niver see a sooch a build"), although the Galloway tailor in Scott's *Guy Rannering* speaks of the out-of-the-way build of Dominie Sampson; but in the entry "Apple-turnover" we fail to see any difference in the Leicestershire usage either as to the word or the thing from the usage of other parts of England. The case is altered when, under the heading "April fool," we find that in Leicestershire talk a man may be made an April fool in any month of the year; but even this peculiarity, which would call for notice in the roll of proverbs or phrases, scarcely justifies the appearance of the word in the Glossary. The same remark applies to the entry "Beetle," under which we have simply two quotations from Latimer and Hall, giving the phrase "blind as a beetle." No doubt the phrase may have been used in Leicestershire for centuries, as it may have been used elsewhere; but if this is to be a reason for inserting it in Glossaries of all the dialects of England, we can but say that of the making of such books there will be either no end or a very distant one.

But we need scarcely say that to a vast number of entries in the Glossary these remarks do not apply, and that many of them are in a high degree interesting and valuable. There is good reason for giving the word "cleverthrough" in the sense of right or straight through, on the strength of a sentence from Macaulay's "Antiquities of Claybrook"—"I shall next ways go clever through Ullsthorpe." Macaulay speaks of the expression as being in common use. Mr. Evans remarks that he has never heard it himself or knows anybody who has. "If," he adds, "the theory of a printer's blunder were admissible in the case of so carefully edited a work, I should have concluded that the author wrote 'clean through.'" If, again, we take the expression "finger-pillory," there is nothing peculiar to Leicestershire in either portion of the compound word; but it is needful to note that in the church of St. Helen's, at Ashby-de-la-Zouch, an instrument so called was used for the punishment of disorderly children. A lid closed down on the fingers, which were so bent that the hand could not be removed while the lid remained shut. Its action, we are told, caused no pain, and was very effective. It might perhaps be well if the revival of a punishment so harmless could be followed by the disappearance of others which are both harsh and mischievous. Nor do we quarrel with the entry "Besogne, s.b. business." Of this Mr. Evans says simply that "One old lady only, who followed the profession of charwoman, have I ever heard use this word; but with her it was habitual, 'Mind your own besogne.'" But we are not told whether the old woman had always lived within the range of the Leicestershire dialect.

It is something to learn that in Leicestershire "bleak" answers strictly to the German *bleich*. It denotes, not exposure to biting winds, but the lack of colour caused by illness. "A's a good bit better; but a looks very bleak yet." "Brig," which we get in Midlothian English, is, we are told, as common as "bridge," and carries us also to the High Dutch form. So also does *lig*, in the sense of lying or speaking falsely. "You thought a lig, Louke Hudson's pig," is, it seems, a common Leicestershire saying; and, if it be asked what Hudson's pig thought, the answer will be, "Who, a thought as they was a-goin' to kill him, an' they on'y run a ring threw it nooze." Tarpawling, Mr. Evans tells us, is inserted, not so much for any dialectal significance, as for the sake of giving a quotation which may throw light on the origin of the word. This passage speaks of "a perfect seaman, a kind of interpaulin"; and Mr. Evans suggests that the second part of the word may be a variant of *purlins*, the inter-purlins or interpawl-ings being the temporary covering of oiled or tarred canvas spread between them to keep out the wet. The name, he thinks, may have been transferred from the spaces to the material which covered them. "On the other hand," he adds, "'pauling' seems to be used in Lincolnshire for the covering of a cart or waggon, and Halliwell gives 'palliones, tents, Northumbr.," so that tarpawling perhaps may be only a *var.* of tarred pavilioning, or tent-cloth."

The reader who takes up this book with the notion of finding notices of the origin, or even the history, of the words entered in the Glossary will be disappointed. He will find a few explanations, as in the instance just cited of tar-pawling; but Mr. Evans warns us in the preface that he has "eschewed etymology, with a rigour almost superstitious; and the exceptional instances in which a derivation is suggested in no case trench upon the special prerogatives of the etymologist." But, without trespassing on this domain, there is abundance of interest to be found in the examination of the Leicestershire grammar and in the Leicestershire utterances of vowels and consonants. In his excellent remarks on the geographical and local names of the county Mr. Evans notices, as belonging to a time seemingly much later than that of the Norman Conquest, the legend which has gathered round the names of Mountsorrel, Wanlip, Burstall, and Belgrave. The earlier name of this last place was *Merdegrave*; the change to *Belgrave* must, he thinks, have been the work of a Norman owner. But, whenever the change may have been made, the story goes that a

certain giant, named Bel, vowed that he would reach Leicester from Mountsorrel in three leaps. At Mountsorrel, then, he mounted his sorrel steed. "One leap carried him as far as Wanlip in safety; but on essaying a second he burst all—his harness, his horse, and himself—at Burstall. In spite of this misadventure, Bel drove his spurs into his dying charger, and attempted the third leap. But the effort was too great. Steed and rider dropped dead together, a mile and a half short of Leicester, and are buried together in one grave at Belgrave." Whatever be the value of this tale in other respects, it proves, Mr. Evans rightly adds, that the Leicestershire pronunciation of *one* and *leap* (Wanlip) has remained unchanged since the days when the story was put together.

Of the introduction we can only say briefly that it is admirable. Mr. Evans has traced with the greatest clearness the streams of circumstance which determined the relations of Leicestershire speech with that of Northumbria and Wessex, and ended by making the Leicestershire dialect the standard speech of Englishmen. Excellent as this introduction is, its matter is scarcely a subject of controversy. The readers of Mr. Freeman's *Norman Conquest* will be well prepared to admit Mr. Evans's conclusions. They may perhaps also share the enthusiasm with which he speaks of the dialect as "the Boy born to be King":—

Every mishap that threatens disgrace and death in reality but hoists him higher and higher up the steps that lead to the throne, until, almost before the shrewd and kindly peasant becomes conscious of his destiny, the old discomfited royalties are fain to kneel before him, where he sits paled in purple and crowned with gold, grasping the inevitable sceptre in his great brown right hand, and in his left the girdled robe and cross, the chosen lord of realms which the "vast of night" is not broad enough to overshadow.

The dialect of the Leicestershire gentleman became, as Mr. Evans says, the English language. Whether this language will outlive the assaults of fine writers and fine speakers, who are fast degrading it to a wretched jargon, we cannot tell.

#### LIFE OF SIR WILLIAM GOMM.\*

WE do not often come across letters at once so manly, modest, animated, and picturesque as those which go to make up the bulk of this volume. They were addressed—the larger part of them—by Sir William Gomm, from scenes of war and horror in Flanders and the Peninsula, to his only sister at home. The correspondence opens with the year 1799, and is not carried in this volume later down than 1815, which saw the close of Sir William Gomm's actual fighting career. In the former year he writes to an aunt, in reply to kindly words of counsel:—

"Think not that whilst I strive to discharge my military duties I shall forget my religious ones. I have always thought that he who observes the former and disregards the latter is at best but a civilized brute. He who wishes to be styled a 'great man' must, in my opinion, look upon his religion as the foundation of his greatness. Courage, humanity, clemency, and all other virtues that constitute the 'hero' will necessarily follow. The character of Rollo in *Pizarro* (which I suppose you have read) is that which I should choose to follow. I can never enough admire it."

We quote this extract partly because it is a remarkable production for a boy of fourteen, but chiefly because the boy carried out in their integrity the principles he thus early expressed, through a life of ninety years, till he died crowned with honour. The present generation of officers has fallen upon slow times; for young Gomm was gazetted ensign before he was ten, obtained his lieutenant's commission before he was eleven, and was fighting the French in a pitched battle by the time he reached fourteen. He writes home after the fight:—"A bullet just grazed the corner of my left eye. It gave me a little headache; but there is not even remaining the least mark now, which I am very sorry for." Nothing at this time, and for many years later, appears to have afforded him so much satisfaction as a really good "hammer and tongs" business with the French; not that he seems to have borne his enemies the least ill will—indeed he seems rather to have liked them—but what he enjoyed was the "fun of the thing." And he liked it all the more if the weather was fine. One great battle was made actually "disagreeable" for him because it rained most of the time. There is not the faintest tinge of affectation in any such expressions; the writer writes just as he feels; and, indeed, his letters would be more interesting if he were not so reticent about himself.

The attention of readers will naturally be most attracted to that part of the book which treats of the great events in Spain, Portugal, and on the plains of Belgium. The criticism offered is always temperate; the ability and courage of the enemy are readily allowed; though the wanton cruelty and rapacity which stained the characters and dimmed the renown of such leaders as Masséna, for instance, never fail to evoke the writer's indignant and heartfelt reprobation. There are two curious prophecies, placed for contrast in juxtaposition, which we cannot forbear quoting. On one occasion, before Ciudad Rodrigo in 1812, Sir W. Gomm had Lord Wellington for *vis-à-vis* at a dinner given by one of the generals:—

I listened [writes Sir William] to Wellington while propounding his opinion as to what are the characteristics of a really great man—freedom from all double dealing, equivocation, subterfuge, and so forth—evidently levelling the shafts of his criticism at Buonaparte; and he wound up his

\* *Letters and Journals of Field-Marshal Sir William Maynard Gomm, G.C.B.* Edited by Francis Culling Carr-Gomm, H.M.'s Madras Civil Service. London: Murray, 1881.

lecture by declaring it to be his deliberate conviction that French domination, then seemingly established *ad infinitum* over the continent of Europe, was based upon shifting sand, essentially rotten at its foundation, and sustained by fraud, bad faith, and immeasurable extortion; and that it only required an honest understanding among the Powers of Europe, so downtrodden, to put an end to the most contemptible tyranny that ever oppressed the civilized world. I well remember the energetic utterance of these closing expressions in the midst of a pretty large dinner party.

The second is more generally known:—

It was in 1809 that Napoleon wrote to Masséna, then invading Portugal:—"Sweden has lost, through her alliance with England, the finest and most important of her provinces. This is a new example to kings that an alliance with England will lead them to ruin. When I shall show myself beyond the Pyrenees, the terrified Leopard will seek the ocean to avoid disgrace, defeat, and death. The triumph of my arms will be the triumph of good over that of evil, of moderation, of order, and of morality over anarchy, civil war, and destructive passion!"

Sir William Gomm is usually far more lenient in his judgments upon the Spanish armies and people than are English historians generally. And it must be remembered that he saw a great deal of both, and was frequently employed on duties which took him among them. It is pleasant, therefore, when recalling the often fierce and contemptuous invectives of Napier and Alison, to read:—"I declare I have never seen the Spaniards otherwise than conciliating when we ourselves have known how to behave." Of Castanos, whom Napier terms "slow and arrogant," Sir W. Gomm writes, "I have seen a great deal of Castanos, and I like him very much. I dare say he does not want intelligence or activity as a soldier. But"—and here we seem to see some explanation of British impatience with and contempt for Spaniards—"but we are always looking out for heroes and thunderbolts of war in this country, and we are out of humour with anything else." "Castanos," he says again, "is friendly to the English, not only from principle, but evidently from inclination." It is not in the courtesy of our nation to make allowances for the susceptibilities of other peoples. We are too apt to thrust our idiosyncrasies upon them, with the invariable consequence of arousing the most intense dislike. "Nowhere," says Sir W. Gomm, "is our ill-breeding (to use it gently) more conspicuous than when we intrude upon the religious ceremonies of the Portuguese, as we sometimes do. I really believe it is often done through ignorance; but it is very disgusting." And he proceeds to say how his brother officers would "appear in a Roman Catholic Church in the same humour as people go to Drury Lane to cry down or support a new play." While speaking of the Peninsula we may point out to the editor of this book a slight error into which he has fallen. At page 15 he says, "the French were completely routed at Fuentes d'Onor." At page 215 we read, "Wellington himself admitted that, had Buonaparte been there, the allies would have suffered a signal defeat." As it was, the French were never so nearly winning as on that day. "Both parties claimed the victory," says Napier. The work, we may say here, is admirably edited. It was no easy matter to fill in, briefly and completely, the intervals of Sir W. Gomm's correspondence with explanatory matter.

Sir William Gomm's "Journal of the Operations of the Army under the Duke of Wellington, from June 15 to August 8, 1815," is interesting even at this distance of time, since it was penned while actually on the march to Paris after Waterloo. In that battle the writer was hotly engaged. "I received," says he, writing to his sister, "two blows which are of no consequence, and had two horses wounded, which is of great consequence; and I am so hoarse at *hurrying all yesterday* that I can scarcely articulate." The journal is very brief, but it is remarkably accurate, considering, or perhaps because, the world was not then flooded with Waterloo histories, stories, legends, and enigmas. It was a source of gratification to the writer in after years, on routing out from an old drawer "this sketchy and sadly rusty-looking memoir," to find that "in all important details upon which it touches it was not 'exaggerating' in the heat of exaltation, nor 'setting down aught in malice,' and was at mortal variance only with such versions as have provoked it to break its rest in the present instance." He alludes here to the "sinfarromades recently put forth for the dreamy consolation of compatriots and the grave amusement of all the world beside, by those consummate masters of fiction—Victor Hugo and Thiers." There is one assertion in the journal which is sure to provoke not only comment but sharp criticism; and it will be seen that, when re-reading his memoir on the occasion referred to, Sir William Gomm qualified one or two of his former remarks, but left the assertion we refer to as it was. It is this:—

About five in the afternoon [on Waterloo day] the Prussians are observed advancing upon the right flank of the enemy's position, but their firing is still distant. The Prussian columns . . . although they had happily surmounted all obstacles, and were rapidly gaining ground upon the main position of the enemy above Planchenoit by 7 o'clock, had not formed their junction with our left wing until the third and desperate attack made by the Imperial Guard upon the British line had been completely repulsed, and the enemy was in total rout in our front.

(The italics are ours.) This assertion is all the more extraordinary seeing that Sir W. Gomm was on the British left, in the very best position for observing what occurred in the Prussian quarter; and being a Staff officer, and continually engaged on our left in various duties, such an important event as the advent of our allies on the scene could not have passed unnoticed. We fear that M. Thiers, without any need for romancing, would have made short work of Sir W. Gomm's belief. Marshal Soult writes to Grouchy as early as one o'clock, "Nous croyons apercevoir le corps de Bulow sur

les hauteurs de St. Lambert." Shortly after, Lobau, with no less than 10,000 men, was sent from in front of the British to oppose the Prussian advance. This fact in itself is sufficient testimony to the early and immense effects produced by Prussian co-operation. Their firing was certainly distant—or rather, it did not proceed from large masses—down to as late as 4 or 4.30 P.M.; but the pressure of their coming arrival had been felt by the French long before. So far from the Imperial Guard having been routed before the Prussians effected a junction with our men, the projectiles from Bulow's guns had been falling in the ranks of the Guard while posted in reserve near La Belle Alliance. And there was time afterwards for Bulow's first troops to be repulsed, and for him to attack again with his entire corps, and for half of Pirck's corps to arrive and become desperately engaged before the Guard made its onslaught. But since the appearance, in 1866, of the late Colonel O. C. Chesney's admirable monograph on Waterloo, the question as to the share taken by the Prussians in winning the battle may be held to be definitely settled. Their loss was over six thousand men; and, as there was no serious stand made by the French after the defeat of the Guard, that loss must have been experienced in previous hard fighting.

Sir William Gomm appended to his Journal a final note in which, fifty-five years after the event, and when he was eighty-five or eighty-six years old, he thus sums up his reflections upon the campaign:—

It is my faith that there were three distinct manifestations of the direct intervention of Providence in the course of the great events of 16th, 17th, and 18th of June, 1815, over the plains of Belgium. Of one of these the great Duke himself was conscious. Often when asked to what agency he attributed his escaping scatheless throughout the storm of battle on the 18th, while the chiefs of his staff clustering round him were one after another felled to the earth in rapid succession, his unvarying reply was, "It was the hand of Providence over me." A second instance was the state of persistent vacillation in which the corps of D'Erlon, 20,000 strong, was kept on the 16th—neither affording assistance to those in front of ourselves, nor to Napoleon himself in front of Ligny, to whom its arrival on the Prussian right flank would have ensured the utter destruction of that army. And a third instance, not to be substantially accounted for by classing it in the category of "great military errors," was the unbroken bewilderment of Grouchy, and the absolute retention of his 38,000 men from the field of battle of the 18th. And surely never in the world's story has an occasion for such intervention as is here reverently pleaded for been more signally presented for the confounding of measureless earth-rooted ambition, and of the appliances of transcendent human capacity for its gratification. Once more then, 'tis my faith, and upon the showing here presented, *que Thomine propose et Dieu dispose*."

One or two pretty and still popular beliefs concerning the Duke of Wellington's sayings on some historic occasions are refuted in this volume. "Up, Guards, and at them!" must now give place to the laconic and equally practical command, "Charge, Maitland!" Again, the Duke did not say to Sir Charles Napier, on receiving the news of Chillianwallah, "If you do not go, sir"—meaning to India—"I must." "The Duke was not frightened by Chillianwallah," adds Sir William Gomm. But there is one notable saying of the Duke which cannot nowadays be too widely known among us:—

The last words [writes Sir W. Gomm] that fell from the lips of the Duke of Wellington addressed to myself, when I was taking leave of him previous to my departing for the command in India, were as follows:—"The British army is what it is because it is officered by gentlemen; men who would scorn to do a dishonourable thing, and who have something more at stake before the world than a reputation for military smartness. Now the French army piqued themselves upon their *esprit militaire* and their *honneur militaire*, and what was the consequence? Why, I kicked their *honneur* and their *esprit militaire* to the devil"; and he gave a kick so enthusiastic that it nearly upset him, and prompted me to lay instantly hold of his arm to enable him to recover his balance.

For very long let us hope that in the British army may be found officers of the type of that high-minded, modest, and illustrious gentleman—"first a Christian, then a soldier"—Field-Marshal Sir William Maynard Gomm.

#### THE ENGLISH CITIZEN.\*

"ANOTHER series of handbooks!" is the natural outcry when the reader beholds the neat drab covers of Mr. Traill's little book; and another series it turns out to be. The English citizen is to be informed of his rights and responsibilities in some dozen little volumes, of which Mr. Traill writes the first, while the others seem to be assigned for the most part to well-known and capable writers. The English citizen cannot complain that he is handed over *τῷ τυχερῷ* when Mr. Frederick Pollock undertakes the charge of instructing him about his "Land" (if he has got any) "and its relations to the State"; when Mr. T. H. Farrer promises to tell him all about "The State and Trade," and when Mr. Stanley Jevons grapples with the intricacies of "The State in connexion with Labour." We cannot, indeed, get over a certain old-fashioned feeling that it is a better, if a more rough-and-ready, method of learning the rights and duties of a citizen to practise them, to study them in history and in current business, than to get them neatly catechized out of neat calico books. But this is a previous question which seems to be decided against us. Everybody has bowed to the new system by reading serial handbooks, and not a few people are disabled from objecting very seriously by having actually written them. The speculative anthropologist may indeed feel a curious longing to know what a man would be like who had

\* *The English Citizen—Civical Government*. By H. D. Traill. London: Macmillan & Co. 288s.

been brought up exclusively on handbooks, as well as a certain suspicion that he would not be good for much either as a citizen or a scholar. But all this may be allowed to pass.

Mr. Traill's subject is the Central Executive Government of England and its subdivisions. That is to say, he gives a chapter to executive government under the constitutional system, another to the Cabinet, and then one apiece to the great offices of State—the Treasury, the five Secretariats, the Admiralty, the Boards of Trade and Local Government—with a short *omnium gatherum* of minor offices, a section on the Privy Council, and a finale on "the tendencies of central government." Each of these subdivisions of the subject is treated both historically and in reference to its actual condition. This scheme Mr. Traill has carried out with a great deal of knowledge and in an excellent manner. He is known as one of the most accomplished publicists (to use the word in its French rather than its English sense—the sense, that is to say, of a journalist who devotes himself principally to politics) of the day; and his accomplishments appear to include a knowledge of literature and history which, to judge from results, is unfortunately not common among English journalists nowadays. A clear and straightforward style enables him to put his knowledge in a way at once concise and lucid; and he has almost invariably resisted the temptation to talk "about it and about it," instead of giving the information which his title and commission invite him to give. It is almost unavoidable that there should be differences of opinion about the matter of such a book. Even those who know best that there is no such thing as a cut-and-dried British Constitution (and Mr. Traill certainly knows this) are wont, especially when they have to write about it, sometimes to slip into phrases which look as if they did not know it. Again, constitutional history is by no means made up only of accepted and agreed statements, and each writer upon it naturally takes his own view, and, when writing concisely, is apt to state that view, not as a view, but as a fact. We doubt, for instance, very much the statement (which Mr. Traill feels to be dubious enough to require the support of a note) that the advisers of the sovereign were at any time regarded as not responsible in any formally recognized way to any one but himself. The mere mention of the word "impeachment" seems to upset Mr. Traill's position, and it may be observed that throughout his book there is a confusion, which sometimes results in statements both erroneous and practically dangerous, between Ministerial responsibility and Parliamentary control. The former is now practically and absolutely, and has always been theoretically, the rule of the English Constitution; that is to say, it is not easy to point out any period of history when the mere production of an order of the king would have theoretically sufficed to clear a Minister or an adviser, though there are, doubtless, many periods when it would have been accepted as practically clearing him. It is in Parliamentary control before the fact, not in Ministerial responsibility afterwards, that such enormous alterations have been made, and the former has not yet entirely overtaken the latter in practice, though of late years it has very nearly done so. To illustrate what we mean, let us quote a very important passage where, as we think, Mr. Traill has gone quite wrong, and has, by adopting a weak position, instead of a strong one, made a dangerous concession to current fallacies:—

And, in the second place, there is a part, and a considerable part, of the negotiations carried on between English ministers and the Governments of foreign powers, which not only must not be prematurely communicated to Parliament, but in many cases cannot even be communicated at all,—negotiations which, as between the Governments engaging in them, are of a strictly confidential character, and are so understood to be by all the parties thereto. It might, no doubt, be urged that the obligation to secrecy is one which an English Government has, as against an English Parliament, no power to contract; and upon a strict application of the principle of ministerial responsibility, this is no doubt true. But the question, if it is to be reasonably considered, must be treated as one not so much of constitutional principle as of practical expediency. Parliament might be within its right in compelling an English Government to divulge matters of confidential communication with other Powers, and such other Powers might have no reason to complain of the non-fulfilment of undertakings which those who entered into them had no authority to contract. But, whether they could reasonably complain of this disappointment or not, they would assuredly resolve not to subject themselves to it a second time; and in mere self-defence they would, for the future, decline to communicate anything to an English minister which they were not prepared to see published to all the world. How serious a disadvantage our Government would be subjected to in their intercourse with foreign Powers, if such a course were to be adopted by the latter, it is unnecessary to point out.

On the whole, therefore, the point appears to be one on which the strict principle of ministerial responsibility has been wisely relaxed.

If any one will read this passage carefully, he will see that Mr. Traill is clearly mistaken in using the words "Ministerial responsibility" in the passages which we have italicized, and that he should have said "Parliamentary control." This has not been "wisely relaxed," because it has never existed, and never could exist without utter chaos and ruin. If it be admitted that "an English Government has no power to contract obligations of secrecy as against an English Parliament," the conduct of foreign policy becomes impossible, as Mr. Traill clearly sees. Accordingly Parliamentary control before or during negotiations or warlike transactions is as certainly excluded by the Constitution as anything can be excluded when there is no written document in question. But the principle of Ministerial responsibility is not in any way relaxed or impaired. The Minister or the Cabinet (if acting jointly) are still theoretically answerable with their heads for the results of their doings, and there cannot be any much greater responsibility than this. But, by admitting

without reason or necessity, and owing to a positive confusion of terms, that the uncontrolled initiative in foreign policy only belongs to Ministers by a "relaxation" of Ministerial responsibility, Mr. Traill has, doubtless unintentionally, favoured doctrines which within the last few years have already hampered England almost fatally, and which, if admitted, must simply deliver her over, bound hand and foot, into the hands of her enemies. The error in question is more succinctly put earlier in the book, where Mr. Traill says that the direction of foreign policy by the Crown in the days of William III. and the early Hanoverians was "a permitted departure from the principle of Ministerial responsibility." It has been sufficiently pointed out that there was no such departure at all.

This, however, is the only grave constitutional mistake which we can find in the book, and this itself is probably in part an error of language. Some slighter things may be noticed. The saying that a sovereign "cannot constitutionally preside at a meeting of the Cabinet" contrasts oddly with a subsequent and perfectly correct statement that the Cabinet "remains to this day unknown to the Constitution." It is not clear how the Constitution can forbid the presence of the sovereign, or any one else, at an assembly of which it ignores the existence. As a matter of fact, it is difficult to say positively that it would be unconstitutional for the sovereign to be present (as he has actually been in times past). All that can be said is that the practice has been long disused; that a kind of etiquette has grown up forbidding it; and that, under existing circumstances, it would be extremely inconvenient to revive it; but it is not surprising that there should be some slips in language in a matter where so much depends on individual opinion, and so much more on individual skill and luck in formulating opinions which are generally held, but which have nowhere received authoritative expression.

There are but few omissions in this book. The really important constitutional innovation of a Scotch Deputy Home Secretary, distinct from the Lord Advocate, had probably not been made when Mr. Traill's account of the Home Office passed through the press. In his account of the Treasury it might have been indicated, but would not have been unimportant or uninteresting to the English citizen, if Mr. Traill had divulged the full extent to which the permanent officials of that institution exercise a power of modifying, regulating, and occasionally thwarting the decisions of the House of Commons. Perhaps, however, he was wise not to meddle with the secrets of the prison-house, curious though they are. In his chapter on the Privy Council one function of that body—small, but, from a constitutional and historical point of view, extremely interesting—is omitted. The Privy Council acts as the link between those parts of the United Kingdom which are directly represented in Parliament and those which are not—such as the Channel Islands. When an Act of Parliament affecting these islands is passed, an Order in Council directs its registry by the local "States" or "Court"—for the practice differs in Jersey and Guernsey—and it is only after such registration that it has the force of law. A curious point is that in practice, if not in strict theory, the joint action of Parliament and Council is necessary. If the Channel Islands are not named in the Act, an order of registry, even if issued, would be neglected; and if they are named, and the order of registry were omitted, it would probably be ignored, though a clause to the effect that in such cases the order is not absolutely necessary is usually inserted in it. Such as it is, this practice seems to be a relic of a time when, as in France under the old *régime*, a royal edict required registration by the local Parlements, though such registration could be imperatively demanded. This function of the Privy Council is a survival curious enough to find a place in such a volume.

Although we have found reason to differ with Mr. Traill on some points (of one at least of which the importance can hardly be exaggerated) we are very glad to repeat what we have said at the beginning of the general merits of his book. In a matter where such exclusion was not easy, he has rigidly excluded partisan treatment; indeed in some points he seems, probably from an excessive desire to be impartial, to lean too much to the side to which (if the bull may be permitted) he does not incline. Luckily Central Government is a subject which can be satisfactorily handled in this way. We own that some of the volumes advertised as forthcoming seem to us to deal with subjects which it is next to impossible to approach except in the spirit of one or other party, and this may be taken to be something of an objection to the scheme; but from any such drawback Mr. Traill's subject and his treatment are alike free.

#### THE RIVERS AND RAINFALL OF INDIA.\*

THE question whether there shall be famine or plenty in India naturally depends on the supply of water. Now the sources of supply are of three kinds. There are the rivers fed by the melting of the Himalayan snows; there is the annual rainfall; and there is the supply raised from wells or stored for years in tanks. The extremes of the rainfall in different parts of the plains of India range from six or eight to about one hundred inches. In Bikanoor for instance, the driest part of Rajputana, the annual fall rarely exceeds the first figures. In the most

\* *The Imperial Gazetteer of India*. By W. W. Hunter, C.I.E., LL.D., Director-General of Statistics to the Government of India. 9 vols. London: Trübner & Co. 1881.

eastern districts of the Province of Bengal the rain-gauge between May and October registers little less than one hundred inches. Mr. Hunter's volumes teem with statistics and details of climate, temperature, and atmospherical phenomena; and some of the best parts of the *Gazetteer* are the notices of large rivers. We propose in this paper to treat of the characteristics of several of the less-known tributaries of the Ganges and others, and their effects on agriculture, commercial enterprise, and social habits.

Mr. Hunter says truly that the trade by boats in Central, Eastern, and Lower Bengal is, "for magnitude and variety, quite unique in India." Englishmen may sometimes hastily conclude that the network of rivers for which Bengal is celebrated, is confined within the area of the Sunderbund Forest. But it would be more correct to say that a merchant or traveller can embark in a canal within three miles of Government House, Calcutta, and not only thread his way to stations and marts in Backergunge, Chittagong, Tippera, and the Eastern districts, but also reach Assam, Behar, Allahabad and Agra, and the district of Meerut in the Upper Provinces. Before the age of railways, the time allowed to officials, military and civil, to get to the capital of Assam was forty-seven days; and four months was the period in which a batch of young civilians or a convoy of recruits was expected to reach Ghurmukhteser Ghaut, about twenty miles from the fine cantonment of Meerut. Grand military highways and railways in succession have changed all this, but the traffic on many rivers is still largely carried on by native craft as in the days of Warren Hastings; and reckoning the import trade into Calcutta from the interior at about twenty-six and a half millions, we are informed that of this amount thirteen millions were imported in one year by two lines of railway, two and a half millions by river steamers, one million by road, and ten millions by country boats. This local traffic remains mainly in the hands of natives, who employ boats of every conceivable size and build. Boats and boating and fishing castes have a peculiar nomenclature of their own. Doubtless the obstacles under which internal trade was carried on through the Padma, the Megna, and the Nudda rivers, one hundred years ago, have been lessened or removed. Tolls and vexatious restrictions have all but disappeared. Short cuts have been made in some instances, and channels scoured and deepened in others. Dacoities, or organized attacks by robbers on boats laden with valuable cargoes, though occurring occasionally, no longer strike the Mahajans of Calcutta with a perpetual sense of insecurity. These speculators may dread losses by fire or by the rascality of their own crews and supercargoes; but, as a general rule, the waterways are almost as secure as the Thames or Severn. There is still the recurring danger of a cyclone at the beginning or the end of the rains; and every now and then we are sure to read of fleets of hundreds of vessels wrecked or sunk, of huge ships and steamers left high and dry in a rice-field many feet above high-water mark, and of a tidal wave which submerges a whole island or peninsula with its cattle, produce, houses, and several thousands of human beings. No vigilance can anticipate or remedy these disasters, and storm warnings can scarcely reach many for whom they are intended; but still, in spite of hurricanes, sandbanks and shoals, rapid currents and shifting beds, the inland river commerce of Bengal in rice, wheat, hemp, oil seeds, and other local produce is probably brisker than it was when the province had not a mile of railway, nor a road that could bear wheeled carriages except during the dry months of the year. Several of the tributaries send down a volume of water which in the cold season nearly equals that of the Ganges. Here is a précis of Mr. Hunter's account of the Tista. It rises—for this is doubtful—either in Independent Sikkim or in Tibet, or in both countries. Its upper reaches display rocky pools, huge boulders, wooded banks, and picturesque scenery. When it descends to the plains these peculiarities are exchanged for a fine channel often eight hundred yards wide, which, even where the volume is least, will float vessels of three and four tons burden. The history of the freaks of this stream is very suggestive. In the survey of Major Bannell, made some hundred and ten years ago, the Tista flowed due south, joined another river in Dinapore, and finally emptied itself into the main stream of the Ganges. In 1787 the Tista was choked by excess of silt and burst its banks, when the accumulated waters forced their way into a small branch, which, after flooding the country and causing immense damage, they gradually so enlarged as to form a junction with the Brahmaputra which still exists. It is a dispute amongst philologists whether the Tista is derived from one Sanskrit word which signifies "thirst," or from another, "the three streams." Similar eccentricities are recorded of the Jamuna or Jamuna, a river of Northern Bengal, with just this difference, that in Kennell's time it joined the Brahmaputra, whereas it now joins the main stream of the Ganges near the railway-station of Goalundo. On the Jamuna is situated the well-known, populous, and important mart of Sirajgunge, perhaps the richest of all the centres of trade in the interior of Bengal. Thirty-four years ago this capital of the trade in jute stood on the banks of the river. In 1848 the floods carried the town clean away, whereupon the traders formed a new bazaar on the new bank, five miles from the original spot. When the stream, in another sudden caprice, went back to its old bed, the traders, warned by experience, preferred remaining where they were. Huge boats are now moored in the mid-stream miles from the bank, and business is done, not in the bazaar but by merchants and brokers who move about in small boats, or traverse what, in the hot season, is a blinding waste of sand some miles in extent. Hence the real Sirajgunge has been happily described as a town

without houses. But it has a population of 18,000, and an aggregate trade, imports and exports, of 3½ millions. It is notable that Calcutta, to which the jute is exported, can be reached from Sirajgunge by rail in two days, by steamer in eight or nine, and by country boats in thirty. But the difference in the freight of the latter as compared with the two former modes of conveyance, is as sixpence to tenpence-halfpenny for the *maund*, and this goes far in the eyes of a clever, calculating Hindu.

Graphic as are the descriptions by Mr. Hunter and his colleagues of the metamorphoses in the rivers of Bengal, they must be seen and even heard to be properly appreciated. Diluvium and erosion do not proceed on those plains by cold gradation and well-balanced form, as in temperate climates. In the dry season huge masses of earth can be seen falling every minute under the action of an undermining current. Boats have been swamped by avalanches of sand and silt coming down suddenly on their decks; the noise of these falling bodies can be heard, the splash can be seen, several hundreds of yards off; and the injuries to landed—or what in India is misnamed immovable—property caused by such vagaries are the despair of surveyors and the harvests of men who live by promoting lawsuits. But the action of the current, though it can be watched and registered from November to May inclusive, defies observation and prediction when the volume of water, already increased by the Himalayan snows, is swelled by ordinary or abnormal rains. For two or three months all channels are united in one huge expanse of water, miles in breadth. The surrounding country is an inland sea, in which the green rice-stalks hold their own against the flood, and over which communication is maintained in skiffs and canoes between one village and another. By the month of October the waters subside and a revelation takes place. The main channel of the dry season which last year flowed under the mart of Rajgunge to the east, now passes close under the village of Bamunhat to the west. One landholder cannot find several hundreds of his acres of choice alluvial formation, as they have gone to swell the properties of half a dozen riparian proprietors a little further down the stream. Another landholder is so far more favoured that while the river has cut a new bed right through the best part of his *zemindari*, it has left unharmed certain well-known landmarks by which he can identify, follow, and reclaim his property. The old factory of Nilabad, which, built with a solidity and on a scale peculiar to the last century, had withstood floods and cyclones, the failure of great Calcutta houses, and the refusal of ryots to fulfil their contracts during the indigo disturbances, is threatened by a dark and turbid current, which is running within a few yards of the kitchen-gardens and the unconsecrated burial-ground where lie with almost illegible inscriptions the pioneers of British civilization, hardy and adventurous Scotchmen from the North. The Cutcherry of the Joint Magistrate at the new Subdivision has been carried away bodily; and that of the Judge of the Court of Small Causes is inevitably doomed unless the next rainy season shall again work fresh miracles and send the main stream miles away back to its original bed. This is, in sober truth, a sketch the main features of which will be attested by any one who, as district officer, silk merchant, or indigo planter, has resided for a few seasons on the banks of the Ganges, the Jamuna, the Gorai, or the Kumar.

The Mahanuddi or Great River, in the Province of Outtack, rises like the Tista in a mountainous and wooded region, and, after a tortuous course between ridges of hills and over ledges of rocks, divides into two or more main channels, and has often threatened to sweep away the town of Outtack. But here the volume of waters has been confined, mastered, and utilized by engineering skill. A series of canals has been commenced and nearly finished, which, at a considerable and as yet an unremunerative outlay, will probably guarantee the province against a recurrence of the terrible famine of 1866.

In comparison with the rivers of Bengal and Orissa those in Upper India work fewer changes in a different soil of undulations, rocks, and red clay. The Ravi in the Punjab is the Hydrates of Arrian, which looks as if the Greeks had endeavoured to coin some term expressing "water" out of a fancied resemblance to the real original name, the Sanskrit *Iravati*. This stream has been utilized to supply the Baree Doab Canal, one of the great re-productive works designed by the Board of Administration, under the guidance of Lord Dalhousie, soon after the annexation of the Punjab. In March and April its depth on the borders of the district of Amritsar is not more than a foot. Between June and September it rises to eighteen or twenty feet. The main bed alters but little, and the greatest volume of water only floods a mere fringe on either bank. It plays consequently none of the fantastic tricks which in Bengal cause anxious administrators and traders to weep; but we are reminded that in 1870 it carried away a Sikh shrine of notable sanctity near Dera Nanuk; and that it still threatens more damage. In like manner the Jumna at Agra once sent a sensation throughout all India by menacing the Taj Mahal; but for many years this latter stream has been bridged by a line of boats, and amongst the modern sights of Upper India are the splendid railway bridges which span it at Delhi, Agra, and Allahabad. Bridges of boats have also been constructed over the Jumna at a dozen other places. In the district of Jalaun some of the smaller streams have got into a kind of trick of draining the uplands by a series of ravines, and are said to impoverish the soil instead of watering it. Probably the finest irrigation works in India, always excepting the Great Ganges Canal, are connected with the Sonu river, said to be the only great tributary of the Ganges that is not fed by the

snows. It has for some time past been conclusively established that the river is the *Erano-bos* of Ptolemy, for such to Grecian ears doubtless sounded its ancient name of *Himnyabahu*. With all respect to Mr. Hunter, this is the correct spelling, and it means "gold-bearing." *Hiranyabahu*, in the *Gazetteer*, the "golden-armed," may be a title of Siva but it is not the ancient name of Sone. In former days, during the dry season, the bed of this river had neither water enough for a ferry-boat nor solidity enough for a road. An ordinary traveller took, at the least, three hours to cross the waste of sand over which his light travelling carriage was slowly dragged by six bullocks. To a convoy of traders with their carts, or to a regiment with its tents marching to a new station, the Sone represented a whole day's work. The passage is now accomplished by trains on the East Indian line in a few minutes, over a lattice girder bridge not very much short of one mile in length. The irrigation works, like those on the Godavary in Madras, depend principally on a magnificent Anicut or dam, 12,500 feet long by 120 broad. Nearly three millions sterling have been spent on the Behar Canals, which have already irrigated about 300,000 acres and can command a far larger area. But whatever be the character of Indian rivers, whether icily cold from the snowy range, or clear and cool like those in Central India, or turbid, sluggish, and deep, like many in Bengal, or violent, impulsive, and ungovernable, it may safely be laid down as an axiom that no damage done by the largest floods of the heaviest rainy season ever equals the destructiveness of a long protracted drought. Even the tidal wave which swept over Sandip in 1876, and Saugor island in 1833 and again in 1864, filling the tanks with brackish water and sweeping away human beings and cattle, with houses and chattels, in the space of three or four minutes, never produced such intense suffering or left such traces as the famines of Orissa, of the North-West Provinces, and of the Madras Presidency. The worst legacy of the wave of a cyclone is that the soil is encrusted with salt, and that the want of pure water exposes survivors or new-comers to dysentery and intermittent fevers. But no such consequences follow on the inundations caused by heavy rains and melted snows anywhere above the tidal limits. Tanks are refilled; ditches are well scoured; cholera and small-pox are checked; and deposits of fertilizing silt, measured by inches and occasionally by feet, convert wastes into rice lands and rice lands into gardens and orchards. Moreover, the area affected by an inundation, though large according to European notions, is really insignificant compared with that ruined by an endless hot season. It may be added, too, that owing to the annual overflow of its network of rivers, the level of the plains of Lower Bengal is gradually rising, while every now and then the whole aspect of nature is suddenly and beneficently altered. Some thirty years ago a plain covered with *bona grass*, "the haunt of coot and heron," and also the preserve of wild hogs, was suddenly ruined in the eyes of sportsmen by a tributary of the Ganges which brought down in one rainy month a deposit of dark silt several feet in depth and many acres in extent. The khyots on the cessation of the rains had only to turn out and scratch the rich mud with the lightest of rustic ploughs, to gather two crops in the next year.

Irrigation from deep wells seems to have found more favour in the eyes of natives than from tanks. In some parts of Western Bengal, and in several of the Madras districts, reservoirs have been constructed before and during the British period without Government aid, by the agricultural community for their own purposes. In Mooltan a large extent of country had been irrigated by canals and watercourses connected with the Sutlej, under the Sikh Administration. Indeed it would be absurd to suppose that Hindus would not in some shape or other store up or guard an element which is a necessary of existence and the object of their constant prayers. But unless some powerful Raja or Nawab chooses to carry out a system of water-works on a grand scale, over-riding every obstacle and digging the trench or cutting the tank just where he likes, native communities, with a few notable exceptions, are too much isolated and divided by castes and feuds to combine long for these beneficial objects. Now and then we come on relics such as inspired Burke with his glowing picture of the graspings of an insatiable benevolence. One scheme in the Central Provinces, as described by Sir Richard Temple in his picturesque style, has so captivated Mr. Hunter that he quotes the passage twice, once at p. 68 and again at p. 353 of Vol. II. Sir Richard, when Chief Commissioner of the Central Provinces, in a passage too long to quote, glowingly expatiated on what he termed the Lake district of Bhandara. It is watered by the Waingunga, and noted for no less than 3,648 tanks made by native engineers, who availed themselves of the dips and hollows of an undulating country and constructed dams where the ground sloped. But, owing to misgovernment and Mahratta raids, the banks of these lakes are now overgrown with jungle, and a scanty population lives in terror of wild beasts.

A community depending mainly on agriculture must have the liveliest interest in all material works that store the excess of one season to supply the shortcomings of another. There are naturally some things which we cannot expect from the ordinary Talukdar, tenant proprietor, or village community. Neither associations nor individuals can be asked to supply capital for joint-stock Companies to make long canals or reservoirs acres in extent. But they are often aided to dig wells, and they might be taught to replant trees on soil fitted for no other product. The continuous denudation of extensive tracts in such fine districts as Midnapore, Bankura, Birbhoom, and Burdwan, without any corresponding

development of agriculture, is said to have perceptibly decreased the rainfall and the power of the soil to store water. Some fifteen years ago this fact was formally brought to the notice of the Government of Bengal. But the rights of large Zemindars under the Perpetual Settlement are invariably pleaded against interference by the State in almost anything tangible, and in favour of utter neglect of their duties by landholders. We hope that by the spread of both railways and canals in the next ten years, the famine, when it does recur, may be coerced into smaller limits, and Mr. Hunter's nine volumes are valuable guides to show how "the resources of civilization" can be made available for the primary duty of keeping British subjects alive.

#### HER MAJESTY'S PRISONS.\*

IT is likely that in the eyes of Common Law barristers, stipendiary magistrates, governors of prisons, turnkeys, warders, and police constables, all the world deserves to be locked up for various periods; and from this point of view it would seem a matter of personal importance, apart from philanthropic considerations, to know exactly what goes on in the places called by the author "*Her Majesty's Prisons*." To know beforehand what one may expect in case of being found out should make one very careful not to be found out; such knowledge may even make some few change their line of conduct; indignation at the possibility of the treatment endured by this anonymous sufferer may lead to terror, and terror to repentance, and repentance to a general elevation of the moral standard. Wherefore let the unconvicted make a note of this book.

The author of *Her Majesty's Prisons* describes himself as "one who has tried them." He "qualified" by an act, or series of acts, which he very modestly passes over in silence. Let us be content with the knowledge that he "did something," probably connected with somebody's money; that somebody found him out; that there was a preliminary appearance before a magistrate followed by detention in prison, bail being refused, until the time of trial; and that there was a period of twelve months—"hard"—to be worked out. The man who did the something and worked out the twelve months is so obviously a man of weak knees and groggy moral principle that we are not in the least inclined to sympathize with him. Whatever he was accused of doing, there is an apparent likelihood that he did it; he lacks the impudence with which some guilty men proclaim their snow-white purity; he contents himself with a fling at his solicitor who got up his case so badly, and his counsel who, so instructed, gave up the case from the beginning. We make little doubt—though we are far from considering his case as exceptional, or otherwise than a little unlucky—that he got off easily with a year's hard labour. When men of his position, which was evidently a respectable one, do get into difficulties of this kind, it is almost always over trust money, or other people's money, or a mixing up of accounts; and there is no doubt that when the blow falls and the constable appears with the warrant, the first feeling is one of un-mixed disgust, with surprise that a criminal proceeding should follow a line of conduct practised, though in a less overt manner, by so many of one's friends in the same place. The offender knows—everybody knows—that all sorts of strange things are constantly being done, especially by low class attorneys, house agents, money lenders, furniture dealers, and so forth; in country towns one hears the most astonishing stories about people who walk the streets brandishing a silk umbrella instead of a handcuff. Even in London, where one is supposed to know nothing of one's neighbour, shopkeepers whisper about respected citizens things dreadful, things *tacenda*; and they will sometimes tell you, in taverns, wonderful stories about some silent, harmless old frequenter. There was, for instance, a place, not more than ten years ago or so, where the waiters would whisper to you that at the next table sat "the murderer," with the definite article. He came every evening, unrepentant, and was a beautiful old man with creamy white hair, a benevolent eye, and a sweet smile. They said he had murdered his ward for the sake of money. Considering the many cases which we all know of people who have "done" something and have escaped, we are not astonished that the writer of *Her Majesty's Prisons* should have been surprised when justice overtook him.

As the charge against the author of this book was apparently one of an aggravated kind, which did not admit of bail, he had to remain in confinement while awaiting his trial. He makes out a very strong case against the justice of the country as regards the treatment of men in this position. They are locked up in separate cells, a thing which would seem desirable to all but the habitual criminal. They are not allowed more than a certain small quantity of beer or wine. Their names are written up on cards placed on their doors. They have to go to bed at eight and to get up at six. They are only allowed a quarter of an hour or so every day for exercise. They have got to attend chapel at the same time as the convicts, though they do not sit among them. They can only use tobacco if the doctor orders it; and, unless they can pay for their own food, they are put upon a dietary which is in itself a cruel punishment for a healthy man. For instance, the Sunday allowance, facetiously called dinner, consists of four ounces of bread, six ounces of potatoes, and six ounces of suet pudding. On

\* *Her Majesty's Prisons; their Effects and Defects. By One who has Tried Them.* London: Sampson Low & Co. 1881.

Monday the scale offers a choice; a man may have six ounces of bread, eight ounces of potatoes, and three ounces of cooked beef, or the same quantity of bread and potatoes with three-fourths of an ounce of fat bacon and seven ounces of beans. One wonders whether the people who complacently draw up these dietaries ever try to realize what it means to give a man for dinner nothing but two ordinary-sized potatoes, with a handful of beans and a piece of bacon as big as his thumb. And this, not for convicted men, but for prisoners only sent up for trial, and therefore presumably innocent in the eyes of the law. The treatment of such cases is, one is well aware, of peculiar difficulty. In most of them there is little room for any doubt on the subject at all; the man is either an habitual criminal, or the evidence is clear and the guilt of the defendant abundantly established. So that one may consider this condition a kind of purgatory through which the criminal passes on his way to a worse place still. It is part of the punishment which he has drawn upon himself. But there are other cases in which the man is absolutely innocent; for his sake all such cases should be treated alike; the dietary should be simple but liberal; the means of exercise should be freely granted; the use of tobacco should be allowed; and the irritating restrictions as to half a pint of wine or a single pint of beer should be removed.

When we come to the treatment of actual convicts, our sympathies are naturally less easily aroused; and, in fact, the man "who has tried the prisons," and is desirous of "exposing the ill-treatment and petty tyranny existing" in them has a very weak case indeed to show against the present system. The regulations relating to the treatment of convicted criminal prisoners appear framed with becoming attention to protection as well as to punishment. They have got to keep their cells clean, to behave quietly, and to do what they are told. If they destroy the prison property, or assault an officer, or mutiny, they must be flogged. Our author makes a great crying-out about the "crushing of better feelings" in the men flogged; but surely no prisoner whose feelings need to be consulted, with the knowledge before him of the punishment which inevitably follows, will desire to assault officers or to rebel. As regards labour, the prisoners have to work ten hours a day, those in the "first stage" being exercised for six to eight hours a day on the crank. Ten hours a day seems to be a long spell, but there is no cruelty in it; a very large proportion of mankind work for a longer time every day; probably, too, the ingenuity of men accustomed to convictions enables them to get through the day's work without too much fatigue. By working steadily and by good conduct the prisoner can get out of the first stage in a month, when he goes on to what is mysteriously called "hard labour of the second class." This kind of labour, however, is nowhere defined. The first month must, indeed, be a time of considerable discomfort. The patient, so to speak, has to work in strict seclusion; he sleeps on a plank; he earns no gratuity; he has no books and no instruction; he gets no exercise on Sunday. Great use is made of the plank bed; and it is not until the prisoner arrives at the fourth stage, when the hardness of the bed may be supposed to have thoroughly revived and refreshed the moral sense, that he is allowed to sleep on a mattress every night. As regards the diet, prisoners sentenced for a single week get nothing but bread for breakfast and supper, and stirabout for dinner, so that they go out hungry, if not penitent; those on longer sentences get meat twice a week—namely, three ounces of cooked meat, which is equal to about one small slice, with bread, gruel, potatoes, and suet pudding on other days. The publication of this dietary, which cannot be too widely known, ought to act as a most wholesome deterrent from crime. The convict uniform, the cutting of the hair, the early bed, and the loneliness of the cell are things in themselves excessively painful to consider; but these are trifles light as air compared with the mockery of the dinner and the ghosts of breakfast and supper. The chaplain does not appear to have given much satisfaction to the writer; but then, as regards chaplains, the opinions of prisoners may differ; and it certainly does not appear to be in the best taste to draw what is clearly a portrait of the good man. We are, however, quite agreed with the writer on the uselessness and absurdity of the crank. Surely it would be possible to invent a method by which the labour of prisoners could be utilized so as to produce something, and to put an end to the folly of setting thousands of men daily to turn a stupid handle which does nothing.

The sad monotony of prison life leaves little to be said when the rules and occupation of the day have once been told. The writer was transferred from one prison to another, which seems to have been an agreeable break in the monotony of his "time." Else there is nothing more to tell, and the second volume is padded out with complaints of favouritism, brutality, neglect, and so forth, on the part of the prison officers. But, so far as the author was concerned, he seems to have experienced nothing but uniform kindness and consideration. No doubt these were extended to him partly in recognition of obedience and orderly behaviour. The "cases" he quotes do not, somehow, read with the right ring; one would like to hear the evidence on the other side; some of them seem to explain themselves. Thus, a prisoner is taken ill in the night; there is no machinery for giving him a cup of tea; one of the warders has to do it at his own expense, and grumbles. Another warder has favourites, and keeps some of the men on the crank longer than others. Another swears and bullies the prisoners while at exercise, and so forth. It is really impossible by any Government regulations, or by rules of any kind, to enforce equitable, kindly, and

compassionate treatment of prisoners; nor can any rules ensure a desire on the part of the prisoners to fall in with the discipline of the prison, especially as regards silence and zeal while on the crank. Therefore we make no doubt that there are many cases in every prison where a man is unfairly treated by the warders, and the only remedy we can suggest is that Governor and Visiting Justices should be so constantly patrolling a prison as to minimize the chances of petty tyranny. One or two weak points are, however, pointed out by the author of these pages. The first is that already indicated—the irrational use of a perfectly useless machine; the second is the miserable scale of food, which can only be excused on the presumption that the men do so little work and take so little exercise that, like the lions at the Zoological Gardens, they must be kept low; and the third, which is really a most disgusting and abominable grievance, is the use of the bath. The regulations provide that all the prisoners should take a bath once in fifteen days, at least. At the prison where our author "worked out" the greater part of his sentence, this rule was systematically broken, and the prisoners only got a bath once in five weeks. Probably to most of the men in confinement the infringement of the rule was a welcome let-off, because the habitual criminal loves not water for any purpose except to mingle with gin. When it did take place, the bathing was held in a slate bath seven feet long, two deep, and three broad. In this bath, containing forty-two cubic feet of water, sixty men had to bathe in two hours and a half. This allowed, for each man, two minutes and a half for undressing, bathing, and dressing again. The water was changed only once during the whole time, each man having to soap and wash himself. Now, without being sentimental, we may fairly assert that no man can possibly have been so wicked as to deserve the sentence of bathing last—thirtieth—or even last but one—twenty-ninth—in such a bath.

BY THE TIDER.\*

THIS book is the story of a grievance. It is a novel with no hero, and with a heroine who has no lover and no friends. The first book of the author which we had met with—*Signor Monaldini's Niece*—was certainly much above the average of novels, especially of that class of them, now so frequent, which treat of Italian life. That story, in spite of some extravagances, showed freshness and power; and it also showed, what stories of Italian life seldom do, some first-hand knowledge of the world described in it. The novel before us gives, however, no fulfilment of the promise displayed in its predecessor. It is an illustration of a saying of Dr. Oliver Wendell Holmes, that any clever man or woman can write one novel, but that the second attempt is the crucial one. This second attempt is a melancholy failure, all the more because of the evidences of real talent with which the book abounds. The story is unpleasant and improbable; the characters, with hardly a single exception, not even that of the heroine, are weak or foolish or vicious; and the tone of the whole is that of a writer who is not in any way bent on giving a picture of things as they are or as they might be, but of one who has suffered some wrong, real or imaginary, and wishes to hold up the real or imaginary wrongdoers to the indignation of the public. It has of late become the fashion to write novels the aim of which is to show in an odious light the persons who have not treated the writers as they wish to be treated; but though such stories may cause vexation to those at whom they are aimed, and may cause a certain amount of cynical amusement to those who happen to know the circumstances and the people described, they are in every way to be reprehended, and not least from the literary point of view. An absorbing antipathy, though it may give a sting to a lampoon or a philippic, does not help a writer in developing a plot naturally or in describing characters truthfully. Everybody likes a good story; and a novel is not the place for people to air their private piques and grievances, for the simple reason that the story is apt to be thereby spoiled. It is scarcely possible to read this book attentively without conjecturing that it is written to disparage some person or persons not unknown on the banks of the Tiber.

The tale begins with an account of the origin of the man who would probably be considered the hero, if there were one. He is the illegitimate son of a peasant girl of the Campagna and of a Roman noble. Vittorio, like his stepfather Marco (who, though a rejected lover of the betrayed girl, marries her afterwards), is an ardent democrat, zealous for the overthrow of all existing institutions. The writer is evidently unfamiliar with this class of persons in Italy, and also with that part of the Italian press which represents them, for we get no account of their ideas, sayings, or doings beyond a few mysterious utterances as to some great wrong which the poor suffer at the hands of the rich, and some great impending retribution which is to redress it. Vittorio, like the typical Italian of the circulating library, combines the extreme of manly vigour with an ineffable grace, sweetness, beauty, and charm. Plebeian by profession—for he was a gardener—and plebeian by birth on his mother's side, there is yet in him that indescribable something which betrays purer blood. He applies for the place of gardener to an Italian prince, and forthwith falls in love with the Donna Adelaide, daughter of the house, and she with him. They see one another first in the garden, at close of day, and "even in the dark she had not mistaken the son of a clod for the son of a

\* By the Tider. By the Author of "Signor Monaldini's Niece." London: W. H. Allen & Co. 1881.

gentleman." She soon afterwards makes a marriage of convenience with a man whom she despises, keeping the handsome gardener as her lover. It may be that such things happen in Italy and in other countries, but there is something unpardonably indelicate and repulsive in making an intrigue of this sort a leading feature in a book presumably intended for general circulation. She meets Vittorio in the garden the evening before she is married, and on her return from the honeymoon she and the gardener assure one another of their common hatred for Count Belvedere, the deceived husband.

After this wholesome preface we are introduced to the real heroine of the book, Valeria Ellsworth. She is an American woman, unmarried, and with no home ties, aged thirty-five, a Roman Catholic and of literary tastes, who, like most non-Italian Catholics, looks on a journey to Rome and an audience with the Pope in a very serious spirit. She crosses the Atlantic in the devoutest frame of mind and takes up her abode for a time at a Roman boarding-house. Looking at the mysteries of the Catholic faith in so reverent a spirit, she is accepted and treated with all consideration by the more serious minds of the clerical circles in Rome; but she has the misfortune to have forced upon her the acquaintance of a Miss Oromo, an elderly Catholic maiden lady living there, who is everybody's and nobody's friend, who minds everybody's business and her own best of all, and who has a finger in everybody's pie, spoiling all but her own. Valeria is dragged reluctantly into an intimacy with her which she afterwards finds reason bitterly to repent. She is not worldly enough to suit Miss Oromo's taste; she resents her importunities; she gives her to understand that she sees through her; and she ends by making an enemy of her. The rest of the book is an account of the troubles which Valeria gets into through her unfortunate habit of not getting on with people, ending in her being shut up on a false charge of insanity in a Roman asylum, where she dies at last. There is apparently no sufficient motive for anybody to push retaliation to this extreme. Valeria hires apartments overlooking the gardens of the wicked Countess, and learns more or less of the relations of this lady with the handsome gardener. But the Countess's character is represented to be notorious all over Rome, and the fact that one person the more, and that a foreigner, knows of her misdeeds does not account for her also having a hand in thus persecuting Valeria. Indeed one cannot very clearly see who is at the bottom of the plot, or why. A great number of people are all described as doing each of them something to get Valeria shut up; and yet she, being made out to be a truly admirable person and as sane as anybody else, cannot make friends who will stand by her and save her from the persecution and conspiracy under which she at last succumbs. The whole plot is absurd and preposterous. It may easily be that an innocent person should have enemies who want to get him or her out of the way; but that an American lady in Rome, where her own country people swarm, where there are a Consul and a Minister to appeal to, and English-speaking doctors to certify to her sanity, could be shut up and detained in a lunatic asylum maliciously and without cause is perfectly incredible.

But the way in which things happen without any reason in this book is altogether astonishing. While Valeria is thus making herself unpopular, the Countess is getting tired of Vittorio, and he, in his turn, is jealous of those who have superseded him in her vagrant affections. His jealousy is finally quieted through his being murdered one night in the garden by a sort of half spy, half bravo, in the service of the Countess. Meanwhile, Valeria is not only at war with many Americans and English in Rome, but is watched and dogged by the minions of the wicked Countess. And when she falls ill, as she soon does, of Roman fever, advantage is taken of her temporary delirium to make out that she is insane, whereupon she is entrapped into a madhouse. The description of the asylum and its inmates is excellent, and gives to the book whatever value it possesses. Valeria expostulates much, but does little for her release. She is soon allowed to go out, and can call on whom she pleases; but she does not use her comparative freedom to take any effectual steps to get discharged from the asylum, or to punish those who shut her up without cause. She acts all through—and here the absurdity of the book lies—as if she rather liked being thought mad and put under restraint. She is treated with the utmost kindness, and has every reasonable liberty allowed to her; liberty more than amply sufficient to have enabled her to obtain her release at any moment had she cared to do so. It is at any rate gratifying to think that the "Manicomio" on the Lungara is so well managed, and differs from certain other lunatic asylums in Italy, which have anything but an enviable reputation. By way of convincing one of the Sisters of Mercy who wait on the invalids that she is sound of mind, Valeria tells her one day that she weighs just three pounds. At last repeated attacks of fever break her constitution, and she dies friendless in the prison into which she has been inveigled.

The story is, on the whole, a very foolish and unpleasant one, but there are some good points in it. While Valeria is in the asylum, a lady comes to visit it, and takes Valeria to be also a visitor. After asking several questions, she wants to know if one of the patients, known as "the Duchess," who sits talking to a sane visitor, is out of her mind. Valeria represents the mad woman as sane and the sane woman as mad:—

The lady watched the two eagerly. "Yes, one sees that she is queer," she said, her eyes fixed on the unlucky visitor. "There is a certain wild light in the eyes of an insane person which can never be mistaken. And how oddly she pulls at her dress! Such a dress too! Does she ever change?"

"I cannot say, but I have no doubt that she does," Valeria replied, gravely. "But the other lady has a very pleasant manner, don't you think so?"

"She is exceedingly graceful and affable," the lady said, glancing at the Duchess.

"You perceive the difference in their eyes at once."

"Oh dear, yes."

It is to be regretted that a writer of ability and promise should have produced so disappointing a book. It may be added that there also occur in it the strangest blunders—some of which are made so often that the blame cannot charitably be thrown on the printer. "Forastieri" for "forestieri," "Eduardo" for "Edoardo," "Tironian" for (we suppose) "Tyrrhenian," "sala," in the sense of "salotto," are instances of the author's mastery of the Italian language and geography. We read, again, "the motto of Christianity should be in *estremo ratio*," and we are also told that "a Catholic never looks upon a religious as a stranger." But, on the whole, to do the book justice, the English is passable, though the Italian is not such as is spoken by natives of the country.

#### CHRISTMAS BOOKS.

v.

THE author of *John Halifax* has published (Macmillan and Co.) a volume of *Children's Poetry*, which has many very high qualities. The author can tell a story in verse with great spirit, and often with a pathos which is only too keen. If we had a fault to find with these poems, it would be that they too frequently touch the deepest emotions, and may make a very tender-hearted child unhappy in the reading. However, the sentimental as well as the personal sorrows of children are soon over; and, if a little boy or girl weeps over "The Pass of Brander," he or she may recover a happier tone in reading of "Dick Whittington," or "Monsieur et Mademoiselle," or "The Shaking of the Pear-Tree." To our mind "The Story of the Birkenhead" is the best poem in the volume; and, often as that noble tale of English courage and devotion has been told in verse, we doubt if it has ever been told so well. "Waterloo Day," again, manages to combine the true spirit of patriotism with due respect and liking for our "fair enemy, France." As a rule, the best poetry for children is that which is also best for grown-up people—the simple and more stirring pieces of the great masters. But the author of the volume before us has contributed several original poems which we would willingly see included in any collection of selected verse for children, and which would not seem out of place among ballads by Scott, Southey, and Wordsworth. "The Young Governess," however, is a piece which might not unprofitably have been omitted from a book for children.

*The Prince and the Pauper* (Chatto and Windus) is a singular production of Mr. Mark Twain's. He has written a boy's book before, *Tom Sawyer*, but not an historical romance for boys, with a moral purpose. Mr. Twain has read himself back, as far as possible, into the old English life of the sixteenth century, and he makes his characters talk in what is popularly supposed to be the style of that period. A little prince and a little street boy of intelligence and education change clothes and position; the prince sees a great deal of the rough side of the life of the people, and the poor boy introduces his natural mercifulness of character into the cruelties of old English criminal law. For example, he decides on the case of two people who have sold themselves to the devil, a crime which was surely not very commonly alleged in the time of Edward VI. Mr. Twain quotes Dr. Trumbull's *Blue Laws, True and False*, as an authority for the statement that a woman and her daughter, nine years old, were hanged in Huntingdon for selling their souls to the devil, and raising a storm by pulling off their stockings. He does not give the date, and the incident would have occurred more naturally at a later time, under the Scottish Solomon. The book is copiously and cleverly illustrated.

Mr. Sidney Lanier has edited the *Boy's Mabinogion* (Sampson Low and Co.) He says, with great truth, that the *Mabinogion* often seem more strange and foreign to us than "even Chinese or other antipodal tales," and that they have "a glamour and sleep-walking mystery" in them which we find in no other literature. This is probably the effect of the singular allusions to extraordinary circumstances, to us unknown, which are introduced as if they were perfectly familiar. For example, much of the story of "Twrch Trwyth" is common to Greeks and Finns; but where do we find such strange beasts in all fairyland as the stag of Redynvre and the owl of Owyn Oawlywyd? Some of the magical charm of the *Mabinogion* may escape the literary sense of boys; but the stories, the origin of so much poetry, must interest all who have a soul above cricket scores. Probably clever children who have not yet gone to school and learned to put away all but schoolboyish things will like the book better than their big brothers.

*The Knight and the Dwarf* (Chatto and Windus) is a modern fairy tale by Mr. Charles Mills. We cannot but say, in the matter of fairy tales, "the old are better"; but doubtless children will find something to amuse them in the fancies of Mr. Mills. Some of the illustrations deserve praise for firm execution and humorous invention.

Cassell's *Book of Sports* is an exhaustive encyclopædia. We have seen many bad pictures of cricket, but never aught like the coloured illustrations in the frontispiece. "The drive" represents a man in the act of depositing an easy catch in the hands of mid-off. The wicket-keeper looks as if he were performing some ritual ceremony. "The cut" is so hard to draw that we refrain from

criticizing the artist's attempt. The article on fencing is sensible. Cricket, too, is very well done; and the writer does well to impress young bowlers with the truth that "who breaks, pays." But bowlers, like poets, are born, not made by art and education. Indoor games and "recreative science" are also included in this deserving compilation.

*Fun and Fancies* (Shaw and Co.) seems a graceful and fanciful collection of modern fairy tales by Miss Grace Stebbing. The little girl with the eagles is drawn with spirit.

*Poetry for the Young* (Griffith and Farran) is meant for use in elementary schools. We see with some regret that many of the selected poems are from the books of third or fourth-rate songsters. The notes seem clear and just what children need.

Mr. Wallis Mackay shows a good deal of humour and grace in the illustrations to a little book of children's tales of the ordinary type, by L. Blennerhassett Poirez (Remington and Co.)

The Christmas Number of the *Monthly Packet* (Walter Smith).—The proverb on which these stories are written is the old one of "manners maketh men"; but we are bound to say some of the writers appear to us to have shot rather wide of the mark. Miss Younge has surpassed herself this year, in a "Review of Nieces," in the number and perplexingness of a family. Conscious of this, she has added a much-needed genealogical table; but, in spite of the table and a certain native aptitude for genealogy, we constantly find ourselves hopelessly confused. The *motif* of her story is a simple one. A gentleman and his sister wish to take out with them to a colony, where the former has obtained a command, a niece to act as young lady of the house. The question in consideration is, Who, and why? A combination of circumstances, which many people would regard as most unfortunate, leads four branches of the Fulford family to take up their residence at the same seaside place during one summer; and this affords a grand opportunity of inquiring into the characters of the girls. It is needless to say that hardly any one is called by her baptismal name. Of the two Margarets, one is spoken of as "Pica," and the other by the extraordinarily hideous transformation of Metelill. What is the use of giving a person a name only to call her systematically by another?

*The Ladies' Treasury* (edited by Mrs. Warren Beurow).—The most interesting papers in *The Ladies' Treasury* are those devoted to fashion. It is charming to know that "the newest caprice in bodice bouquets is a small white dove holding in its bill a bunch of violets," or that "cats have now succeeded pigs in fancy jewellery." The letterpress retelling the "On dits and facts of the month" is not always strictly accurate, as, for instance, where it speaks of "the Hon. W. O. Stanley, brother of the late Dean Stanley," or spells "Glyn" with two "n's." Then there are numerous stories and poems, among them some exhilarating verses by one Miss Annie James, called "Flirting on the Ice." Altogether the largest families may find something to please each member.

*From Crecy to Assaye* (H. R. Clinton, M.A. Warne).—Mr. Clinton has spared no pains to make his book interesting to boys, and in order that as far as possible they shall understand what they are reading, he has added maps and plans of the battle-fields. He has succeeded well in his task, and gathers besides boys may be grateful to him. We cannot, however, quite go with him when he describes William of Orange as "stouthearted but luckless." We should have thought that the King's good fortune was rather beyond his deserts. He likewise speaks of Cromwell's "misdirected energy." Now people may think that, socially and religiously, Cromwell was mistaken; but it is seldom that his military wisdom, to which Mr. Clinton refers, is disputed. Nor can we congratulate him on the group of portraits which form his frontispiece. Marlborough no longer looks the handsomest man of his day, but a very commonplace person indeed. Wellington is absolutely unrecognizable; while, if the Black Prince's reputation for beauty rests on no stronger basis than this picture, the fourteenth-century chroniclers must have been easily satisfied.

*Without a Reference* (Brenda, author of "Froggy's Little Brother." Hatchards).—Brenda always knows how to be pathetic without being either sentimental or moralizing, and consequently her stories are invariably pleasing and wholesome. *Without a Reference* is an episode in the life of a gentleman who is turned out of the army for drinking, and, after many years of misfortune, turns up as a starving musician in search of engagements to play at parties. At his first and only appearance he meets some friends of his youth, who recognize him and set him on his feet again. We like the book so much that we think it is a pity Brenda should kill off a young man, p. 11, only to revive him in p. 21; that she should spell Mr. Marzial's name with an "s" instead of a "z," and that she should condescend to use such a word as "reliability."

*Beyond the Himalayas* (John Geddies, Nelson).—The corner of the world explored by Mr. Bob Brown and his friends can hardly be described with strictness either as "beyond the Himalayas" or as "the Wilds of Tibet," for it apparently included the frontiers of Burma, Tibet, and China. The travellers start from Assam, cross the Patkoi Mountains, leaving the Himalayas behind them at right angles, and make for the river Mokong, which rises somewhere in Tibet, and falls into the China Sea. The descriptions are most interesting.

*Under the Shield* (M. E. Winchester. Seeley, Jackson, and Halliday).—Miss Winchester's book cannot be said to be an improvement upon her former ones. It is very lengthy, very minute, and very dull. It contains many pious observations; but the spectacle of a whole family quarrelling over one little boy is not desirable for a child to dwell upon. A reform in the morbid spirit of modern children's books is much needed.

We have more than the usual number of paper books for children, of which *A Day in a Child's Life* (music by Myles Foster. Illustrated by Miss Greenaway. Routledge) is the prettiest. But why are the people so pink? First we have a fair one with golden locks, in bed (furniture by Messrs. Morris and Co.); then come songs, daffodils, sunflowers, jolly children running to school, stiff old gardens, tiger lilies, tulips, and similar creatures of Miss Greenaway's fairy fancy.

K. G. also signs a page in *Little Tiny's Book of the Country* (Routledge).

*At Home* is very nicely decorated by Mr. Sowerby and Mr. T. Crane (Marcus Ward). The perspective and atmosphere of some drawings of interiors are admirable. Master Tom, as "a seal at the Zoo," is very humorous. Altogether, this is a capital gift-book.

The pictures in *May Blossom* (Miss Wingrave. Warne and Co.) are by H. H. Emmerson, and are very clever, though rather too rich in colour.

*Cat's Crawl* (Rhymes by E. Willett. Illustrated by C. Kendrick. Strahan and Co.) is in much the same style, but less original.

The *Diaries* of Messrs. Letts and Co. are all that the most strenuous diarist can require. Papy would have revelled in them.

#### FRENCH CHRISTMAS BOOKS.

**M** JULES VERNE'S *La Jangada* (Hetzel), with its spirited illustrations by Benett, is naturally one of the most attractive of this year's French gift-books. There is plenty of adventure and plenty of description in it, and there is a special interest running through the book due to a device which proves that M. Verne's inventive powers are as fresh as ever. The book opens with four lines of a most hopeless-looking cipher, the immense importance of which is developed as the chapters follow each other. The reader follows with an almost painful interest the attempts towards the end to decipher the document according to every known and unknown rule, and the final discovery of the clue is admirably worked up to. The sub-title of the book, "Huit cents lieues sur l'Amazono," holds out a promise which is amply fulfilled of the kind of description in which M. Verne excels; but it is perhaps to be feared or hoped that the instructive parts of the work may be skipped by M. Verne's youthful readers in their desire to get on with the story. What the *Jangada* itself is, of what precise nature are its adventures, and why the deciphering of the mysterious document is so important, we had better leave M. Verne's numerous public to find out for itself.

M. Lucien Biart, from whom we have learnt to expect a book of adventure at this season as regularly as we expect one from M. Verne, has in *Le secret de José* (Hetzel) taken up afresh the threads of the capital story which he wrote two years ago, and which contained the surprising adventures of the unhappy M. Pinson, who, meaning to say good-bye to his friend Boisjoli at Liverpool, got carried out into mid-ocean, and, after various mishaps, landed far away alike from Boisjoli and from his beloved Boulevards. In the present volume we find him on the banks of the "Papaloapam, le plus considérable des cours d'eau qui baignent la côte ouest de la province de Vera-Cruz." He is still accompanied by Viñ-Argent, the vagabond little boy whom he picked up in London; and he is on his way to the estate, called La Héronnière, of Don Ambrosio Lerdo, for whom he has undertaken to do certain important engineering work. At La Héronnière we find the beautiful Amalia, daughter of Don Ambrosio, and her cousin Pablo, who is engaged to her; and on a neighbouring estate we are introduced to Don Luis Avila, an impoverished gentleman, who used in more youthful days to be on the best terms with the Héronnière people, and especially with Amalia. The reader soon learns to be suspicious of Pablo and to trust in Luis, and his impression is confirmed by the opinion of the mysterious José, a former steward of Don Ambrosio's, who is regarded as a magician by the natives, and who spends much of his time in doing rude but efficient justice in various cases by means of a secret source of wealth which he has at command. This is, in fact, the "secret de José"—a secret which is well kept up to the end, and revealed at last in an appropriately dramatic fashion. We have, of course, before the end is arrived at, all kinds of exciting adventures, in which M. Pinson finds opportunities of proving that, although he has not learned to ride and shoot like the people amongst whom he is thrown, he is yet a tall man of his hands; and we have also an interesting love story disturbed by fitting complications and terrors. On the whole, *Le secret de José* may be confidently recommended.

The two volumes of the *Journal de la jeunesse* (Hachette) for 1881 contain as usual much well-assorted and various matter, including some capital articles on games by M. Frédéric Dillaye, and some serial stories which it may be more convenient to notice in their republished forms.

M. André Laurie, in his book *La vie de collège en Angleterre* (Hetzel)—which seems to be one of a series that is to include school life in all countries—has shown, on the whole, a curiously accurate knowledge. We are not personally acquainted with any school where quite so much liberty is allowed in—to take an instance—the matter of sitting up at night as was allowed at Mr. Newton's school; but this, and other similar things—which seem to be the result of a curious confusion between public schools, private schools, and private tutors' establishments—are of comparatively small importance. M. Laurie's book, which is throughout

lively, and in which the characters are by no means ill drawn, shows clearly, but not obtrusively, his strong disapproval of the Lycée system, and his strong desire to see it more than tempered with many excellent things to be found in the English school system. Amongst the English school institutions which he does not find excellent is that of fagging, and he represents an impossible enough conflict being waged by Laurent against all the traditions of the school, and resulting in an end being put for ever to fagging at Mr. Newton's by Laurent's dogged resistance. Perhaps the funniest mixture of ignorance and knowledge in the book is to be found in the account of the fight between Laurent and the appropriately named Bully, a fight which Laurent wins, without remonstrance, by adopting the nigger dodge, taught him carefully by a French sailor, of running his head into his opponent's stomach. Mistakes of this kind, however, do not make the book less amusing or interesting. The illustrations, by M. P. Philippoteaux, are particularly good.

M. J. Girardin's *Maman* (Hachette) is one of the books just referred to as having run through the *Journal de la jeunesse*. The story is pretty and wholesome, and is, it need hardly be said, made the more attractive by the style. M. Tofani's illustrations are in complete sympathy with the author's pleasant matter and manner.

In the *Voyages au Théâtre* (D'Ennery et Jules Verne. Hetzel), we have collected, with spirited illustrations by MM. Benett and Meyer, those stirring dramas *Le tour du monde en 80 jours*, *Les enfants du capitaine Grant*, and *Michel Strogoff*. The idea of so collecting them was a good one, and has been excellently carried out.

Mme. de Witt (née Guizot), in *Lutin et démon* (Hachette), gives us a third series of "Pictures from History," which are well told, and well illustrated by MM. Zier, Pranshnikoff, and Sandow. We must, however, protest against so tragic a story as the first one being included in the book.

M. Lorédan Larchey has prepared with much pains an edition "rapproché du Français moderne" of the *Histoire du gentil seigneur de Bayard, composée par le loyal serviteur* (Hachette), which appears in the shape of a fat volume excellently printed and beautifully and profusely illustrated. M. Larchey, as we learn from his introduction, was fully conscious of the difficulties of a task which he did not undertake without hesitation:—"L'embarras est double: si vous ne francisez point, vous risquez d'être peu intelligible; si vous francisez trop, vous enlevez tout caractère à votre œuvre. Ou vous êtes trop complet, ou vous ne l'êtes pas assez. Il faut simer notre ancienne langue pour comprendre les délicatesses d'une telle épuratoin, qui a nécessité de douloureux sacrifices." M. Larchey has, however, manfully overcome all difficulties, and it would not be easy to find a more suitable gift-book than his edition of "Le loyal serviteur."

Another handsome and eminently readable book, of which the printing and illustration alike deserve the highest praise, is *Le Maroc* (Hachette), translated by M. Henri Belle, with the original author's special permission, from the Italian of Signor de Amicis, of whose lively style we have had occasion to speak with reference to former works of his.

In *Les exploits des jeunes Boërs, les chasseurs de girafes* (par Mayno Reid; adaptation par S. Blandy. Hetzel) we gladly meet an old friend in a new dress. Von Bloom and his sons and their adventures are as interesting as ever in their adapted form; and M. Riou has supplied the book with illustrations which are full of dash and spirit.

In *Nous deux*, a handsome little quarto, with letterpress (J. Girardin. Illustrations de J. G. Sowerby et H. H. Emerson. Hachette), French children have an opportunity of enjoying the style of illustration to which Mr. Caldecott and Miss Greenwood have accustomed their English contemporaries.

Of two volumes of the *Bibliothèque Rose* which we may now notice, *Le manoir d'Ydun* (Mlle de Martignat. Hachette), which is intended for older children than *Chez grand-mère* (Mlle Julie Gouraud. Hachette), is perhaps the better. Not much can be said for the illustrations of either, their chief object being apparently to exhibit little girls in all the finery of the fashion books. A minute philosopher might draw some useful morals from the comparison of the small French girl as represented physically in these woodcuts and the adult Frenchwoman as represented morally in French novels *pas-sim*.

*Histoire d'un ruisseau* (Elisée Reclus. Dessins par L. Benett).—M. Elisée Reclus has this year given us the history of a stream, as he has previously given us the history of a mountain. We begin with *La source* and end with *Le cycle des eaux*; and it is not too much to say that there is hardly a dull line in the two hundred and odd pages which make up the book, for which M. Benett has supplied good and fitting illustrations. We may cite as a good instance of the book's attractiveness the chapter devoted to *La Pêche*.

*Bibliothèque des merveilles—Les métamorphoses des insectes* (Maurice Girard. 5<sup>me</sup> édition, revue et augmentée par l'auteur. Hachette).—M. Girard, who was formerly President of the Entomological Society of France, has prepared a fifth edition of his "Metamorphoses of Insects" for the *Bibliothèque des merveilles*. Cheapness is of the essence of this library, and therefore M. Girard has confined himself for the most part to retouching the fourth edition. Two important additions, however, have been necessary, "L'un est la *Doryphore des pommes de terre*, actuellement en Europe, et qui est une menace incessante pour notre pays; l'autre, de trop ruineuse actualité, est le *Phylloxera de la vigne*,

dont l'étude était encore très-incomplète en 1874 lors de la quatrième édition de ce livre."

*Bibliothèque des merveilles—Le sel* (Eugène Lefebvre. Hachette). To the same library belongs M. Lefebvre's *Le sel*, a book which accomplishes the difficult task of conveying instruction in a pleasant way.

# NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

## THE SATURDAY REVIEW.

Price 6d.

CONTENTS OF No. 1,365, DECEMBER 24, 1881:

Egypt.	The Ledger Franchise.
Lord Hartington in Lancashire.	The Turkish Debt.
The State of Ireland.	Mr. Blaine's Despatch.
M. Gambetta and the Country.	The London Water Companies.
Railway Companies and Railway Accidents.

	French Christmas Books.

London: Published at 38 SOUTHAMPTON STREET, STRAND, W.C.

## ADVERTISEMENTS.

DORIS GREAT WORKS, "CHRIST LEAVING the PILATE PORTRAIT," CHRISTEN PHILIP JERUSALEM, and "MORIS BEFORE PHILADELPHIA" each 15 by 22 feet, with "Dream of Pilate's Wife," "Christian Martyrs," &c. at the DORIS GALLERY, 38 New Bond Street, Daily, Ten to Six, 1s.

THE EUROPEAN (late New) GALLERIES, 103 New Bond Street, sixteen doors from Oxford Street. Exhibition of FINE ART and DECORATIVE ART. Admission free this week. T. J. GULLICK, Director.

NEWTON HALL, Fleur-de-lis Court, FETTER LANE, E.C. POSTIVIST SOCIETY.—The ANNUAL ADDRESS will be given on Sunday, January 1, at Four P.M. precisely, by Mr. FREDERICK HARRISON. SUNDAY LECTURES will be continued until further notice. On Sundays, January 8, 15, 22, 29, Professor HENSLY, at Eight P.M. A CLASS is being formed in the Elements and History of GEOMETRY, on Wednesdays, at Eight P.M. Apply to the SECRETARY. All Lectures and Classes free.

UNIVERSITY of LONDON.—The following are the Dates at which the several EXAMINATIONS in the UNIVERSITY of LONDON for the Year 1882 will commence:

Matriculation	Monday, January 9, and Monday, June 19.
Bachelor of Arts	Intermediate, Monday, July 17.
B.A. Monday, October 25.	
Master of Arts	Branch I, Monday, June 5; Branch II, Monday, June 12; Branch III, Monday, June 19.
Doctor of Literature	Intermediate, Monday, June 5.
D.Lit., Tuesday, December 6.	
Scriptural Examinations	Tuesday, November 24.
Bachelor of Science	Intermediate, Monday, July 17.
B.Sc., Monday, October 16.	
Doctor of Science	Within the first Twenty-one days of June.
Bachelor of Laws	Intermediate, Monday, January 2.
B.Lit.,	
Doctor of Laws	Thursday, January 12.
Bachelor of Medicine	Preliminary, November, Monday, July 17.
Intermediate, Monday, July 17.	
B.M., Monday, November 6.	
Bachelor of Surgery	Tuesday, December 5.
Master of Surgery	Monday, December 5.
Doctor of Medicine	Monday, December 5.
Subjects available to Public	Monday, December 11.
Health	
Bachelor of Music	Intermediate, Monday, December 11.
B.Mus., Monday, December 18.	
Doctor of Music	Intermediate, Monday, December 11.
D.Mus., Monday, December 18.	

The Regulations relating to the above Examinations and Degrees may be obtained on application to "The Registrar of the University of London, Burlington Gardens, London, W."

December 16, 1881. ARTHUR MILMAN, M.A., Registrar. BATH COLLEGE, BATH.—The NEXT TERM will commence on Wednesday January 25, 1882. Head-Master: T. W. DUNN, Esq., M.A., late Fellow and Assistant Tutor, St. Peter's College, Cambridge, and for ten years a Master of Clifton College.

ROYAL AGRICULTURAL COLLEGE, GIRENCESTER. Established by Royal Charter, 1850.

FOR THE SCIENCE AND PRACTICE OF AGRICULTURE. For intending Land Owners and Occupiers, Land Agents, Surveyors, Colonists, &c. THE COLLEGE FARM, for the practical instruction of the Students, surrounds the College, and is a mixed Farm of about 500 Acres.

President.—His Grace the Duke of MARLBOROUGH, K.G. Committee of Management. The Right Hon. the Earl of DUCIE, Chairman. The Right Hon. the Earl BATHURST. The Right Hon. Sir MICHAEL E. HICKS-BEACH, Bart., M.P. Lieut.-Col. R. NIGEL F. KINGSCOTE, C.B., M.P. GEORGE T. J. SOTHERON-ESTCOURT, Esq., M.P. AMBROSE L. GODDARD, Esq. EDWARD BOWLY, Esq. WILLIAM JOHN EDMONDS, Esq. Major T. W. CHESTER MASTER, M.P.

For Prospects of COLLEGE and FARM, List of Scholarships, Prizes, Diplomas, &c. apply to the PRINCIPAL. NEXT SESSION begins January 31.

BRIGHTON COLLEGE. Principal—Rev. T. HAYES BELCHER, M.A., Queen's College, Oxford.

Vice-Principal—Rev. J. NEWTON, M.A., St. John's College, Cambridge. A special Army Class, in which preparation is made for Sandhurst, Woolwich, Cooper's Hill, and Indian Civil Service, has been in active work for some time. The course of instruction enables boys to go up for their examination direct from the College. The NEXT TERM will commence on Friday, January 27.

F. W. MADDEN, M.R.A.S., Secretary.

# GROSVENOR GALLERY.

## WINTER EXHIBITION.

THE  
WINTER EXHIBITION

AT THE

# GROSVENOR GALLERY

WILL OPEN

ON DECEMBER 31 NEXT,

WITH A

COLLECTION OF WATER-COLOUR  
DRAWINGS

AND A

COMPLETE COLLECTION  
OF

THE WORKS OF

G. F. WATTS, R.A.

FORMING THE FIRST OF A  
SERIES OF

ANNUAL WINTER EXHIBITIONS ILLUSTRATING  
THE WORKS OF THE MOST

EMINENT LIVING PAINTERS.

### D O V E R C O L L E G E.

President—Earl GRANVILLE, K.G.

Next Term will commence on January 10. Board, 240 £s. Tuition from 15 to 16 Guineas. For particulars apply to the Rev. W. BELL, M.A., the Head Master, or W. KNOCK, Esq., the Honorary Secretary.

**SOMERSETSHIRE COLLEGE, BATH.**—The College is divided into Classical and Modern sides. BOARDERS are taken in the Senior Department by the Head-Master; in the Junior Department by the Rev. PHILIP CAJOR, M.A. Special attention is given to Delicate or Backward Boys. For Prospectus, List of Honours, &c., apply to the Head-Master, T. M. BROMLEY, M.A.

### ISLE OF WIGHT COLLEGE, RYDE.

THREE ENTRANCE SCHOLARSHIPS.

The NEXT TERM begins January 10th.

For particulars apply to the HEAD-MASTER.

### KELLY COLLEGE, TAVISTOCK, South Devon.

Chairman of Trustees: The Right Hon. the Earl of DEVON.

Head-Master: ROBERT W. TAYLOR, M.A. (formerly Fellow of St. John's College, Cambridge, 17th Wrangler and 5th Classic 1860).

BOYS prepared for the Universities, the Army, Navy, and Civil Service Examinations, and the Professions. Large airy buildings; healthy and bracing position, facing Dartmoor; spacious playground; home comforts. Inclusive Fees for Boarders, £24 per Term. NEXT TERM commences January 30, 1882. For Prospectus, &c., apply to the HEAD-MASTER.

### TRINITY COLLEGE SCHOOL, STRATFORD-ON-AVON.

Founded by the Rev. J. D. COLLIS, D.D. The Warden, RICHARD F. CURRY, M.A., assisted by three Masters, teaches Classical and Modern Languages. Preparation for the Universities, and all competitive Examinations. Special Classes for the Army Examinations. Great attention paid to Modern Languages. Junior Department for Young Boys. Large Playing Fields, Gymnasium, Five Courts, &c. &c. Terms 50 and 60 Guineas per annum. Apply to the WARDEN.

### ST. ANDREW'S COLLEGE, CHARDSTOCK, Dorset.

Terms moderate and inclusive. NEXT TERM begins January 27, 1882. Apply to School SECRETARY.

### WHARFE-DALE SCHOOL, near BEN-RHYDDING, Leeds.

A PUBLIC SCHOOL for SONS of GENTLEMEN. Preparation for Scholarship and other Examinations. Modern Languages. Natural Sciences. Splendid site. References to Noblemen and Church Dignitaries, &c. Apply to Rev. T. GRANVILLE HUTT, M.A., Sedburgh School, Yorkshire. Entrance Scholarship Examination in January.

### OAKHAM.—ARCHDEACON JOHNSON'S SCHOOL.

Head-Master—Rev. E. V. LODGE, M.A., Balliol College, Oxford.

Boys are eligible to Four Leaving Exhibitions of £20 per annum from the School; Sixteen Johnson Exhibitions at Cambridge; Three or more School Exhibitions from £10 to £25; Three Prizes of £10. New Class-rooms have lately been built, and a new House opened last Term. NEXT TERM begins January 16.

### HYERES, South of FRANCE.—AN OXFORD M.A., and

Barrister-at-Law (Married), an experienced and successful Tutor, residing in his own Villa, which is most beautifully and healthily situated, receives SIX PUPILS in delicate French, English, and Italian. Special advantages for French conversation. Address, W. HEBLEY CHATEL, Les Bains, Hyeres (Var), France.

### NAVAL CADETSHIPS, PUBLIC SCHOOLS, &c.

"Eastman's" H.N. ACADEMY,

BURGOYNE HOUSE, SOUTHSEA.

Principal, since 1860, G. EASTCOTT SPICKERNELL.

Burgoynes House is situated close to and directly facing the Sea. Pupils enjoy good BOATING and BATHING, and are all taught to SWIM. Pupils received from Nine years of age and upwards. For every information, and results of Examinations, address the PRINCIPAL, as above.

### REV. R. H. QUICK, formerly Assistant-Master at Harrow,

takes as Boarders YOUNG BOYS preparing for the Public Schools. Address, Hill House, Gulliford.

### A CHARMING and unusually comfortable HOME, in a

beautiful and healthy part of the country, one hour from London, is offered to a limited number of the SONS of GENTLEMEN, under Fifteen, by an EXPERIENCED TUTOR, an M.A. of Oxford, in Classical Honours, who devotes himself entirely to his Pupils, and trains them for the Public Schools, &c. Prospectus, with list of distinguished references, will be sent on application, by letter only, to OXFORD, care of Willing's Newspaper Advertisement Offices, 333 Strand.

### OVERSLADE PREPARATORY SCHOOL, near RUGBY.

The Rev. G. F. WRIGHT, M.A., late Fellow of C.C.C. Camb., formerly Assistant-Master at Shrewsbury School and at Wellington College, prepares BOYS for the Public Schools.

### HIGH CROFT, GODALMING.

Mr. ALGERNON STEDMAN, M.A., Oxon., receives the SONS of GENTLEMEN, between Eight and Fifteen, to prepare for Entrance and Scholarships at Public Schools, &c. The house is on a fine and healthy site, with good playground. The sanitary and domestic arrangements are perfect.

### AMESBURY HOUSE, PAGE HEATH, BICKLEY, Kent.

Rev. EDMUND FOWLE, Author of a very successful Series of Latin and Greek School-books, receives THIRTEEN BOYS under the age of Fifteen, to prepare for the Public Schools.

### INDIAN BOYS.—Rev. R. A. CAYLEY desires to make a

HOME for Two or Three (brothers preferred), aged from Eleven to Sixteen, and to send to Public School with his own Sons. For terms, &c., apply Reampton Rectory, Lincoln.

### UNIVERSITY of LONDON.—The office of ASSISTANT

REGISTRAR having become vacant by the resignation of Mr. MOWBRAY, the Senate desire to appoint a Successor possessing special scientific qualifications, either with or without a Medical Degree.

The salary attached to the office is £500 per annum. In common with the other officers of the University, the Assistant Registrar is subject to annual re-election.

His whole time must be at the disposal of the University. He must be prepared to enter upon his duties on May 1 next.

Further information may be obtained by application to the REGISTRAR.

Candidates are desired to send in their names to the REGISTRAR, with a statement of their age (which must not be less than Twenty-five nor more than Forty-five years), previous career and qualifications, together with such testimonials as they may think desirable, on or before Tuesday, January 31. It is particularly requested by the Senate that no personal application be made to its members individually.

By order of the Senate,

ARTHUR MILMAN, Registrar.

University of London, Burlington Gardens, W.  
December 20, 1881.

A RESPECTABLE, middle-aged MAN would be glad of EMPLOYMENT of any kind; is a fair scholar, and has held appointments of great responsibility. First-class recommendations. Moderate remuneration. Address, J. G., 2 Granby Street, Hampstead Road, N.W.

### BRIGHTON.—BEDFORD HOTEL.—Facing Sea and

Esplanade. Near the West Pier. Central and quiet. Long established. Suites of Rooms. Spacious Coffee-room for Ladies and Gentlemen. Sea-Water service in the Hotel. BENJN. BULL, Manager.

### SPECTACLES versus BLINDNESS.

ONE-FOURTH of those suffering from blindness can trace their

calamity to the use of common spectacles or lenses imperfectly adapted to the sight. Mr. HENRY LAURANCE, F.R.S., Oculist Optician, PERSONALLY adapts his Improved Spectacles at his residence, 3 Kingsleigh Gardens, Euston Square, London, daily (Saturdays excepted) ten to four. BEN JULLIEN BENEDICT writes: "I have tried the principal oculists in London without success, but your spectacles suit me admirably. The clearest of your glasses, as compared with others, is really surprising." DR. BIRD, Chairman of the Surgeon-Major, W.E.M., writes: "I could not have believed it possible that my sight could have been so much improved and relieved at my age, 52. I can now read the smallest print, although suffering from cataracts; the right eye, which was blind for months, is now clear. Consulting Physician, Westminster Hospital; Ven. Archdeacon Palmer, Oculist, East-Gate, Macclesfield; Brentwood, the Rev. Mother Abbe, St. Mary's Abbey, London, and hundreds of others. Mr. Laurence's Pamphlet, 'Spectacles, their Use and Abuse,' post free.

himself professedly bases his calculations) that more than a thousand persons attended the additional Church services already referred to, while not more than 233 attended extra services in Nonconformist chapels; and that, in yet further addition, a service attended by five or six hundred persons was held by Canon WILBERFORCE in an unconsecrated building. These figures may or may not be important in themselves, but they are decisive as to the trustworthiness of Mr. MIALLE's method of calculation.

There is, however, no need to pitch the pipe so low as this. Mr. MIALLE has unconsciously given the right note in saying that "he himself is a Churchman in the eye of the law"—he might have added in the eye of the Church, too, politically speaking—and the Bishop of WINCHESTER has enforced it, if not so strongly as he might have done, in a letter to the *Times*. The Church of England does not rest her claim on an accidental and constantly varying numeration of heads. There is little doubt—the incontestable fact of the detestation in which the political Dissenters hold the idea of a religious Census proves it—that this numeration would be in her favour, but the madness of majorities has not yet infected her. As Mr. MIALLE says very excellently, he himself and everybody else is a Churchman in the eye of the law, whether it pleases him or not to disregard a law which has no penal sanction. All the advantages of the Church are open to him and to any one when he chooses to avail himself of them; and it is in the fact that they are so open that the nationality of the Church consists. The Anglican communion knows nothing, in the strict sense, of the sectarian conditions of what is called "Church membership." Even the Rubrics content themselves with enjoining—again without penal means of enforcement—attendance thrice a year at a particular service. The fierce competition for ticketed and numbered "Church members" has been noted by a tolerably dispassionate observer, M. RENAN, as especially characteristic of the Dissenting sects of England and America. It is not shared by the Church. It is open, of course, to any one to contend that, from the strictly religious, and still more from the strictly ecclesiastical, point of view, the Church of England has pushed this lofty conception of universality and catholicity too far; but that is not now a matter of concern. The fact is that, legally, politically, and historically, the conception is there. The spiritual consolations of the Church are open to all, the material aid which her ministers dispense is open to all likewise; and, as everybody acquainted with parochial work knows, this latter, at least, is most impartially accepted by all. In political theory the Church knows nothing of sects; and the very ministers of the recalcitrant denominations are in her eyes Churchmen—whether good or bad Churchmen is another matter. No process of numbering and ticketing could, therefore, be entered upon by her without forfeiting the claim which, politically speaking, is her strongest and most unassailable. It is scarcely a paradox to say that, if a compact body of Churchmen—not, as at present, merging indefinitely into another body which is composed of individuals sometimes conforming and sometimes nonconforming, but ruled off and circumscribed—could be proved to be a numerical majority, the political position of the Church would be weaker than it is now. A step would have been made in the process of degradation from an institution coextensive with the State—though containing, like the State, bad subjects, more or less in number—to a voluntary association, powerful or feeble as the case might be, but separate and possibly hostile. To put the matter briefly—it is the business of the Church to make as many Englishmen as possible Churchmen in fact as well as in theory, but it is no business of hers to encourage the notion that she rests her claims on the number of her ostensible adherents.

#### INDUSTRIAL SCHOOLS AND THE LONDON SCHOOL BOARD.

SIR WILLIAM HARCOURT must wish by this time that he had put off writing to Mrs. SURRE until he had received the report of the Public Prosecutor. Had he done so his letter would probably have been a good deal shorter and a good deal less gushing. The case against the majority and in favour of the minority of the London School Board will appear to many people to be greatly weakened by the Public Prosecutor's decision. If a tenth part of the harrowing stories told by the boys at the St.

Paul's Industrial School had been true, there would have been abundant reason for a criminal prosecution. That the evidence has proved, on examination by experts, not to supply *prima facie* ground for taking proceedings which is all that the Public Prosecutor looks for, shows that Mrs. SURRE must have been taken in. It is easy to imagine the way in which she was misled. The report of the Home Office Inspector and Mr. SCRUTTON's own admissions show that the school was not properly managed. Mrs. SURRE was perhaps a little carried away by her natural kindness, and by the reflection that this discovery was likely to bring discredit on a party in the School Board to whose policy she was honestly opposed. In this temper she was not likely to scrutinize too closely the narratives submitted to her, and unfortunately these narratives were of a kind which eminently required a close scrutiny. The testimony of boys against a master is never very trustworthy, and a great deal of the evidence actually laid before Mrs. SURRE related to cruelties alleged to have been committed to boys who were dead or had left the school. But, though it was not good enough for the Public Prosecutor, it was good enough for Mrs. SURRE. She was shocked at what she saw, more shocked at what she heard, and most of all shocked at what she inferred. In cases like this the road to conviction is not a long one when once the start has been made. The incredulity with which she was met by the majority of the School Board naturally disposed her to welcome any additional evidence that things had been as she thought.

If the School Board had been wise, no harm would have resulted from Mrs. SURRE's error. The Board would have done at once what it was compelled to do in the end, and have insisted on an immediate inquiry being held, either by itself or by the HOME SECRETARY. Unfortunately the majority of the Board seemed more anxious to show that the condition of the school was no business of theirs than to ascertain what the condition of the school really was. They wasted a great deal of breath in proving that the duty of inspecting industrial schools belongs to the HOME SECRETARY, and not to the School Board; and, having done this, they thought they had made good their case. They forgot that, though they were not bound to make inquiries into the character of an industrial school before sending children to be brought up in it, they were bound, when specific charges were brought against a school at which they were maintaining children, to ascertain, by themselves or by some one else, whether these charges were true or false. This obligation springs naturally out of the fact that the children in question are maintained at the cost of the ratepayers; and it is quite certain that the ratepayers of London would not wish their money to go to the support of an industrial school such as St. Paul's was affirmed to be. It has been contended, indeed, by some of the members that the School Board owes no more to the children whom it has had sent to an industrial school than a private person who sets the law in motion for the same object. Even in the latter case, an obligation to make inquiry into the truth of charges so serious as those brought against the St. Paul's School would arise if the means for making it or getting it made were within reach; and where the persons who have had the children sent to the industrial school are a public body administering public money, the duty is very much more obvious. If the majority of the London School Board had remembered that, though they were in no way responsible for the state of the school, they were responsible for any children being in the school, they would have seen that, much as they might disapprove of Mrs. SURRE's general policy on educational matters or of her demeanour towards the Industrial Schools Committee, she was in this instance completely within her right. Here were specific charges of cruelty and mismanagement brought against a school at which children were maintained by the London ratepayers, and it was consequently the duty of the School Board, as the representative of the ratepayers in educational matters, to ascertain, either by itself or by some better-qualified authority, whether there was any foundation for these charges. Had it done so, it would now have occupied a very much better place in public opinion. It is a piece of great good fortune for the Board that the charges have not furnished the Public Prosecutor with the material necessary for instituting proceedings. The indisposition of the majority to have the circumstances thoroughly gone

into would have looked very much worse, though it would not really have been worse, if the Public Prosecutor had been prepared with a long and serious indictment against the Superintendent of the School.

The announcement that the whole question is to be referred to a Royal Commission is satisfactory. It is plain that the present system of inspection is quite inadequate as a means of preventing abuses, while in an industrial school abuses are exceedingly apt to arise. These schools require a very much stricter discipline than is needed in ordinary schools, and at the same time the safeguards against any abuse of discipline which exist in ordinary schools are wanting in industrial schools. The children are for the most part of less tractable dispositions than ordinary children, and, in order to deal with them, it is necessary at times to have recourse to sharper punishments. But, as the children do not go home at night, they have no opportunity of complaining to their parents, and consequently no means of defending themselves against any inclination to tyranny that there may be in the teachers. Once inside the school, a child is virtually at the mercy of those who have the control of it. Nor would things be any better if the means of communication between children and parents were increased. The disposition to falsehood, which is natural to children who think that their liberty depends on the framing of a clever lie, would be nourished by more frequent intercourse with those whom they might fairly hope to enlist on their side; and in trying not to discourage just complaints, we should simply be encouraging fictitious complaints. The only safeguards in which any confidence can be placed are good management and strict inspection. The faulty condition of the St. Paul's Industrial School could hardly have escaped the notice of an efficient board of managers meeting at frequent intervals. As it was, it had only to escape the notice of a single manager, and there is always very much more chance that abuses will be passed over by one man, whose measure may have been accurately taken by the superintendent of the school, than by a body of men. Still it is quite possible to deceive even a body of men; and for this reason it is essential that the managers should have their conclusions gone over and tested by careful inspection. The staff at present maintained by the Home Office is altogether inadequate for this duty. An Inspector and an Assistant-Inspector cannot pay that attention to each school which is needed if the managers are to be kept up to their work. Whether this inspection should be entrusted to the central or to the local authorities, and, if to the central authorities, whether to the Home Office or to the Education Department, are among the points which the promised Royal Commission will be called upon to decide.

#### THE YEAR.

THE year which has now almost passed away has been marked by many striking events, and for the most part by striking events of a painful kind. The murder of an Emperor was followed by the murder of a President. British troops were three times defeated, and France used and wasted her strength in the gigantic blunder of the Tunis Expedition. But throughout the year one subject, and one only, has dominated the thoughts of Englishmen—the unhappy condition of unhappy Ireland. At the beginning of the year, Mr. Parnell was awaiting the issue of a trial destined to show the inadequacy of legal remedies, and at the end of the year Mr. Parnell is in prison under a Coercion Act, and there has not been a day in which Mr. Parnell and his subordinates have not been the cause of anxiety to the Government, distress and shame to England, terror and misery to Ireland. For a whole year England has been trying to solve one of the most difficult of problems, that of coping with a smothered revolution under a system of Parliamentary government. The extreme publicity, the unsparing criticism of the Executive, the jealousy of the military, the anxiety to be fair, the wish to give all a hearing, which characterise the working of this system when seen, as in England, at its best, make its action singularly slow and ineffective when it has to deal, not with open resistance, but with cunning disaffection, a paralysis of law, and a demoralized populace. But if the Parliamentary system has among its many virtues that of teaching patience, England certainly has shown that it has learnt this lesson to the full, if not to an extreme. Whatever may be the sins or follies of which in the past it may have been guilty towards Ireland, it can honestly say that this year it has striven to act towards Ireland in a spirit of perhaps exaggerated kindness and leniency. It endured Irish obstruction until this obstruction became a scandal too great to bear; it tried coercion, but the coercion it tried assumed forms

of extreme mildness; it passed a healing measure, on the simple assurance that it was healing, which violated every principle on which Englishmen regulate their own affairs; it would not suppress the Land League until suppression was far too late to undo the mischief which the League had done; it endures on the last day of the year as it endured on the first the spectacle of baffled law, triumphant crime, and insolent cupidity. It has tried to keep in mind that many Irishmen are very poor, that most are terribly ignorant, and that some have been unjustly treated. It has even risen to the height of bestowing its keenest sympathy on those who most hate it. What the Government has done England has done, whether wisely or unwisely, and it may be safely said that there never was a year in which a strong nation has dealt more gently with a weak one.

The dealings of England with Ireland have been partly in Parliament and partly out of Parliament. For eight long months Parliament sat day after day and night after night, thinking of nothing, talking of nothing, and working for nothing, but Ireland. First came the great struggle with Irish obstruction. The Government was pledged to propose measures of coercion and a measure of land reform, and the small band of Irish obstructionists, dreading coercion more than they loved land reform, hoped by the judicious use of Parliamentary forms to make the enactment of coercion impossible. In this they achieved a great and striking amount of success. They literally kept the English Parliament at bay for week after week. They managed to waste a fortnight in the debate on the Address. They imposed on the House a sitting of twenty-two hours before it was allowed to give precedence over other Bills to the Coercion Bills. A little later they fought their great battle, and all one night, all the next day, and all the next night they went on saying the same things, defying the majority, and killing Parliament with the arrows it itself provided for them. The House of Commons was powerless and beaten, when suddenly its chief had the boldness to assume the powers of a dictator. The Speaker appeared and desired the obstructionist who happened to be speaking to sit down, and summarily put to the vote the question of the first reading of the Coercion Bill. During the day which the Speaker had thus happily begun, Davitt, a convict with a ticket of leave, was arrested; and in their excitement at the blow which had fallen on a dearly and justly valued friend the obstructionists lost their heads and forgot the proper use of their art. One of them was declared out of order by the Speaker; the rest, scarcely understanding what was happening, refused to obey the Speaker's directions, and were suspended and ordered to leave the House. During their absence a resolution was passed that when, on the proposal of a Minister of the Crown, a Bill was declared urgent by a majority of three to one in a House of three hundred members, the regulation of all business should rest with the Speaker; and he subsequently decided that, on a proposal made in the same way and supported by a similar majority, a final vote might be taken at a fixed hour. This finished obstruction of the more scandalous kind, and the Coercion and Arms Bills were rapidly passed, the Opposition giving an honourable and effective support to measures which it thought had come too late, but which were obviously indispensable.

The Land Bill took four whole months to pass, and it cannot be said that this was an unreasonably long time for two Houses of Parliament to spend in the discussion of a Bill which was altogether new in principle, singularly complex in details, so drafted as often to be inexplicable, altering the bases of property, and dealing on the grandest scale with the money of the nation. Mr. Gladstone had pledged himself to bring in a big Bill, and he kept his promise. It was a very big Bill, a marvel of legislation, delegating political economy to the regions of Saturn and Jupiter, but advocated and accepted as a political necessity. The Duke of Argyll left the Ministry rather than admit that political necessity could warrant the abandonment of elementary principles; but the other mode of regarding the Bill, that of looking on it as embodying the proposals of a Government which could not be overturned, and which declared it could not and would not govern Ireland without it, imposed itself on the practical common sense of Parliament. In the Commons the Opposition contented itself with supporting Lord Elcho in a general protest against the measure, and thenceforward limited itself to a temperate and reasonable criticism. Some amendments made by Liberals, forming a body small in numbers but of considerable position in the country and in the House, were only rejected by inconsiderable minorities. The Irish section led by Mr. Parnell refused to support the Bill, but afterwards endeavoured with some temporary success to enlarge its provisions in favour of the tenants. But in the main the Bill left the Commons much in the shape in which it had been introduced, and its successful passage through the House was almost entirely due to the extraordinary energy, perseverance, and subtlety of Mr. Gladstone. When the Bill reached the Lords it was exposed to the scathing criticism of Conservative, and perhaps even more of Liberal, peers. But there was a general concurrence in bowing to a political necessity, the responsibility for which was thrown entirely on the Government. The Lords remedied some glaring defects in the wording of the Bill, introduced some amendments which were obviously beneficial, and proposed others which the Government might fairly contend were inconsistent with its main provisions. At first the Commons slaughtered the amendments of the Lords in a very wholesale manner. The Lords with unexpected courage refused to give way, and a collision was only averted by Mr.

Gladstone keeping his temper, and directing his majority to accept every amendment which he could not pronounce to be fatal to the Bill. The Lords responded in a spirit of wise conciliation, and the Bill received the Royal Assent in a shape which left untouched the full responsibility of the Government for its provisions. Now that the measure has become law, the controversies that preceded its enactment may be forgotten, and it is chiefly important to keep in mind what it was that was enacted. A Court composed of three Commissioners was established which, with the aid of an indefinite number of Sub-Commissions, was empowered to fix for a period of fifteen years, on the application of either party, what it considered to be a fair rent for the tenant to pay to the landlord; and, with some slight limitations, the tenant was to hold in perpetuity, and to be able to dispose of his holding. Provisions were made for compensating the tenant for improvements, for enabling him to purchase his holding, for the abrogation of leases unfairly obtained, and for aiding emigration and reclamation; but experience has already shown that every other provision of the Bill is entirely subordinate to that which permits a fair rent to be fixed. The history of a few weeks has sufficed to prove that the Court can only do a fraction of the work imposed on it, and can only do what it does in a most imperfect and hap-hazard manner. Out of more than 50,000 applications about 500 have been disposed of, subject to appeal, and no one pretends to understand the principles on which the decisions have been made. Some of the Sub-Commissioners have been very indiscreet in their language, and have exposed themselves to ridicule by fixing important interests after merely hopping about boggy fields for an hour or two in a misty morning. But the real difficulty of carrying out the Act lies in the Act itself. For something like half-a-million of holdings a fair rent is to be fixed at a moment when future agricultural profits are clouded with a general uncertainty, and by the elaborate process of taking into account all the uncompensated improvements of the tenant, all the interests of the landlord and the tenant, and all the special circumstances of the case, the holding, and the district. Even if things had otherwise gone smoothly, the Court must have been blocked, and must have worked at random. But things have gone very far from smoothly. Mr. Parnell and some of his principal colleagues have been thrown into prison, and the Land League has been compelled to cease its open operations. But its leaders managed to issue from their prison an order to tenants to pay no rent at all; and this order has been widely obeyed, partly because the tenants thought it convenient to obey it, and partly because enough of those who disobeyed it have been murdered or maltreated to terrorize the well-disposed. Some favourable symptoms may be noticed. Juries have recently shown unwonted courage in convicting for agrarian crimes. Mr. Shaw has withdrawn from the Home Rule Association, of which he now recognizes the treasonable purposes; and a movement excellent in intention, but somewhat mismanaged at its outset, has been set on foot in England for the defence of Irish property. Still, crime walks unpunished; the Fenians seem once more on the stir; and it appears at the close of the year almost as doubtful as it was at the beginning whether the Government of the Queen or the government of the Land League is the real government of Ireland.

Disaffection in Ireland has been supported and stimulated by the publications, the money, and the ruffianism of the Irish in America. A section of these Irish, which it may be hoped is a comparatively small one, has set itself to bring England on her knees and give freedom to Ireland by the free use of dynamite and gunpowder. An attempt was made to blow up the Mansion House, and another to blow up the Town Hall of Liverpool, and it was discovered that explosives had been consigned to Liverpool from the United States, concealed in barrels of cement, and embarked on English vessels. Attempts were made in several towns to seize on the arms of the Volunteers, and although many of the plans of the conspirators remained abortive, the Home Secretary stated in Parliament that the dangers apprehended were very real, and that the Government had to preserve an unwearied vigilance, which had to be extended so far that he could not forego his legal privilege of opening letters in their passage through the Post Office. The revolutionary disorder of the Irish Americans coincided with an outburst of the revolutionary disorder of Europe which produced and followed the death of the Czar, and the Government found itself obliged to prosecute to conviction a German refugee who had violated the laws of the country which sheltered him by publishing a general incitement to the assassination of sovereigns. In a smaller way, much trouble was given to the Government by Mr. Bradlaugh, who, after his claim to affirm had been rejected by a Court of Appeal, resigned his seat, and was re-elected by a small majority. On his re-election he proposed to take the oath, but was prevented by a decision of the House forbidding him to take it during the Session; and he was subsequently ordered by the House not to intrude within its precincts. The Government, which had been defeated in its contention that a new member must be admitted to be sworn without reference to his antecedent objection to an oath, brought in a Bill to make affirmation admissible in all cases, but could make no progress with it; and towards the end of the Session Mr. Bradlaugh attempted to try his rights in a new form and to enter the House, from which he was expelled after an ignoble scuffle. Except for these minor incidents, and apart from the Land Bill, the Session would have offered little else to notice had it not been marked by

the death of Lord Beaconsfield, which terminated a long and wonderful career, deprived Parliament of one of its most commanding figures, and left a perceptible blank in the political life of the nation. He was replaced in the leadership of the Peers by Lord Salisbury, and the party has given in the latter months of the year many signs of awakening energies and revived hopes. The numerical advance of the nation was shown by the Census, which disclosed an increase of four millions in Great Britain, with a small diminution in Ireland; while the Indian Census revealed that two hundred and fifty millions, or, at the lowest, a sixth part of the human race, are under the dominion of the Queen. Mr. Childers was allowed to finish to his desire the reconstruction of the army. Mr. Trevelyan gave a lucid and satisfactory account of the strength of the navy; and a meeting of fifty thousand Volunteers at Windsor testified to the numbers and efficiency of this great auxiliary force. Trade has slowly, but steadily, revived; and there is at last reason to hope that a satisfactory treaty of commerce with France may be made, in spite of the long delays caused by the procrastination and timidity of the French Government. The disappointment produced by a wet autumn after a beautiful summer, their really serious losses, and the misleading precedent of the Irish Land Bill stirred up some of the farmers to shape impossible demands in the crudest of Bills. But the freshening winds of free criticism have already done much to disperse the clouds of this ill-considered movement, as they have also done to disperse those of a still more futile movement in favour of Protection in the disguise of Fair-trade, which attained some notoriety by attracting the lightning of Mr. Gladstone's eloquence at Leeds, and by puzzling Sir Stafford Northcote as to whether he would gain most by speaking honestly as a statesman or by patronizing the pious opinions of influential followers. The alleged cruelties inflicted on the children in St. Paul's Industrial School, after provoking a war of Amazons in the School Board, led to the intervention of the Home Secretary, who shut up the school and ordered a general inquiry into the state of all schools of the kind. More recently Sir William Harcourt has found himself obliged to disappoint the hopes of those who urged the remission of the punishment assigned to persons guilty of bribery at elections—a punishment which ought to have been shared by hundreds of others, which fell with great severity on most respectable people, but which the judges who gave it declared to be the smallest they could conscientiously inflict. How far the degradation of the constituencies is to be carried by the culpable carelessness of Parliament in its legislation on the lodger franchise is still uncertain, even after a Court of Appeal has substituted the determination of a set of small, but insoluble, problems for the gigantic extension of the suffrage declared to be law by the Court below. Whatever may be the constitution of future Parliaments, the majority of the present House of Commons appears to be unshaken in its devoted allegiance to Mr. Gladstone; and the Government might now be thought to be turning, with a fair prospect of success, to its large measures for the United Kingdom, had it not considered itself compelled to reform previously Parliamentary procedure—an undertaking so thorny and so delicate that, as Lord Hartington has recently declared, nothing but the pressure of the Liberal constituencies can bring it to a happy issue.

At the beginning of the year intelligence was received that a party of Boers had treacherously attacked a detachment of the 94th Regiment which was escorting a convoy to Pretoria, that only two minutes had been given it to surrender, that thirty men had been killed, that the garrison of Pretoria had withdrawn into the fort, and that Sir George Colley had asked for reinforcements. This intelligence was followed by the news that two officers of the 94th who had been taken prisoners had been sent, unarmed, to the Orange State, and that one of them, Captain Elliot, had been murdered by the Boers escorting him while he was crossing the Vaal River. Sir George Colley, after issuing a proclamation pointing out that thoughts of wild revenge must be abandoned, but that the stain on the arms of England must be effaced, was rendered so impatient by the tidings of the perilous position of the garrison of Pretoria that, without waiting for reinforcements, he started with only twelve hundred men to the relief of the beleaguered fortress. He found 3,000 Boers strongly posted at Lang's Nek, attacked them with a force one-third of their strength, and was defeated with a loss of 200 men. A few days afterwards he made a reconnaissance across the Lugogo River, retired in face of an overwhelming force of Boers, and lost 150 men in the terrible confusion which attended the re-crossing of the river by night. On the 26th of February he made his last fatal attempt to overcome the resistance of the enemy. With 700 men he gained, unperceived, the commanding position of the Majuba Hill; there he remained for some hours undisturbed until a small party of Boers, creeping up among brushwood, created a sudden panic, killed Sir George Colley and some of his more gallant comrades where they stood, rolled the British force down the hill, and killed more than 200 fugitives. Meantime the Government had not been inactive. It had announced in the Queen's Speech that it accepted as an imperative duty the task of putting down armed resistance to the Queen's authority. It had sent large reinforcements to the aid of Sir George Colley and his successor Sir Evelyn Wood, and it finally entrusted the command of an overwhelming force to the most distinguished officer at its disposal, Sir Frederick Roberts. It was supposed that the disgrace of Majuba Hill would be speedily and effectually retrieved; when it was suddenly announced that the struggle was at an end, that

the triumphant Boers were to be left unharmed, and that, with the retention of a shadowy suzerainty and some provisions for the security of the native population, the independence of the Transvaal was to be conceded. It was agreed that British troops should not enter the Transvaal; but when it was found that Colonel Winalow had been induced to surrender Potchefstroom after the conclusion of the armistice, of which the Boers were aware while he was not, the Boers were made to restore what they had gained by treachery; and the murderers of Captain Elliot were brought to a mock trial in which they were at once acquitted by a friendly jury. A Convention embodying the terms of the armistice was concluded between Sir Evelyn Wood and the Commissioners of the Boers, with the assistance of the President of the Orange State, and was ultimately ratified by the Boers in their Assembly, the ratification being accompanied by a significant intimation that it was expected the Convention would be modified if not found to work satisfactorily. Very recently the Transvaal has been evacuated, and the Boers have been left tranquilly to themselves. The conduct of the Government was necessarily exposed to strong and severe criticism, and the case against it was stated with peculiar force and energy by Lord Cairns in the House of Lords. There was no wish in England to retain the Boers in subjection against their will; there was no desire to incur the reproach of what Mr. Gladstone termed "bloodguiltiness"; but it was generally felt that an earlier intimation of the change in the views of the Government might have spared fatal disasters; and that, without the shedding of blood, an overpowering force might have been so used that the Boers would have had to treat, not as conquerors, but as conquered. A somewhat similar controversy arose as to the evacuation of Candahar and what Lord Beaconsfield termed "the scuttling out of Afghanistan." All that can be said is that the Government was pledged to retire from Afghanistan, and that it has retired—whether wisely or not time alone can show; but, for the moment, accident has befriended the Government. There are few who watch the stealthy and incessant progress of Russia towards India, while all can understand that Afghanistan—including, not only Candahar, but Herat—has been at least nominally united under the sovereignty of the temporary ally of England. Candahar was taken by Ayoub, through the desertion of the troops of Abdur-Rahman, and was retaken by Abdur-Rahman by the desertion of the troops of Ayoub, who found himself shut out from Herat, and is now an exile in Persia. In the minor matters of South Africa, apart from the Transvaal, the Government has scarcely been equally fortunate. A difference arose between Lord Kimberley and the Cape Ministry as to the terms imposed on the natives at the conclusion of the Basuto war; Lord Kimberley was forced to find a better man at a higher price than the able but obscure official whom he had selected for the Government of Natal; and the combinations of local intrigues induced the Parliament of Portugal to reject the Lorenzo-Marquez Treaty, by which England had been granted a valuable access to the sea at Delagoa Bay.

It is in the sphere of purely foreign politics that the Government has had its greatest success. It settled on equitable terms the Greek question, which seemed at one moment likely to disturb the peace of Europe; it has shown wisdom and patience in dealing with the difficulties of Egypt, and it has borne itself with courtesy and firmness through the irritating trial of the Tunis expedition. It was chiefly through the exertions of Mr. Goschen that the Greek question was settled. The cause of the Greeks had been abandoned by France with an indecent and cynical haste; but Mr. Goschen passing through Berlin secured the all-powerful aid of Prince Bismarck, and after arbitration had been in vain proposed, and Turkey had hinted that a cession of Crete might be substituted for cessions in Europe, a compromise was effected by which almost all Thessaly was handed over to Greece, while Janina was retained by Turkey. Greece, bowing to the commands of Europe signified in an identical note, accepted what was offered, gained without an effort what it could never have won by arms, and was astonished at finding that Turkey executed its agreement with unexampled punctuality. The troubles of Egypt have chiefly arisen from military insubordination. Three officers having been arrested in February, their regiments released them, marched to the palace of the Khedive, and demanded and obtained the dismissal of the Minister of War. In June the ring-leaders of the revolt ordered a decree to be issued permitting every regiment to appoint and dismiss every officer below the rank of Colonel. In September Araby Bey proclaimed himself the head of a national party, and, leading his followers to the palace of the Khedive, directed the trembling Prince to dismiss the Ministry of Riaz Pasha, and summon an Egyptian Parliament. For a moment it seemed as if the Khedive would show something of the courage which Sir Auckland Colvin was trying to infuse into him; but the opportunity was lost, the Khedive submitted, Riaz was dismissed, and Oherif Pasha was appointed in his stead. Soft words and money combined to induce the Colonels to condescend to remove their regiments to a distance from Cairo, and there was enough of sincerity in their national aspirations to make them regard the intervention of Turkey as the worst of all possible evils. The Sultan would have been delighted to send troops which, under the pretext of suppressing anarchy, would have imposed his authority as Caliph on a rival centre of Mahomedanism. This the Western Powers forbade, and he had to content himself with sending a Commission, which was coldly and politely received, and might be said to have effected nothing, had it not apparently convinced the Khedive that his

hope of future safety must lie in his allying himself with his suzerain against his soldiers and his subjects. This was a state of things which at every stage needed to be treated by the English Government with the greatest caution and care, more especially as the troubles in Egypt were undoubtedly due in part to the commotion produced throughout the Mahomedan world by the violence and pretensions of the French in Tunis. Revealing his policy as occasion arose, Lord Granville laid down the salutary doctrine that it was not the business of England to make or unmake Egyptian Ministries; that she would work cordially with France so long as France would work loyally with her; that the existing rights of the Sultan must be maintained, but could not be extended; and that England would only intervene by force if anarchy in Egypt made intervention a painful but necessary duty.

Early in April it was announced that France was going to send a force of no less than twenty-five thousand men to punish the Kroumirs, a plundering border tribe on the Algerian confines of Tunis. When the force began its operations, these marauders vanished into space; but, as the French were the allies of the Bey, and must do something to help him, they successively occupied his fort of Tabarca, his town of Kef, and his grand harbour of Biserta. M. St.-Hilaire published a beautiful circular, in which he explained and justified the objects of the expedition. France was coming as a beneficent angel to make Tunis rich and happy. There was no end to the fine things which French money and enterprise were to accomplish in Tunis, and even ancient Roman watering-places were to be restored to rival Vichy and Plombières. In pursuance of these kind intentions, a French general at the head of his troops arrived at the Bey's palace of Bardo, pulled out of his pocket the draft of a treaty with which he had been provided by the French Foreign Office, and gave the Bey two hours in which to sign a convention which handed over himself and his State to the dominion of France. The agreement enforced by these gentle arts of persuasion stipulated that at home the Bey should do everything that the French desired, and that abroad he should be represented by France and by France exclusively. Once more M. St.-Hilaire explained the inexplicable, and proved in his pleasant way that France had no dreams of annexation or conquest, but was merely asserting in an innocent and polite manner the claims to a friendly influence in Tunis which were justified by its position in Algeria. The French Parliament ratified the treaty almost without discussion, and was quite ready to grant a sum of money sufficient to finish off what had been so happily begun, and to bring the troops home to France in triumph. The Porte, receiving no support from the Powers in its claims to establish or revive a supremacy over Tunis, had to content itself with strengthening its army in Tripoli. Italy was very vexed and very indignant; but could find no other way of expressing its mortification than by exchanging one Minister who was prepared to do nothing for another who was prepared to do as little. Lord Granville, who had previously sent an iron-clad to prevent the use of force in favour of a French Company and against an English subject in the Enfidra case, accepted the treaty, but hinted in the politest language his opinion as to M. St.-Hilaire's circulars, insisted that all the treaty obligations of Tunis to England must be rigidly maintained, and intimated that England would not see with indifference the extension by France of her forcible benevolence to Tripoli, where she would be getting inconveniently near to Egypt. At first things went smoothly, and the great M. Roustau, who had got up the expedition in concert with the Foreign Office and an Italian adventuress, was appointed at once Consul-General of France and Resident Minister of the Bey. But it soon appeared that the bright hopes of M. St.-Hilaire were destined to disappointment. The Arab population, which did not appreciate the blissful intentions of France, was indifferent to the revival of Roman watering-places, and failed to understand how its Bey with a pistol at his head could by a stroke of the pen hand over all his subjects to the foreigner, broke into an insurrection which was triumphant for months, and is even now only partially suppressed. The inactivity of the French, who did little besides bombarding, occupying, and pillaging Sfax, is partly to be explained by the difficulties of the climate in summer, and partly by the reluctance of the French Ministry to let the country into the secret of its disasters before the elections were over. When autumn and the result of the elections left the Ministry free to act, the French troops put down the resistance of the Bey's troops, with whom they were co-operating, took the holy city of Kairwan, and pursued the retreating Arabs to the south and the borders of Tripoli. Meanwhile, the insurrection had extended to Algeria; a colony of Spaniards had been murdered, and France had a new difficulty on its hands in the shape of an indemnity demanded by Spain. When, in November, the history of the expedition came under the review of Parliament, the French Chamber, treating the discussion merely as the occasion of M. Ferry's fall, expressed neither approval nor disapproval, and contented itself with declaring that the Bardo Treaty must be upheld. Subsequently the secret origin of the expedition was suggested or disclosed during an action for libel brought against M. Rochefort by M. Roustau. The jury, supplying the deficiencies of evidence by the impulses of popular indignation, acquitted M. Rochefort; but M. Roustau was warmly defended by the Foreign Office, and is now, it is said, to return in honour to the scene of his former exploits. In the internal politics of France the great event of the year has been the long-talked of and the long-delayed advent of M. Gambetta to power. In the summer M. Gambetta, in opposition to the

notorious opinions of M. Grévy, had done his utmost to secure the adoption of election by *Scrutin de liste*, which was accepted by a very small majority in the Chamber, but rejected by the Senate. Whatever may be the faults of the existing system of election, M. Gambetta could not complain that it checked the Republican triumph, for the elections which were held in August resulted in the crushing defeat of the feeble monarchical parties. When the new Chamber assembled, it became evident that M. Gambetta, who, after the rejection of the *Scrutin de liste*, had occupied himself with projects for the revision of the Senate, who had been received with Royal honours at Ochers, and with every mark of devoted admiration at Neuchâtel and Houdouin, but who had found his influence undermined at Belleville, was the only possible Minister that France would endure. At last the grand Minister was in office; but the Ministry he formed was anything but grand. It was composed of men almost entirely unknown, and included in its list the name of M. Paul Bert, who, as the most bitter enemy in France of clerical influence and clerical teaching, was appointed to the joint Ministries of Public Instruction and Religious Worship. Since he was installed in office M. Gambetta has adopted the wise policy of saying little and doing nothing. He has the strength so seldom found in French Ministers—the strength to wait; and France, although it rejoices that at the end of the year the man of its choice is in power, knows almost as little of his policy and aims as it did at the beginning.

Prince Bismarck has fully maintained his control over the foreign policy of Europe. Austria is as much attached to him as ever; and the new Czar came to meet him and his master at Dantzig, and returned full of his unexpected moderation. He has thought proper recently to snub Italy, and to warn Europe against her Republican tendencies; and he has become the object of the prostrate devotion of the Porte, which, obedient to his nod, settles its finances, blows hot and cold about Armenia, and looks with patience on the application of the Austrian conscription to the Sultan's subjects in Bosnia and Herzegovina. But at home he has had a troubled time. He retains his boundless command over the aged Emperor, but he has quarrelled with every one else. He has been at daggers drawn with two successive German Parliaments. He had to remonstrate with the Upper House of the Prussian Parliament when that ordinarily submissive body seemed half inclined to thwart him in his readjustment of taxation; he has had to scold the Chambers of Commerce, which revealed with ignorant honesty the consequences of his beloved protectionist tariff; he cannot heal his old quarrel with the Church; the Socialists trouble him as much as ever; and at the recent elections he found himself in antagonism to the most educated, independent, and active classes of the community. At the beginning of the year he thought proper to summon a little extra Parliament or Council of his own, which was to hear and adopt his views, give him information, and anticipate the conclusions of the more regular body; but both the last and the present Parliament have resolutely refused to repay the expenses of the amateurs who were destined to supersede them. He in vain laid before the last Parliament some curious schemes of State Socialism, including a project for State insurance in favour of workmen, a project for the relief of the infirm, and a project for the revival of mediæval guilds. When the new Parliament met he got the Emperor to say that all these projects were especially dear to his aged bosom, and that he could not die happy until he saw them carried out; but the only effect produced was the creation of a general impression that the intrusion of the Emperor's alleged personal feelings was irrelevant and inappropriate. At present he seems to be occupied with making overtures to the Pope, and with uttering threats that he has done without Parliaments before this and may think fit to do without them again. Both Germany and Austria have been gratified with the spectacles of popular and suitable Royal marriages, Prince Frederick William, the eldest son of the Crown Prince, having married in March the Princess Augusta of Schleswig-Holstein, and Prince Rudolph, the eldest son of the Emperor of Austria, having married in May the Princess Stephanie of Belgium. Baron Haymerle died in the autumn, and was replaced by Count Kalnoky; but the change indicated no alteration in the foreign policy of Austria, which at present seems to lie in the direction of combining with Russia, under the supervision of Germany, for the adjustment of such matters as interest them alike in Eastern Europe. The sensitiveness of Austria was recently somewhat ruffled by a speech of the new King of Roumania on the opening of his Parliament, in which he stated, in language less prudent than plain, that Austria was trying to bully Roumania with regard to the navigation of the Danube, and that Roumania would not stand it. But, as King Charles got no encouragement from Berlin, he directed his Minister to make a profuse apology; and this small diplomatic quarrel will soon apparently be ended. At home the Hungarian elections went in favour of the Ministry, and in Austria Proper Count Taaffe never seems to lose or gain ground in his ingenious attempt to govern by disappointing one party after another. Towards the end of the year the King of Italy paid a solemn visit to Vienna, the avowed object of which was to cement an alliance with Austria as a protection to Italy against France, from whom Italy had been alienated by the Tunis expedition. The prosperous state of Italian finance has enabled Italy to contract a great gold loan, which will permit her to enjoy the credit and comfort of a metallic currency; and the question of electoral reform, the bugbear of one Ministry after another, has been disposed of by the adoption of a scheme giving the franchise to all who can read and write. On the other

hand, the relations of Italy with the Pope are more strained than ever, partly owing to the unseemly riots which disgraced Rome, and which the police could not repress, on the occasion of the transport of the remains of the late Pope to their final resting-place.

Russia and the world were horrified early in the spring by the announcement that the Emperor Alexander had been brutally and foully murdered. As he passed in his carriage a bomb was thrown from the crowd by which a Cossack was wounded; the Czar stopped down to see the wounded man, a second bomb was thrown, and the Czar was so terribly injured that at the end of a few hours he died. At first it seemed as if his successor was inclined to seek popular support by making concessions, and Count Melikoff was directed to publish a liberal decree which had been prepared during the reign of the Emperor Alexander. But a change soon came over the spirit of the young Emperor, who was alarmed at the extent to which disaffection had spread, and found that it had penetrated even the higher ranks of the army and navy. Count Melikoff was replaced by General Ignatieff; the Czar shut himself up, a close prisoner, in the palace of Gatchina; and a final ukase has been issued, declaring that the Czar will fight out to the bitter end his quarrel with Nihilism. Some distraction to popular discontent has been provided by the riotous amusement of Jew-baiting, in which the Russians have improved on their German example, and have plundered and maltreated every one known or supposed to be a Jew, including, it was said, a person no less illustrious than Mrs. Sarah Bernhardt. In the regions of its Asiatic possession Russia has won new triumphs. Gheok Tepe, the stronghold of the Tekke Turcomans, was taken by General Skobelev, after an obstinate resistance; a position was ultimately secured which commands not only Merv, but Herat; and Russia now finds herself entitled to ask for what she terms a rectification of the northern frontiers of Persia. It was probably the countenance of Russia, and it was certainly the co-operation of a Russian general, that prompted and enabled Prince Alexander of Bulgaria to effect a *coup d'état* in his tiny principality, by which he got rid of the Constitution that was obnoxious to him, imprisoned or exiled his chief opponents, and induced the peasants to give heed to the presence of his troops, and declare him the elect of the people and the dictator of Bulgaria for seven years to come. In Turkey a scandal that had long been sleeping was revived by the determination of the Sultan to bring to a public trial the supposed murderers of Abdul Aziz, among whom was Midhat Pasha, who sought refuge in the French Consulate at Smyrna, but was surrendered and sent to meet his fate at Constantinople. The trial ended in the accused being sentenced to death; but it had been conducted in a manner so very peculiar, even for Turkey, that, although the Ambassadors did not openly interfere, they conveyed the opinion of Europe to the Sultan, and the sentence was commuted into exile to Arabia. Harassed as he has been by the claims of Greece, distracted by a rebellion in Albania, worried by the persistent demands of England for reform in Armenia, and occupied with weaving constant dreams of triumphant Pan-Islamism in North Africa, the Sultan has still found time to make a financial arrangement with his creditors; and Mr. Bourko has secured a fortune for the bankers, a trifle to begin with for the bondholders, and shadowy hopes of something more to come in a distant future. Nor is this the only notable financial settlement of the year. At the other end of Europe, Spain, too, has made one more arrangement with her creditors. The elections had confirmed the power of the Liberal Ministry; the popularity of the King was established; the revenue was increasing, and might, by judicious arrangements, be still more increased; and Señor Camacho, when he produced his Budget, was enabled to show that Spain could consolidate its Privileged Debt at a comparatively low rate of interest, and could give the bondholders the happiness of seeing where in future the money allotted to them might probably come from.

Scarcely four months after the murder of the Czar the startling intelligence was received that an attempt had been made to murder the President of the United States. For weeks President Garfield lingered on, until in September death put an end to his sufferings. The unstained integrity of his past, his simple and manly character, and his patient fortitude attracted the eager sympathy, not only of his own people, but of the whole civilized world. Pity and indignation were alike increased when it was found that there was scarcely a shadow of a motive for the murder, and that it was the work of an empty-headed, disappointed office-seeker, who, having inflicted on his country the stain of a wanton murder, has since inflicted on it the stain of a trial conducted with revolting indecorum. Day by day, as the President lingered on, the hopes, the fears, and the interest of millions were expressed in language that came from the heart, and were expressed by no one more warmly and pathetically than by the Queen of England. The sufferings and death of President Garfield united the two great branches of the English race in a common sorrow, and the responsive gratitude of the American people found utterance in a salute being paid to the English flag when the centenary of Yorktown was celebrated. The time during which President Garfield had been in office had been too short to be signalized by anything more prominent than his quarrel with Senator Conkling over the appointment of Mr. Robinson. His successor, President Arthur, has also been too short a time in office to gain reputation or disclose a policy; but he has inherited from the Cabinet of his predecessor two strange annotations or exaggerations of the Monroe doctrine. The Chilians, after defeating the Peruvians in two pitched battles outside Lima,

gained possession of the city, forced President Pierola to fly, and set up a new President in his stead. But they failed to make an arrangement by which the heavy terms they sought to impose, including a cession of territory, a large indemnity, and the prohibition of a Peruvian navy, could be accepted, and they continued, and still continue, to occupy the capital of the enemy. After their occupation had lasted some months, Mr. Blaine thought proper to intervene by a despatch which misled the American representative in Peru into declaring that he had been instructed to say that the United States would direct the combatants to accept the terms of peace that the Washington Government might think proper, and which, if this was a misconception, certainly intimated that no other Power would be permitted to use its endeavours to put an end to the war. M. de Lesseps, again, has been actively pushing on the construction of the Panama Canal, and the Government of the United States, seeing at last the importance of the enterprise, now seeks to obtain exclusive control over it, and asks England to tear up the Clayton-Bulwer Treaty on the plea that the Canal is mainly to be regarded as a channel for the constant trade of the States. It can only be hoped that, by the exercise of courtesy, patience, and firmness, Lord Granville will surmount these new diplomatic troubles.

No deaths during the year have been so startling as those of President Garfield and the Czar, and no one has passed away who had attained anything like the same eminence in politics and literature as Lord Beaconsfield; but the death-roll is long of those who were distinguished in literature, in politics, in law, in science, and in art. The melancholy, the bitterness, the vivid historical power, the philosophy so pregnant in its hint, so vague in its aims, of Mr. Carlyle, were buried in the grave which he had long looked on as the only haven he desired; an end that seemed premature came to the bright sympathy, the large tolerance, and the genius for the picturesque, of Dean Stanley; while France lost in M. Littré one of those few students of a language who have the real passion for study, and England lost in Mr. Spedding one of those fine scholars and rare biographers who toil through years of conscientious labour in order to do justice, or more than justice, to the object of their admiration. In the political world there passed away, besides Baron Haymerle, M. Dufaure, the last relic of the old-fashioned, stern, upright, and perhaps narrow, French Parliamentary school; Count Arnu, the erring, but high-minded, victim of Prince Bismarck's animosity; Mr. Adam, one of the best, most adroit, and most beloved of Parliamentary officials; Sir William Heathcote, who had long dignified the House of Commons as a perfect specimen of a University member; Mr. Miall, the most ardent and uncompromising of Nonconformists; Archbishop McClure, long known as the Lion of the Tribe of Judah and the friend of O'Connell; and one less known, but who for years served England well in the difficult position of our Envoy at Cabul, Ghulam Hussein Khan. The legal world has had to deplore the loss of the gentle wisdom of Lord Hatherley; of the vigorous and well-informed common sense of Lord Justice James; of the acumen and inexhaustible learning of Lord Justice Lush; of the intelligence, once so bright and sparkling, of Sir John Karslake; and of the vast erudition and varied knowledge of M. Bluntschli. The gay world of birds will no more be depicted with loving accuracy by Mr. Gould, and the scanty rays of Oxford science have been dimmed by the departure of the lamented Professor Rolleston. Thousands who have been moved by his Garrick and convulsed by his Dandrey mourned the death of Mr. Sothorn; but, above all, the lovers of English architecture have been stricken, for they have had to deplore at brief intervals the loss of Mr. Burgess, who was unsurpassed in his knowledge of the early French style; of Mr. Decimus Burton, the last lingering representative of the old Italian school; and of Mr. Street, who had lived to be the chief exponent of English Gothic, and who has left behind him the best of memorials in the new Courts of Law, which are now rapidly approaching completion. And, if the year has been marked by many deaths, it has also been marked by a strange series of physical convulsions and sad catastrophes. On the 18th of January England was almost buried in a fall of snow so wild and violent that London was nearly cut off from the country. On the 14th of October a sudden blast of wind laid prostrate in a few minutes hundreds of the finest trees in the parks of the metropolis. An earthquake at Scio buried five thousand persons in the ruins of the shattered buildings, and left forty thousand others homeless and exposed to the supervening pestilence. Cholera has raged among the unfortunate pilgrims of Mecca; the burning of the Opera House at Nice was followed by the exactly similar, but much more fatal, calamity of the burning of the Ring Theatre at Vienna; and more recently the Wigan colliery explosion, the Canonbury railway accident, the fatal panic in a Warsaw church, and Mr. Powell's lost balloon, have given warnings how near death may stand to all in fearful and unexpected shapes. Private persons who have been blessed with tranquillity during its passage may look back on the closing year as a happy one; but to the public it has been a year of much pain, little satisfaction, and many losses; and a hope that the new year may be a brighter one may this time be expressed with more than ordinary fervour and sincerity.

#### THE CONCORDAT OF 1801 AND THE ORGANIC ARTICLES.

OUR readers may have noticed a fresh announcement in the Paris telegrams of the *Times* of Wednesday last that the new Minister of Public Worship intends to enforce a strict and literal observance of the Concordat, including, we presume, the Organic Articles, which, though never recognized at Rome, form in the estimation of the French Government an integral part of the agreement. It appears indeed that, as a preliminary step, the prefects have already been directed to furnish him with written information regarding the character and antecedents of the different bishops, "their subordinations." We took occasion not long ago to say something of the history and general bearings and effects of the Concordat of 1801, which grew out of the revolutionary catadysm of the old Gallican Church, but was in its main features a reproduction of the Concordat of Bologna, adapted to the exigencies of the Napoleonic régime. But those who are not familiar with the subject may like, in view of its revived importance under M. Paul Bert's Ministry, to have a somewhat more precise account of its leading peculiarities, though we cannot of course here undertake to exhibit in detail the 17 Articles of the Concordat, and still less the 77 supplementary Articles which Napoleon with characteristic inaccuracy tacked on to it, under the title of *Articles Organiques de la Convention du 26 Messidor an IX. entre le Pape et le Gouvernement Français*, but which the Pope had never even seen or heard of before their publication, and protested against as soon as he did hear of them. We may first repeat, what we said before, that the general aim and tendency of both Concordat and Organic Articles, but especially of the latter, was to form not an independent national Church, but a Church absolutely dependent on the sovereign power in the State. With this view, however, while the ancient rights of the native episcopate and ecclesiastical corporations were systematically superseded or ignored, the arbitrary powers of the Pope, as well as of the Sovereign, were increased, with the intention that the latter should rule the Church through the instrumentality of its nominal head. Napoleon's leading idea was to make the clergy into a moral police, with the bishops for prefects, whose chief duty would be to preach the obligation of devoted loyalty to the Empire, while, if he could have had his way, the Pope himself must have merged his ecumenical position in a kind of French patriarchate, residing at Paris with an ample revenue, and acting—to use a phrase he actually employed in one of his letters—as head Chaplain to the Emperor. Such a functionary, he consistently argued, could not be too absolute, as long as he remained the mere mouthpiece and instrument of the spiritual absolutism of the civil Sovereign.

It was impossible of course that Napoleon's scheme of Church policy should be carried out in its entirety. But the broad result, as might have been expected, and as it may pretty safely be predicted would under similar circumstances occur again, was to promote first a tone of slavish and vicious Erastianism, and then, by an inevitable and speedy process of reaction, to give an unprecedented impetus to that spirit of fervent Ultramontanism which for the last half-century has dominated the French Church. Under Napoleon I. the clergy for the most part assumed the character of servile Imperialists; under the restored Bourbons they fell back at once on their more natural and traditional principles, and seemed almost to exalt the divine right of kings into an article of faith, to their own grievous hurt and discredit, when the Revolution of 1830 again changed the political condition of the country. Louis XVIII. had indeed attempted in 1817 to introduce a new Concordat, restoring as far as possible the endowments and status of the Church as it existed before the Revolution, but this the Parliament refused to accept. He did actually revive thirty of the suppressed sees, thus raising the whole number to ninety, not, as he had desired, to its original complement of 131 dioceses. At the second fall of the Bourbons the clergy, who had so warmly supported their cause, became doubly unpopular, and—partly on that account, partly because they perceived that it was in fact solely through its union with Rome that the French Church had been kept together at all through a revolutionary crisis which had shattered all purely national institutions—became also fervently Ultramontane. And in their recoil from a royalist Erastianism which had suddenly collapsed, and under the oppression of a monarchy which was Erastian without being royalist, in the sense of having any pretence to hereditary divine right, their Ultramontanism was moulded by leaders like Lamennais and Montalembert into the novel form of a sort of political liberalism singularly out of harmony with Gallican precedents and more than unfriendly to the Government of Louis Philippe. And such, with the episode of a more or less sincere revival of Napoleonic enthusiasm under the Second Empire—sternly discouraged, to do them justice, by their leading men of an earlier generation both clerical and lay—has been their prevailing attitude from that time to this. It will certainly not be modified, in the direction of a closer and more cordial alliance with the civil Government, by seeking to enforce with a severity hitherto unknown, or long since virtually abandoned, the observance of the strict letter of the Concordat as it is understood by M. Paul Bert.

We have before explained that one very important point in the Concordat, and one which incidentally at least recognized or created an almost unlimited Papal absolutism, was the new circumscription of French dioceses, which were reduced by a stroke of the pen from 131 to 60, all the surviving bishops—of whom there were 81—being required to resign within ten days. Forty-

five consented; the remaining thirty-six—including fourteen resident in England—refused, as did most of the "Constitutional" bishops, and all these were summarily deprived. The vacancies thus created were to be filled up by the First Consul, who could select at his pleasure from the ranks of the ancient hierarchy or of the "Constitutionals," and he was also to have the right of nominating to all vacant sees in the future, his nominees receiving canonical institution from the Pope, who thus retained a veto on the appointment. All bishops and ecclesiastics of the second order (priests) were to take an oath of allegiance to "the Government established by the constitution of the French Republic" before entering on their duties, which is now, according to current reports, to be again rigidly exacted. There is nothing offensive in the form of oath itself, though perhaps it may be thought invidious to require of one particular class specific pledges for the discharge of duties incumbent on every good citizen. The bishops thus appointed and pledged are directed in the Concordat to make a new division of parishes which must receive the approval of Government; they have also the right of nomination to all the cures in their respective dioceses; but here again Government approval is required for their nominees. All claim to the confiscated property of the Church was to be definitely relinquished, and the Government guaranteed in lieu of it *un traitement convenable* to the bishop and curés appointed under the new system, and also promised facilities for securing such new endowments as French Catholics might choose to bestow. These are the principal articles of the Concordat with the exception of the first, which guarantees the free and public exercise of the "Catholic, Apostolic, and Roman religion"—expressly declared to be that of "the great majority of French citizens"—and the last, which, if strictly applied under existing circumstances—as will certainly not be the case—might rather seriously embarrass the action, not of the Church, but of the Government in France. It runs thus:—"It is agreed between the contracting parties that, in case any successor of the present First Consul should not be a Catholic, the rights and prerogatives above mentioned, and the nominations to bishoprics, shall be regulated in accordance with these provisions by a new Convention." M. Paul Bert is not indeed First Consul, for that office no longer exists, but he stands in the place of the First Consul as the official representative of the State in its dealings with the Church, and he is so far from being a Catholic that he has ostentatiously and somewhat contemptuously repudiated, not only all Christian, but all theistic belief. Yet, instead of his being held thereby disqualified for the exercise of ecclesiastical functions, M. Gambetta, as we know, has gone out of his way to remodel the existing arrangement of Cabinet offices for the express purpose of thrusting the Ministry of Public Worship upon him. The Concordat therefore, if it is to be strictly enforced on one side, is clearly not intended, so to speak, to be enforced all round.

But that is not all. The Concordat was presented to the Corps Législatif in a plausible and conciliatory speech by M. Portalis, Minister of Public Worship, on April 5, 1802. Three days later, on April 8, "Bonaparte, First Consul," proclaimed, in the name of the French people, 77 "Organic Articles," of which no whisper had previously been suffered to escape, as part and parcel of "the aforesaid Convention between His Holiness and the French Government." In a Secret Consistory held on May 24 following Pius VII. solemnly protested against these "other articles of which he had not known," and insisted on the necessity of their being altered, as contravening the principle of "rendering unto Cæsar the things that are Cæsar's and unto God the things that are God's." No such alteration was made, and the Organic Articles continued to be treated by the Government as an integral part of the Concordat, but in practice they have never been rigidly enforced in all their details. We can but summarize here the leading provisions of this supplementary code. No official document of the Court of Rome is to be introduced into France, nor any emissary from Rome to exercise his functions there, without express permission of the Government. No synod of any kind, diocesan, metropolitan, or national, may be held in the country without similar permission, nor may the decrees of any foreign Council, Provincial or General, be received until after being examined and approved by the civil power. An appeal *dans tous les cas d'abus*—a category defined in very comprehensive terms—lies from the ecclesiastical tribunals to the Council of State. Archbishops and bishops are to use no title but that of *citoyen* or *monsieur*; hence M. Bert has already dropped the customary designation of *Monsieur*. Another Article, which he has recently threatened to enforce, forbids any bishop to leave his diocese without the permission of the First Consul. All regulations made for ecclesiastical seminaries, as well as the names of all students under training there, are to be submitted to him, as also a list of those who are from time to time to receive holy orders. Only one liturgy is to be used throughout France—a provision first brought into force by Pius IX., who suppressed all the old diocesan uses—and no festivals besides Sunday can be established without Government permission. No religious ceremony can take place outside the walls of the church in towns where there is any temple dedicated to a different form of worship, nor can bells be rung for any purpose except to summon the faithful to church—neither the only nor the principal use of bells in Roman Catholic countries—without the sanction of the police. The nuptial benediction can only be given to those who produce a certificate of previous civil marriage. Several minute and somewhat vexatious regulations are also laid down about preachers, which might easily be so enforced as to "tune" or gag the pulpits at the discretion of the civil ruler. There are various petty and technical rules on other points of no great

importance in themselves, which might fairly enough entitle Napoleon I. to the sobriquet bestowed by the King of Prussia on Joseph II. of Austria, "my brother, the Sacristan." It is almost needless to observe that, while common sense rather than compulsion has secured the observance of many of these regulations, others have been suffered to lie dormant, and that the attempt to enforce them all in the letter would practically constitute just that sort of petty and stupid persecution which, if not seriously prejudicial to its victims, is intensely provoking, and is sure to rouse their bitter antipathy, not to say antagonism, against the Government responsible for it, without any compensating advantage. They regard it, if Mgr. Freppel, Bishop of Angers, may be taken for their spokesman, as an attempt "to force back the Church a century, and reimpose the restrictions which fettered it on the morrow of the proscriptions of the Directory and the crimes of the Reign of Terror." However we are not concerned here to discuss M. Gambetta's motives for a course of policy which to men of all shades of opinion out of France, and to at least a very large minority of French citizens, appears equally arbitrary and unwise. There are many provisions in the Concordat, as interpreted by the Organic Articles, which a skilful pontiff, who knew how to play his cards and was able to maintain amicable relations with the Government, might utilize for the promotion of Papal and episcopal absolutism; and it is studiously framed throughout to facilitate the exercise of civil despotism over the ecclesiastical order. What it cannot subserve, and can hardly fail more or less gravely to prejudice—it would indeed be a slur on the astute penetration of its author were it otherwise—is the formation of a healthy and independent religious life in the clergy and hierarchy of the national Church.

#### FIRES IN THEATRES.

THE attention called in this country to the existing and possible dangers from fire, or alarm of fire, in theatres and places of public assembly by the horrible occurrence at the Ring Theatre in Vienna, has in various ways been kept alive. It has too often happened that a disaster of this kind has done nothing more, after the first shock, than stimulate a temporary activity among people directly concerned in doing or wishing to do all they can in taking preventive measures. After the late disaster, however, a movement which, it may be hoped, will not be without result, was set on foot by a body of persons whose profession involves a close and continual acquaintance with the arrangements of the audience part of all important London theatres, and since that time various disasters, as perhaps was to be expected, have occurred in theatres and other places of amusement or assembly. Fortunately, these disasters have been comparatively on a small scale, and, but for the general horror excited by the Ring Theatre catastrophe, some of them might have been less heard of. But it is satisfactory to note that public attention seems now to be seriously directed to these matters, and it is perhaps even more satisfactory that in more than one case the result of a sudden scare has at the same time served to keep people's minds alive to dangerous possibilities, and to prove that, with proper arrangements, even an unreasoning panic need not have fatal results.

The movement to which we have referred was started last week at a meeting of the dramatic critics of the principal London papers, and at this meeting certain resolutions were passed. Before we go into this question, it may be convenient to say something of recent alarms and disasters, by far the most serious of which since the case of the Ring Theatre has been caused by the alarm of fire raised in a church at Warsaw. Of this, according to the latest reports, the result has been twenty-nine deaths, and over a hundred more or less serious injuries. In London on Tuesday night last a similar alarm was raised at the Grecian Theatre. As might have been expected, many of the audience made a rush for the exits without waiting to make sure whether the alarm was true or false, and, as might not have been expected, no one, according to a report, "appears to have been hurt in the slightest degree, although some eight hundred persons rushed out of the place in a headlong, frantic manner." A considerable part of the credit for this is no doubt due, not only to the provision of ample exits, but also to the presence of mind preserved by "the manager and others on the stage," who set themselves to the task of allaying the panic. Had the same presence of mind been retained in the face of a too well-grounded alarm by those on the stage of the Ring Theatre, much, if not all, of the horrors which then ensued might have been avoided. There are still many people who remember the coolness with which Charles Dickens, standing on the stage in front of a blazing piece of scenery, reassured his audience, and prevented a panic in a place where its results could not but have been of the most serious kind. The action of one master-mind in this way has, of course, its effect both on those in front of and those behind the lights. It persuades the audience to sit still, or, at least, to take measures for escape in an orderly fashion, and it encourages the firemen, or the temporary firemen, to go about their work methodically and swiftly. Another panic occurred at Leeds on the same night as that at the Grecian, and with more reason, since some decorations were actually set on fire. Here the fact that there were no very serious results was perhaps more remarkable than in the case of the Grecian, since the building in which the scare took place had one of the most dan-

gerous faults which such a building can have in the fact that the doors all opened inwards—the general safety being due to the prompt action of the police in breaking them open from the outside. The terrible occurrence in a Brighton music-hall belongs strictly to another category, but bears only too plainly on the general question of supervision of theatres and music-halls. There was another alarm on the night before that at the Grecian, at a music-hall in Berlin. There the alarm was false, and was not apparently followed by serious results. It is, as we have said, satisfactory to note some of these cases, as regards the danger of panic; but the amount of this satisfaction is in no way a measure of the importance of reconsidering entirely the existing state of our own—to say nothing of other peoples'—theatres, music-halls, and places of assembly. Nor will cynical announcements as to the immunity for a long time of the public, and the deaths of a manager and a dresser, do anything to prevent the question being seriously thought of. In one important way some other people—and especially the Viennese—are far better off than we are in this matter. Their safety is now being looked after by a benevolent autocracy, and it is precisely autocracy in this respect that we want, and that we are practically without.

"This want cannot, perhaps, be more conveniently shown than by quoting the resolutions of the dramatic critics above referred to. They run thus:—"1. That the condition of many of the London theatres, both in regard to the stage and the auditory, in case of fire and panic, is extremely unsatisfactory and unsafe. 2. That the time has come for amending the laws that apply to theatres and places of amusement generally in the United Kingdom; and that it is highly necessary to appoint a Government official, to be held publicly responsible for the safety of theatres and places of amusement, and to be assisted by qualified inspectors." It might be desirable to include places of assembly with places of amusement, since, to take one instance, Exeter Hall might not, perhaps, be exactly defined as a place of amusement. Otherwise it is likely that the resolutions will commend themselves as being thoroughly to the point. The third and fourth resolutions are to the effect that, pending any new legislation, the control, as regards fire and alarm of fire, of theatres and public places, should be placed in the hands of the Chief of the Metropolitan Fire Brigade, and that "the Lord Chamberlain be invited to assist, as far as lies in his power, in the prevention of fire, or alarm of fire, in theatres." It seems to us as desirable a thing as can be that the resolution relating to Captain Shaw, who is of course the one person most fitted to deal with such matters, should, if there is no insuperable difficulty, be carried into effect as quickly as may be. But on this point it is to be observed that the Chief of the Metropolitan Fire Brigade is not a Government servant, but the representative of the Metropolitan Board of Works, or, in other words, of a large vestry. The resolution inviting the Lord Chamberlain's aid "as far as lies in his power" is, in a sense, unhappily significant. What lies in the Lord Chamberlain's power is to make the granting or renewal of a licence to most of the London theatres conditional on certain alterations or precautions which he thinks necessary being made or taken. He has not the power to inflict any penalty short of revoking or refusing a licence, and, in the case of a large theatre, revoking a licence means widespread ruin. Also this power can, practically, be exercised only once in every year. The Lord Chamberlain's Office attends minutely, and has for years past so attended, to the inspection of theatres without being in any way legally expected to do so; and some three years ago an Act of Parliament was passed, empowering the Board of Works to compel, for the purposes of public safety, any alterations of which the Lord Chamberlain might approve, in existing theatres and music-halls. The same Act provided that new theatres and music-halls should not be built without the combined sanction of the Lord Chamberlain and the Board of Works, no licence to be given without a certificate of safety from the Board of Works. Many people will be of opinion that the powers thus entrusted to the Board of Works and the Lord Chamberlain have not, at least as regards necessary alterations, been exercised with nearly enough stringency in two or three cases.

It is always more easy to point out faults or shortcomings in existing arrangements than to suggest an effectual remedy; but it seems to us tolerably obvious that what, amongst other things, is urgently wanted is the vesting in competent hands of a summary jurisdiction for inflicting penalties, substantial but not excessive, for every act of disregard or neglect of recommendations issuing from the Office of the Lord Chamberlain or of the Board of Works. It is, as we have said, a very serious step in most cases to refuse a licence; and it is not unnatural that managers, having undertaken to carry out certain recommendations, should sometimes delay, if not forget, them. Every such delay, however, involves a certain danger; and every such delay or neglect should be punishable according to its gravity. Another matter equally urgent, and perhaps more easy of immediate arrangement, is that fire-drill should be established in all theatres, and that the men told off to fire-duty should be from time to time exercised by unexpected calls to their several quarters and duties. This recommendation was, indeed, made by the Lord Chamberlain's Office in 1876; but, in considering it, it seems necessary to remember what was said by Captain Shaw in his very interesting pamphlet published in the same year, on "Fires in Theatres" (London: E. and F. N. Spon):—"By the term fireman here used it is to be understood a man trained and instructed in the business of extinguishing fires, and

not, as too commonly is found, a mere labourer, scene-shifter, or other subordinate assistant, clothed in a costume resembling a fireman's uniform." One other passage from the same pamphlet it seems at this moment especially desirable to call attention to:—"All doors for the entrance and exit of visitors should be made to open both ways, and should be of such light material that in any great emergency they could be forced open, even if closed and bolted." This possibility of instantaneous forcing should, we may add, be applied especially to all the doors which are inscribed with the words "Extra Exit." Too often it is found that these doors can only be unlocked by an attendant who is likely to be out of the way just when he is wanted, and too often, as we have on former occasions pointed out, the doors are not so much "Extra Exits" as extra openings on to a main corridor where a stream of people coming through them would strike on another stream coming from another direction. This particular matter seems to us the one of which the importance is least recognized by certain managers who have made, and continue to make, most commendable endeavours to minimize danger from fire or panic. Unluckily there will always be, while human nature remains what it is, managers of another sort, and it is to meet their cases particularly that further legislation is urgently needed.

Meanwhile it is an agreeable task to record the success of an experiment which has many advantages, among them the great one of reducing the risk from fire. We refer to the arrangements for lighting the stage of the Savoy Theatre by the incandescent electric light. The lamps used are those invented and manufactured by Mr. Swan, and the arrangements have been designed and carried out by Messrs. Siemens. The whole system seemed, when we saw it on Tuesday last, to be perfectly successful. About twelve hundred Swan's lamps are used for the whole house, and these are supplied with the current from a number of Siemens alternating-current machines, driven by two of Fowler's ploughing engines, of sixteen horsepower (nominal). The engineers in charge stated that they were developing about 120 horse-power; but our own observations give a result more favourable to the light, for at the time at which we examined the engines they were not developing more than 100 horse-power between them. Every possible form of stage light has been provided for, and the details of connecting and disconnecting the lights are beautifully managed—the process of putting up a light and connecting it to the main leads being far simpler and more expeditious than the equivalent process in the case of gas-lights. There is a well-designed system for throwing resistance into the different circuits, so as to vary the brilliancy of the lights, which has wisely been arranged to work from handles and dials almost the exact counterpart of those used for the same purpose for the ordinary gas service of a theatre. It is impossible to overstate the advantage of the new plan to all employed behind the scenes. Instead of an atmosphere of very high temperature, smelling strongly of gas, there is, under the system of electric lighting, hardly any rise of temperature, and no smell. The danger from fire is enormously reduced, as the lamps have not heat enough to set fire to anything; and there is also an absence of the source of danger from carrying about flexible tubes still containing gas. The dynamos used are, as we have said, of the alternating-current type; but, as their electro-motive force is only about thirty volts, we may safely say that neither danger to life nor risk of fire can be occasioned by their use.

#### THE ANARCHY IN IRELAND.

THERE is a tradition to the effect that nothing of importance happens at Christmas; but this tradition cannot be said to have been confirmed at the present time in reference to Ireland. The end of last week and the beginning of the present saw the adoption—late, indeed, but it is to be hoped not too late—of almost the first really businesslike plan for the suppression of disorder that the Government has undertaken since the proclamation of the Land League. The division of the most disturbed districts into five separate regions, each under the control of what may be called a resident magistrate with a roving commission, is an excellent idea, and it has been followed up by alterations in procedure which greatly facilitate the serving of writs, and by fresh proclamation of districts which will make the seizure of arms easier. Of three of the persons appointed to the new office little is known in England; but Mr. Blake and Mr. Cliford Lloyd have the highest possible reputation, and the latter at least has shown energy and ability which could hardly be surpassed. This arrangement, it need scarcely be said, affords a new and admirable opportunity for that combined attack on the no-renters which has been so long and so vainly recommended, and which now has the support of a characteristic and valuable, if not altogether encouraging, article by Mr. Mahaffy in the January number of the *Contemporary Review*. Every artifice of unscrupulous party zeal has been used in England by a certain section of the Liberal, or rather the Radical, party to prevent the collection of the funds necessary for this object; and these artifices have so far succeeded that the contributions to the Lord Mayor's Fund have as yet been few, and the amount, considering the large individual subscriptions of which it is made up, scanty. Mr. Gladstone's letter of Christmas Eve to the Lord Mayor ought, however, to defeat the plan of his too faithful followers. As to those followers, the most respectable of their

motives may perhaps best be put by a slight alteration of a sentence of their own. "It seems better to the rasher spirits of the Tory party that Ireland should be disturbed than that a Liberal Government should have the credit of its pacification." So, also, we suppose, it seems better to the rasher spirits of the Radical party that Ireland should be disturbed than that any doubt should be cast on the ability of a Liberal Government to pacify it. However, these recriminations—or, as Mr. Gladstone calls them, with rather unusual felicity, these "undiscriminating retaliations"—are not profitable; and the recent action of the Irish Executive has made a partnership between the Government and private enterprise perfectly possible. The most obvious way of carrying out this partnership would be the appointment by the Property Defence Association and the Lord Mayor's Committee of an agent to work with each of the new superiors of districts. That there is no time to be lost the ever-increasing reports of anarchy make but too clear. There is no exaggeration in the use of the word ever-increasing. If any one (even if he is what the Governor of the Bank of England calls a strong party man) will read the account of the outrage at Kilmallock, and of the deer-slaying near Clonmel, he will see that parts at least of Ireland are in a state to parallel which it is necessary to go back to the famous burning of châteaux and devastation of preserves in the early days of the French Revolution. Misrule of this kind never remains stationary in amount and degree. It is put a stop to sternly and promptly, or it grows. When, in connexion with these things, there is taken the wild Rights-of-Man doctrine about the soil, which is now being placarded all over Ireland with the name of a Roman Catholic Bishop at its foot, the urgent necessity of immediate action to show that there are such things as law and property must be evident.

The correspondence which has been published between Mr. Chamberlain and a country Dissenting minister is naturally of considerable interest in connexion both with the general question and with that of the tardy action of the Government. Even bitter partisans, much more contemplative lookers-on, must feel a certain commiseration for Mr. Chamberlain. His undoubted ability, and the great influence which, as the representative of the chief force which gained them office, he deservedly exercises with his colleagues, have not saved him from cutting but a scrry figure in this Irish matter. In its earlier stages Mr. Chamberlain pledged himself deeply against the notion of repressing the Irish movement; yet the Government has begun to repress, and Mr. Chamberlain is still one of its ornaments. Not long ago he attempted a defence of this position of his, which amounted, in the estimation of most critics, to a statement that he and the Government had been in favour of the movement so long as it played their game, and had turned against it when it became inconvenient. Mr. Chamberlain indeed, in this very letter to Mr. Page Hoops, speaks of this summary of his defence as a result of "the accustomed habit of misrepresentation of the Tories." He is to be complimented on using Mr. Bright's favourite formula periphrastically, and not in its original bluntness. But unfortunately the explanation which he himself proceeds to give simply repents, in language more comforting to his own self-esteem, the version of the misrepresenting Tories. This, however, is a question of bygones, necessarily more interesting to Mr. Chamberlain than to anybody else. It is satisfactory to find that the President of the Board of Trade has advanced even from his Liverpool position. The No-Rent Manifesto is "disgraceful." The privileges given to the Irish tenants are "more generous than those of any other country enjoy." "Acts of violence have multiplied," and "the time for the Government to act boldly and firmly has come." "It is the duty, and will be the object, of the Government to give all the protection from violence which the resources of the State can supply." "Nothing can be more fatal to democratic progress than an opinion, justified by facts, that Liberalism is powerless to protect the majority against anarchy and disorder, fostered by an irreconcilable minority." We might, if we were more anxious to criticize Mr. Chamberlain than to welcome an important and unexpected recruit to the banners of order, take exception to some of these phrases. There is, perhaps, a somewhat unlucky confession in that word "generous" applied to the benefits conferred on the Irish tenant. Parliament, we might have thought, should have been just before it was generous, and should not have been generous at all with other people's money, which Mr. Chamberlain implicitly confesses that it has been. The substitution of the fetish of democratic progress for good government, just laws, liberty, order, or something of that sort, is amusing, and so is the suggestion that, though Liberalism is quite willing to protect a majority from the violence of a minority, it would not consider it necessary to protect a minority from the violence of a majority. But all these things may pass. We shall be content with Mr. Chamberlain's admissions and disregard his reservations, or consider them only as enhancing the value of his submission to the principles of order. It is no light thing that the most extreme Radical in the Cabinet; the typical demagogue (uncomplimentary connotations apart) of the day; the man who has climbed highest in the shortest time by the aid of the principle that there is no political god but democratic progress, and that he himself is its favourite prophet; the representative of the party whose watchword is, "the devil take all order," should now, if only for a time, hold that the restoration and preservation of order is the chief duty and object of the Government of which he is a member. Two inferences, one

not very comforting, the other somewhat more so, may be drawn from this letter. The one is that the state of Ireland must be extraordinarily bad when even Mr. Chamberlain feels that he can no more afford, in Pym's language, to "encourage friends." The other is that the Government has at last awoke in earnest to the knowledge of the fact.

As usual, the Land Commission and its working supply not the least black spot in a sufficiently black prospect. Christmas has naturally served as an opportunity for retrospects of the action of the Commission hitherto, and the retrospect is sufficiently unsatisfactory. In the action of the superior Court there has indeed been little to find fault with, except the extraordinary imprudence of the legal Commissioner's opening promises. A difference of opinion, however, almost amounting to a dispute, which took place on the last day of sitting before Christmas, gave an unpleasant glimpse below the surface. It is difficult to conceive a more impudent application on the face of it than that which was made to the Court. A tenant who owed nearly five years' rent, against whom an ejectment decree had been taken out nearly two years ago, and to whom a whole year's further grace had then been given by his landlord before any attempt was made to put that decree in force, applied for extension of time to sell. One at least of the Commissioners was in favour of granting this request on the payment of two years' rent only. That, as Mr. Commissioner Vernon pointed out, such an application was merely making the Court an engine for deferring the payment of rent, is obvious enough. As a rule, however, the head Commission appears to have been guided by tolerably wise principles. It is to be wished that as much could be said for its impulsive subordinates. The so-called principles on which the Sub-Commissioners are said to have acted, after conference with their chiefs and Mr. Forster, are, it is to be hoped, apocryphal, and should certainly be inquired into as soon as Parliament meets. One of these principles, to fall back on Griffith's valuation in default of any distinct index of value, whether the rent had been raised or not, may be pronounced to be simply a gross breach of faith with the Houses of Parliament. It is tolerably certain that, if such a principle had been announced in the House of Commons, the Bill would have been shipwrecked; and it is perfectly certain that, had it got through, the majority would have been so small that the House of Lords would have been not only entitled, but bound, to reject it. Assuming the existence of a secret code of principles such as this, it is idle to talk of the Sub-Commissioners having been "pains-taking and impartial" in its application. Similar pains-taking certainly, and similar impartiality, in so far as that word is applicable at all, may be found in the annals of the Inquisition or the Star Chamber. It is not difficult to be impartial in applying a code which has been arranged beforehand so as to favour one side only. It is to be hoped that more credence may be given to a contradiction of the statement, incredible in itself, that the Superior Court would not re-examine questions of fact. The appointment of competent surveyors to enable it to do so is the only thing that will give Englishmen confidence in the working of the Commission. It is true that there remains the practical difficulty of the time required to get through the cases, but this is a matter on which it is somewhat needless to comment. The country has deliberately undertaken the task of revising the rental-book of Ireland, and the country must provide the means of doing it. Considering the amount of English money which is already lavished on Ireland, the expense of some scores of Land Commissioners is no such great matter. The methods and principles upon which these Commissioners could proceed supply a far different question. It may be confidently asserted that, if those methods and principles are such as they are stated to be, and such as appears from the actual conduct of the sub-Courts, the business is not, and cannot come to, good. If it was intended that Parliament should pass a measure giving the actual tenant-farmers of Ireland their lands at what Griffith's valuation demonstrably is, a rent from fifteen to thirty per cent. under the fair letting value, the proposal should have been honestly and openly made to it.

#### DANCING MEN.

THERE is a time at which even lions are out of season. When country balls are at their height, and people are driving many miles in the dark at the period of the year which is of all others the most unsuited for going out at night, a London lion is as unseasonable in a country house as a Tay salmon. During the London season and the autumn visits at country houses celebrities are eagerly sought after; but when the ball season begins, mind has to give way to matter, intellect is at a discount, and legs are at a premium; authors, politicians, and generalissimos are nobodies in comparison with dancing undergraduates, under-secretaries, and subalterns; while the only use of music is for waltzes and gallops. Dancing men may almost be said to come into season with oysters, and so long as they are seasonable, they have no rivals in point of marketable value. The causes of the demand for this special commodity are by no means obscure. During the winter months everything in the country has to give way to balls. From May to July people are supposed to be in London; during August and September they profess to be in Scotland; and from Ash Wednesday to Easter they are understood to be better employed; so the only period left free for local English balls is from Michaelmas

to the beginning of Lent, and at that season every week is overcrowded with these entertainments. Now, even if we were to allow that in English families there are as many boys as girls, it would be obvious that there must be a deficiency of dancing men. In most large families one or two boys are abroad, either with their regiments or in houses of business; and those that are employed in their own country cannot all get their holidays at once. The daughters, on the contrary, remain at home, and the local balls are their great annual festivals. But we may go further and say that, even if there were to be an equal number of young men and young women at home in English country houses, there would still be a great deficiency of dancing men; for while a stigma is attached to a girl if she is not asked to dance almost every dance during a ball, there is no kind of discredit to the lazy youth who stands with a crowd of other drones blocking up the doorway, or sits in the supper-room gossiping with his fellow-men. It cannot, therefore, be a matter for surprise that during the winter months men who can and will dance should be at a fabulous premium, nor may it be altogether superfluous to add that they are fully aware of their value. Whatever may be the tastes of the occupiers of country houses, if they have daughters, or if they wish to act up to the conventional standard of rural hospitality, they are obliged to allow, and even to court, the presence of a horde of young fellows with whom, in nine cases out of ten, they have scarcely an idea in common.

To the difficulty of procuring dancing men at the height of the local ball season dwellers in country seats can amply testify. Necessary as they are at their own special season, dancing men do not occupy one's thoughts at other times, and it would be hard indeed to be required to toady every tolerable youth that one met with because he might be useful at one or other of the balls that take place in the short country ball season on either side of Christmas. Yet the host who neglects to cultivate the acquaintance of young fellows between eighteen and thirty has to lament his indiscretion and idleness during December and January. Readers of *Punch* have often laughed at the exertions of Mr. and Mrs. Ponsonby de Tomkyns to secure celebrities as their guests, but their labours are as child's play compared with those of ordinary country hosts and hostesses to secure dancing men. After all, Mrs. Ponsonby de Tomkyns flies at high game, whereas the country gentleman is obliged to content himself with any passable small fry that can dance *trois temps*. The announcement that a neighbouring ball is appointed for a certain night is enough to make the heart of the bravest of hosts to quail. He knows from bitter experience the troubles that await him. Dancing men are so fully aware of their own value at this time of year that they are in no hurry to answer invitations. They wait until they have plenty to choose from, and then select the most tempting offers, telling falsehoods to the donors of the others. Even if dancing youths did not deliberately wait their own time before answering their invitations, there would inevitably be some delay in their replies; for, when men are moving about from house to house, staying two nights here and one night there, their letters follow them about in a vague and uncertain manner. The facility with which men make excuses, when their invitations are not exactly to their liking, is amazing. They say that they have promised to go elsewhere, when they are as free as the winds; that they don't think they will be able to get leave, when they know that their long leave will be scarcely half exhausted; and that they have uncles or aunts seriously ill, when those respectable relations are in the enjoyment of rude health. Even after they have accepted invitations, they will slip out of them if something better turns up. It was so stupid of them, but when they accepted our kind invitation, they quite forgot that they had already engaged themselves to the Duke of Cambrin; or they had fancied that the 22nd was a Thursday instead of a Wednesday, and, as they had promised a month ago to go to Lady Fibster's on the Thursday of that particular week, it would be quite impossible to come to Shortrent Castle on that day, although they had promised to go there on the 22nd, imagining that day to be the Wednesday.

When a sufficient number of dancing men have been with difficulty engaged, the troubles of the host are by no means ended. The chances are, that when the day of their advent arrives, half of them will arrange to come by trains enabling them to reach the house to which they are destined about three o'clock, while the other half can by no possibility appear before eight. The first division will sit speechless in arm-chairs throughout the afternoon, refusing to be comforted, evidently cursing their bitter fate. The train conveying the second division is pretty certain to be late, and it is likely enough that a mistake will have been made about a fly that has been ordered to meet them. When the party at last sits down to a spoiled dinner, an hour after its appointed time, one half of the guests will be mentally grumbling at having been kept waiting in the most unjustifiable manner, while the rest will consider that they have been very cruelly hustled and hurried in their toilet, to say nothing of the hardships of their journey. Even if all preliminaries have gone smoothly, dancing men are not, generally speaking, the most entertaining of guests. They are deeply conscious of the obligation under which they are putting their host, and they act accordingly. They will sometimes—though not always—allow themselves to be amused; but they will on no consideration amuse themselves to amuse others. That is the exclusive business of the "funny man," and if the host has not engaged the "funny man," so much the worse for the host. They

have only come to dance, and they are as averse to doing anything for which they were not hired as the most cantankerous of modern servants. They will take good shooting as a perquisite; but nothing will induce them to shoot if they have any suspicion that their doing so may be useful. Their manner of passing the day is much as follows. Just as the ordinary mortals of the party are leaving the breakfast-room, the first of the dancing men appears, to be followed at intervals of a quarter of an hour by others. When they have finished their breakfasts, they light cigarettes in the hall, making the house reek of tobacco. They then go out to make a few meteorological observations, leaving the front door wide open behind them. Having torn up some envelopes and thrown them on the gravel in front of the house, they come into the hall with muddy boots, and assemble round the fire, to spend the morning in silently pulling to pieces the journals and the illustrated newspapers, and scattering them in all directions. Generally speaking, they take no apparent interest in the young ladies until the evening. They are capital hands at luncheon; and, as soon as that meal is over, they begin to smoke again. One or two of them may perhaps take a stroll, but most of them will probably spend their afternoon alternately sleeping and smoking in arm-chairs or on sofas in the smoking-room and study. From tea-time till the dressing-gong is sounded they will sit moodily in the library, snoozing or gazing dreamily at the ladies; they will be late for dinner, and after that meal they will expect to be allowed to smoke cigarettes in the dining-room.

When you have safely marshalled your troop of dancing men into a ball-room, you may justly indulge in some feelings of pride. You are not as other men are, with half a dozen daughters crowding round one hobbledchoy. You have not only as many dancing men as girls, but more also who may be spared for those who are in want; so you look upon yourself in the light of a public benefactor. In a few minutes all the young ladies of your party, and all the married ones under, if not over, fifty, are whirling happily round the room in the arms of your dancing men. Even some of your neighbours' superfluous damsels are waltzing away in perfect contentment, thanks to your provision of dancers, and you proudly reflect that you have your reward. In an hour or so you are surprised to observe that some of the young ladies of your own party are not dancing, and you immediately look around for the dancing men. A couple of them are standing in a doorway, and when asked why they are not dancing, they answer that they have already danced; if introductions are offered, they reply that they will ask for them later on. Three of the troop are "sitting out"—a popular process, which is conventionally understood to be sacred from disturbance. The best dancer of the lot has foregathered with a beautiful married woman, with whom he pirouettes or sits out for the rest of the ball, and several have busily deserted you and yours and attached themselves to the parties of those that are "greater than thou." At supper-time things get worse still. It is true that when the doors of the supper-room are first opened, the dancers take the opportunity of the comparative emptiness of the ball-room to get a good waltz; but as soon as the greater number of the ladies have been duly fed, the dancing men go down in a body and make little groups in the supper-room. There they deliberately sit, gossiping and chaffing, utterly oblivious of the rows of forlorn maidens that are being piped unto without being able to dance, in the ball-room upstairs. The host will probably find that one or two of his dancing men will be the first people to make inquiries about the return home, and to say that they are quite ready when he is. Several will apparently have struck work altogether, and all will profess readiness to depart. Their weary host will then order his carriages with a light heart; but just when they are drawn up at the door, the ball-room will be no longer crowded, and the dancing men, observing that there is now plenty of room to dance, will set to work with all their energies. Sailing up and down the room with nothing to impede their progress, those who really care for dancing are now able thoroughly to enjoy themselves; and as to keeping the carriages waiting, if Iroquois and Foxhall themselves were standing at the door in double-harness, the dancers would not leave the ball a moment sooner than they liked. The happy host, who congratulated himself so much on entering the room with his phalanx of dancing men, may now make up his mind to kick his heels in the doorway for another hour and a half, while his closely-singed horses shiver in the rain or snow between three or four o'clock on a December or January morning. When at last the tired host has succeeded in taking his dancing youths home, and half an hour has been spent on a final supper in his own dining-room, he will be expected to lead them to the smoking-room and entertain them for an hour or so. They are now more inclined to be talkative and agreeable than they have been since they entered his house. As his principal guests left the ball early and intend breakfasting in good time, and leaving his house at about half-past nine, he will have to be up sometimes himself to entertain them at breakfast and bid them farewell, so the smoking-room arrangement leaves him about an hour and a half for sleep. All hospitable people are supposed to heave a sigh when their guests depart, but to some men perhaps the most distressing moment of the year is not that at which the last of a party of dancing men drives away from their doors.

## THE STATE OF THE ARMY.

AMONG the numerous stock-takings, to use a convenient piece of commercial slang which the end of the year naturally suggests, not the least important is a consideration of the actual state of the army. There are, perhaps, few subjects in which the interest of the few and the interest of the many are and have always been so disproportionate in England. Army reform has been a hobby, a craze, a study; but it has never yet been a subject of general attention, and it has, doubtless most unfortunately, been usually decided if not debated on altogether irrelevant grounds. Nothing on the face of it ought to stand more aloof from politics or personal matters than the question of the efficiency of the national defences; not many things have in practice been more dependent on political and personal considerations. It has, indeed, seemed almost impossible that any question affecting the army should be discussed without importing into it considerations of this sort. Long service and short service, brigade depôts and territorial regiments, undertrained soldiers and under-educated officers, are things and persons the discussion of which or of whom ought to be, it would seem, left to experts on one side and persons of common sense on the other. As a matter of fact, they have been mixed up with a crowd of other matters, in which there is no such thing as *expertise*, and in which party and personal bitterness, and not common sense, is the chief motive of action. There may be many opinions about the character and conduct of the various persons whose conduct and character have been so freely criticized of late in the squabble about the appointment of Adjutant-General. There can, among impartial judges, be hardly more than one opinion as to the spirit which has been displayed by the partisans of the successful candidate.

In a very different spirit from this it is possible and desirable to review the actual state of the English army. The edifice of the army reformers has been very nearly, if not actually, crowned, not merely by the appointment of their favourite champion to the post of greatest practical authority in the whole military establishment, but by the apparently final adoption of short service, very slightly tempered by long, and of an elaborate system of many-battalioned regiments, arranged so that the battalions at home feed the battalions abroad. The childish freaks which have been played with the nomenclature of the army have been perhaps too much insisted on; for they cannot be considered an integral part of the system, but rather an example of the same curious folly which has made army administrators at one time pin their faith on pigeons, and at another sacrifice everything to the horsing of a cavalry regiment with steeds of the same colour. As an additional cause of disgust to a service not too contented with its treatment already, the thing may be regretted; but it is not too late, and will not be too late, to change it whenever some one less fond of playing with counters than Mr. Childers, or less anxious to make his mark on the army in outward things than Sir Garnet Wolseley, makes his appearance. The real changes are those which have been mentioned, and they are in reality only a fresh shuffling of the cards with which we have been playing for ten years. Territorial regiments succeed linked battalions; short service with a permissive alleviation succeeds short service which, owing to the fact that previous arrangements had not expired, still provided a certain number of seasoned and experienced soldiers. But the new developments are only varieties of the old, and as such may be said to fix them as permanent features of our military system. Discouragement of long service, large regiments separated into active and feeding battalions, and a greater insistence on professional and non-professional education in officers, may be said to be the characteristics of the English army in 1881 as distinguished from the English army twenty years ago. Perhaps we should add the reserve system; but as this exists chiefly on paper, and as the results of applying it under the late Government were only partially encouraging, it may not be wise to dwell too much on it.

The returns which have been published, as usual nearly a year after date, but *à propos* for all that, of the state of the army in 1880, and the actual history of the last twelve months or so, supply the tests of this system which, as has been pointed out, has been altered recently rather in form than in fact. But to consider these facts with any profit it is necessary to have tolerably clearly before us some idea of what an army ought to be. It ought to be sufficiently numerous; it ought to be thoroughly equipped; it ought to be organized so as to be able with the least possible friction in delay and expense to be placed where it is wanted; it ought to be capably officered; it ought to be well disciplined; it ought to know how to use its fighting tools and its working ones; it ought to be composed of men individually fit for any work likely to be imposed on them. Now, in regard to equipment and, in the main, to discipline, it is pretty generally acknowledged that there is no great fault to be found with the army. If its discipline has on occasions left something to desire, that is closely connected with another and a very different failing. As to mere numbers, again, it may be a question whether the army is sufficient for the immense work it has to do; but that, to speak paradoxically in appearance, is not a question of army efficiency. What our military system has to do is simply to provide the number of men which our political rulers think fit to ask from it, and if it does this there is no more to be said. It has done this for some years now, and it did not do it for some years before the establishment of short ser-

vice, which is perhaps the only unquestionable feather in the cap of that much-debated institution. That there have been wars and rumours of wars of late, which always bring recruits, and a bad labour market, which also naturally encourages recruiting, must of course be taken into consideration, but still the fact remains. As for the acquaintance of the army with its tools, the answer must, it is to be feared, be an unfavourable one. It appears that army reformers do not busy themselves much with that point. The capability of the holder of a commission under present circumstances, as compared with the old purchase officer, is one of the problems which it is almost impossible to settle. Whether as much has been lost in *moral* as has been gained in mere book-learning is one of those propositions which not ten men in a nation are qualified to decide by knowledge, while probably eight out of the possible nine are disqualified by a fixed opinion one way or the other beforehand. That the devices necessary under the new system to prevent an utter stagnation of promotion have acted injuriously on the army and expensively to the nation, by removing forcibly many excellent and willing officers, seems indisputable. But what may for shortness be called the new system concentrates itself for the most part on the provision of men, and the main question is whether it effects this provision. It may be admitted that after a fashion it does effect it—at the expense of the individual fitness of the persons supplied, and by a clumsy, expensive, and injurious organization. As for the first point, it has been settled—as far as short service pure and simple is concerned—in the minds of all but partisans by the famous City speech of Sir Frederick Roberts. When the only living English general who has recently and successfully conducted extensive and difficult operations in the field under the conditions of ordinary war, and not under those of a costly promenade lavishly supplied and organized at leisure from home, declares that his long-service regiments, and those alone, were really fit for work in the field, there is no more to be said; at least, subsequent words are but the vain breath of theorists unwilling to abandon their theory.

It is true that some concession has since been made to Sir Frederick Roberts's views, and that in a kind of grudging and underhand way old soldiers who wish to serve their country in the places where none but old soldiers can effectually serve it are permitted to do so. But the problem of the double debt which the home army has to pay—the debt of supplying the ordinary needs of the army abroad either by drafts or by relief, and the debt of being ready to act independently on any sudden emergency—remains altogether unsolved. We are told with triumph that there are eight strong battalions ready to go anywhere and do anything. But it is admitted immediately afterwards, with something very different from triumph, that this happy state of things has been accomplished only by the transfer of men from other regiments—a practice which, from the point of view of a critic of army administration, is really not much more innocent than paying dividends out of capital in the view of a bankruptcy judge. Such a proceeding, too, is especially ludicrous as well as especially blameworthy in the midst of the actual potholes about territorial regiments. If tradition, *esprit de corps*, everything, is to be sacrificed to the making of the regiment into a perfect, self-sufficient, living unit, what is the sense of making certain unlucky regiments mere store cattle for the provision of the materials of an enlarged Talmection operation? A cry is made for the increase of home establishments—a cry against which there is nothing to say in itself. But it simply means an increase of the army, and it would be more honest to state it in these terms. We certainly cannot afford to diminish the army we have abroad. India has not a man it can safely spare in the opinion of the best judges. The restoration of the garrisons of Malta and Gibraltar to something more than skeleton condition is one of the things on which army reformers most pride themselves; and certainly their full nominal establishment cannot be said to include a man too many. But putting the Indian and Mediterranean establishments aside, there is nothing left but a few meagre garrisons, which could by no possibility be reduced in number or in strength without danger. We have no longer, as we once had, regiments vegetating about the colonies which might as well or better be at home. An increase of the home establishment therefore means a substantive increase of the army from 190,000 men, as it is in round numbers—and considering the enormous difficulty we have to get ten or fifteen thousand together, it may astonish some people to hear that we have so many—to 200,000 or 210,000, or whatever may be needful. The demand therefore amounts to a simple confession on the part of warm advocates of short service that that famous panacea is not a panacea after all; that the most elaborate process of shuffling and of nomenclature will not make one boy of nineteen do the work of two men of thirty, and that we must recognize the fact. This of itself is a gain, not as an argument against short service, which none but fanatics regard as either good or bad in itself, but as an approach to rational treatment of the subject. On the day when a savage throws away his amulets or a highly civilized person puts his patent medicine bottles in the dustbin, each has at any rate made the first step towards getting himself thoroughly cured of his disease, if it be curable. "More men for England and more officers for India" would make as good a cry—to say the least of it—as another in the matter of army reform.

## STRANGE MARRIAGE CUSTOMS.

THE writer of a very interesting article in the *Times* has been discussing some Egyptian discoveries not less curious than that of the mummy of Ramses II. That "find" was singular enough in itself. For some time the Arab dealers in antiquities have been unusually well supplied, and it was known beyond conjecture that they had lighted on some hidden treasure. One dealer is said to have offered an English traveller half the loot if the traveller would give him the other half and 1,000*l.*, and see that the whole mass was safely conveyed out of the country. It was a great opportunity for a man who had no conscience; but our traveller had a conscience, and had not the other conditions necessary for success. In the end the Arab was arrested, was probably bastinadoed, and revealed the secret cleft in the rock where the treasures, manuscripts, and mummies of the Pharaohs had been concealed for more than three thousand years. But all this has little enough to do with the recent discoveries of M. Revillout, the Egyptologist—discoveries not so fresh but that they are referred to in the *Encyclopædia Britannica* under the head of "Family." They were made, not in caverns of the hills, but in the Demotic papyri of the French and other national collections. The Demotic writing, as most people know, is an abbreviated form of the Hieratic, which, again, is a cursive form of the hieroglyphic. The Demotic hand is thus much the most modern form of old Egyptian. Documents in those texts often belong to the time of the Ptolemies, when holy Egypt had long been invaded by all manner of Western and Asiatic peoples and ideas. The texts deciphered by M. Revillout are just like those which would be found in the cabinet of any French notary. Old-established firms in France still preserve marriage contracts and similar documents of very considerable age; they are the happy hunting-grounds of French biographers; and from dusty garrets M. Soulié, for example, rescued the precious inventories that minutely describe the domestic interior of Molière. M. Revillout's discoveries in the same way enable him to reconstruct the domestic life of the Egyptians of late dynasties. We propose now to glance at the holy state of matrimony as it was in late Egypt, and to elucidate, if possible, a very singular feature in Egyptian law which appears to have puzzled the exponent of Egyptian ideas in the *Times*. We refer to the predominance of the wife in the family—a predominance insured by the most stringent of marriage settlements. Thus, in the thirty-third year of Ptolemy Philadelphus, we find that the Ptolemy of Amen Api, son of Ptolemy, whose mother is Tahret, saith unto the woman Tarrateus, daughter of Relon, whose mother is Tarrateus, "I have accepted thee for my wife." Note here, first, the naming of the mothers of both contracting parties—a fact which in itself demonstrates the importance of the woman in the family, and is a survival of a time when (as among so many savage races, among the Lycians, and the prehistoric Athenians) family names were derived, not from the father, but from the mother. First the man says, "I have accepted thee," and, later, adds, "I will establish thee as my wife." The preliminary "acceptance" was a marriage for a year of probation, like the "hand-fasting" for a year, with power at the end of the year to break the contract, which used to prevail among the Highlanders in Scotland. Certain German usages, and some other customs of the same dubious sort, are perhaps relics of the same old practice. After accepting and establishing the woman as his wife, the man makes her a nuptial gift, a promise of an annual allowance for dress, a declaration that the eldest son of both shall inherit all his property, a promise to pay certain damages if he takes another wife, and, last, a guarantee in the form of a mortgage upon all his property. Another example is quoted in which one Petonpu assigns to his wife, Neshorpehrat, "not only his house and all his landed property, present and future, but likewise his silver and copper money, his furniture, and all the title-deeds and documents concerning his property. . . . He leaves himself absolutely nothing"; and the only clause in his favour is that his wife shall provide for him while he lives, and pay for his funeral liturgies, and for embalming his body when he dies. And this is not a singular instance. Still more remarkable, the Egyptian bridegroom took his wife's name, and Egyptian sons, "instead of being called after their fathers, were designated by the names of their mothers."

This state of things seems absolutely incomprehensible to the writer in the *Times*. "We shall probably never know," he says, "how customs so strange and perverse came to be established among a people famed throughout antiquity for their wisdom and learning." Here we must remind the reader that the Egyptians were also famed for another very extraordinary custom—their worship of animals. We propose to show that the two customs—the predominance of women and the worship of animals—are, in all probability, connected, and help to account for each other. The conjecture of the writer in the *Times* is that the laws may have arisen from the old unequal marriages between the daughters of the Pharaohs and simple country gentlemen. But surely this is an inadequate explanation of an "old law" of universal application, and of customs which, as we shall see, have, in varying degrees, been found in every wide distribution. To return to our own theory—the worship of Egypt has generally been explained by students of history as symbolical. There is a passion at present for the idea that all polytheisms are monotheism in disguise, and this idea is favoured by the tendency of the learned

and mystic Egyptian priesthood to explain away their own religious peculiarities as mere allegories and emblems. Thus people argue that the Egyptians worshipped goats, sheep, bulls, frogs, and what not, merely as types of one or other attribute of the Deity. But the facts are inconsistent with this hypothesis. Every Egyptian did not worship every animal. The animals were local gods. Memphis had her bull, Iscot her wolf, Edfo her hawk, Mendes her goat, and so on. The neighbours of each city were so far from adoring the animal sacred in that town that they often persecuted it. Again, the people of no city would destroy the animal it worshipped, except, in some cases, once a year, when the people of Thebes, for example, would sacrifice a ram, an animal sacred through all the rest of the year. Here we have a precise parallel to the manners of the Acagchemens of California, who adore the buzzard, but sacrifice him on one day of the year, with tokens of grief and public lamentation. The people of Lycopolis in Egypt permitted themselves to eat sheep, because they were the wolf's people, and the wolf does eat sheep. The Theban kings derived their origin from their own Ram-god, and were consequently sheep, or of the stock of the sheep. All these peculiarities, like the extraordinary marriage ceremonies, were a mystery and a laughing-stock to Greece and Rome. Every one remembers how Juvenal mocks the gods that grow in gardens. Plutarch observes that it is all very well to give the gods sacred beasts for companions—the Greeks did as much; but that it is an extraordinary caprice which makes the Egyptians actually worship beasts.

All this seems very remote from any explanation of the Egyptian marriage customs. But we bring the religious and the legal phenomena together thus; there is scarcely a quarter of the globe where the tribes of contemporary savages are not divided into stocks, each of which, like the Egyptians, reveres a separate animal or plant, from which, like the Egyptian towns, it is named, and (as the Egyptian worshippers also did) it refuses to eat that plant or animal. Further—and this is the essential point of our explanation—among the tribes which act thus the mother is the permanent element in the family, and the children (as the Egyptians did) derive their names, not from the father, but from the mother's family. It is true that the woman does not hold the same command over what property there may be as she did in Egypt. But we think that the facts we have mentioned are enough to suggest that the Egyptians retained, long after Greek civilization had reached them, two absolutely savage practices—the worship of plants and animals by separate human stocks, and the derivation of family names from the mother. It is impossible here, and it is perhaps superfluous, to give long lists of the races which practise customs akin to those of the Egyptians. It may be enough to say that the whole of the tribes of the North American continent do so, with local variations; that the Australians are in the same condition, as are the Basutos, Damaras, and other African races. In these cases it is to be observed that the various stocks which worship the various animals are scattered through all the local tribes. But in China the worshippers of each animal, or at least the people who derive their name from him, are gathered together, as in Egypt, into local aggregates. In one district will be found, perhaps, three villages, each containing two or three thousand people, one of the Horse, another of the Sheep, another of the Ox family name. Persons of the same family name may not intermarry. Those extremely Aryan people, the Brahmans of India, may not intermarry within the *ghatra*, and, at least in some cases, the name of the *ghatra* is that of an animal. The latest survival of this rule is found among the Greeks, where a man might marry his sister by the father's side, but not by the mother's, which seems as if he and his mother had once been reckoned of the same kin, while, apparently, his father had been of another kin.

If we are right in our inference, the Egyptian marriage customs and the Egyptian animal-worship are both relics of savagery, preserved into the midst of civilization by the extraordinary tenacity of Egyptian conservatism. The marriage custom, therefore, requires no singular explanation, like that which derives it from the marriages of the daughters of the Pharaohs. It is only the form which the important position of the mother—a position originally secured when the wisest child knew not who his father was—assumed as society became wealthier and more polished. Similar examples are the fact reported by Strabo, that among the Iberians women were heads of families, the commanding position held by women in the Finnish Kalevala, and the ancient *coutume* of Basège, by which Basque women inherited property to the exclusion of males as late as the eighteenth century. The Etruscans, like the Egyptians, took their name from the mother's side. In Campania there were local customs by which descent was reckoned through the mother. Thus, on the whole, the Egyptian practices are remarkable, not for their singularity so much as for their late persistence, which only yielded very slowly to the influence of Greece. Probably the peculiarities of Egyptian religion will be better understood when writers recognize that these, too, are but elaborate survivals of a savage past far behind the most ancient dynasties. This survival makes it less surprising that far fainter traces of savagery remain in the language and religion of Greece, even though the Aryan ancestors of the Greeks were, as the philologists tell us, essentially civilized before an Aryan word was spoken in Hellas.

## YACHTING AND YACHTING RULES.

THE yacht-racing season of the expiring year opened in a decidedly unpleasant fashion. Distracted for long by various sets of rules and systems of measurement, the yacht-owners at last united, with but few exceptions, and determined that they would not allow their vessels to sail in any match which was not conducted under the rules of the Yacht Racing Association, and it was, of course, implied in this resolution that the Association's system of measurement would alone be recognized. We pointed out at the time that, in taking this course, the yacht-owners were fully justified, and indeed they would have shown great weakness if they had allowed the confusion which prevailed before last season to continue any longer. It is, no doubt, painful to see the most delightful of sports disturbed by controversy, and to hear the hideous word "boycotted" used in connexion with yacht-racing; but even in matters of sport it is sometimes necessary to show firmness, and the yacht-owners had perhaps carried patience and forbearance too far before they at last determined on common action. In the hope that the Clubs would institute some joint reform, they were content for long to submit to various codes, some of them containing extremely vexatious rules, and to sail under at least four different systems of measurement. When it became clear that no reform was to be expected from the Clubs, the owners united in self-defence, and certainly this measure was not taken a whit too soon. When taken, however, it was firmly carried out, and very shortly the results of common action were apparent. As need hardly be said the yacht-racing season opens with the regattas of the Royal Thames, the New Thames, and the Royal London Yacht Clubs. The last-named, which is the most enterprising and liberal of the Metropolitan Clubs, has from the first adopted the Y.R.A. rules, and therefore no question arose between it and the owners. With the others the case was different. No effort was made to meet a perfectly reasonable demand, and the consequence was soon made manifest in the list of entries for the New Thames and Royal Thames matches. This disagreeable state of things was seemingly borne with equanimity by the Committee of the younger Club, but occasioned considerable annoyance to that of the older and more famous institution. Anxious that real racers should contend in the great match from the Nore to Dover, the Committee entered into negotiations with one of the yacht-owners, and finally an official letter was written by the secretary on behalf of the Committee, in which, after explaining that no change in the rules could be made without the consent of the members at a general meeting, and that the annual general meeting had already been held, he went on to say that "the principal object of the Royal Thames Yacht Club being the encouragement and promotion of yacht-sailing, keeping in view the wishes and convenience of yacht-owners, the Committee undertakes to consider favourably before next season the views of owners, and to accede to their wishes unless there should be some cogent reason for their not doing so." On the strength of this promise vessels were entered for the Nore to Dover race, which, as those who took part in or witnessed it are likely long to remember, was one of the finest ever sailed even over that course.

The time is now approaching when the engagement which the Committee entered into will have to be carried out or repudiated; and, in order, we presume, not to keep the yachting world too long in suspense, the Committee has given an intimation of the manner in which its promise is to be kept. At least we suppose that the remarkable circular which has been published was really written by the Secretary and sanctioned by the Committee of the R.T.Y.C., as it has been commented on in two papers and has not been repudiated. Such being the case, it certainly demands attention. It need hardly be pointed out that this is not a private question, and that it is quite different from an ordinary club dispute. The undertaking given by the Committee and the circular have both been published. The Royal Thames is often spoken of as the premier yacht club, and may be considered as a public body so far as regards yacht-racing. Whether a justly admired national sport is to be embittered, and even discredited, by the continuance of a painful dispute, or whether this is to be terminated by wise concession, depends now to a great extent on the course taken by that Club. No apology is therefore needed for considering the question and for examining the circular which defines seemingly the position taken by the Committee in this matter. The document begins with a statement that the Committee "still bear in mind the assurance that they gave in May last to racing owners, to the effect that they would favourably entertain any proposals for amendments in the laws which would further the convenience and interest of yacht-owners"; and the recipients of the circular are invited to offer any suggestions they may think fit. Now this is very obliging of the Committee, and it is also very obliging of them actually to remember a promise which they gave seven months ago; but unluckily this effort of memory seems to have exhausted them, and though they are so thoughtful as to recollect having made a promise, they are not so careful as to remember rightly what that promise was. As has been shown, they said, through their secretary, not merely that they would "consider favourably" the views of the yacht-owners, but also that they would "accede to their wishes, unless there should be some cogent reason for their not doing so;" but, by some extraordinary mischance, these latter words appear to have escaped their memory. After the preamble, which is thus unfortunately a little misleading, the Committee go on to state their views, and we think it best to

give them *verbatim*, as otherwise it may scarcely be possible to avoid the suspicion of misrepresentation. They say:—"Various influences have been used from time to time to induce the Committee to advise the adoption, in their entirety, of the rules of the Yacht Racing Association, but it appears to the Committee that several of those rules are ill adapted for river-sailing matches; and, moreover, the Association are constantly altering their rules. The sailing laws of the Royal Thames Yacht Club, following, as they have, the progress of yacht building and sailing, are the product of the successful experience of more than half a century; and the Committee, as an executive body annually appointed, would not themselves be justified in recommending that such laws should be sacrificed to a set of rules not five years old, and which can hardly be deemed satisfactory, judging from the various alterations in them which the Association are constantly making, such, for instance, as the rule of measurement." "However, if, in response to this circular, it appears to be the wish of the majority of the Club that the rules of the Yacht Racing Association should be adopted, either partially or in their entirety, the Committee will be prepared, at the annual general meeting, to submit a resolution to that effect, and to take the sense of the meeting on the question."

It would not be an easy task to determine which of these strange assertions is the least worthy of attention. The most ardent student of yachting rules who pores over those of the R.T.Y.C. and of the Y.R.A. will be, we venture to say, at his wit's end to discover why the code of the latter is unsuited for river-sailing. The statement with regard to the respective ages of the two codes is much like saying that the old rules of the road at sea were better than the present ones because the former embodied the experience of many years, while the latter are only some two years old. Every one who is at all conversant with yachting matters knows that the Y.R.A. rules were drawn up by men of very large experience, and were based partly on that experience and partly on the most valuable parts of the Club codes. The assertion that the Association is constantly altering its rules seems exaggerated, but it is certainly true that some important changes have been made of late years. Had it been otherwise, the Y.R.A. would not have deserved or obtained the confidence of yachtsmen. They did not fondly consider that their work was absolutely unimpeachable. The united wisdom of the country can rarely succeed in framing a statute which is not found to work badly in some respects, and it was hardly to be expected that the Association would be able to devise a perfect set of rules. When one of their ordinances was shown to be insufficient, they were willing to amend it, or, in other words, they adapted their legislation to the needs of the time. From the statement in the Committee's letter it might be gathered that they take a Chinese view of their own regulations, and regard them as perfect and not to be improved; but, as a matter of fact, they are not so prejudiced as they appear from their letter to be, and are perfectly well aware that rules require alteration from time to time. As has been pointed out in one paper, the letter itself shows that the Club code is about to undergo its "usual revision," and it has been altered within a comparatively recent period. The changes in the rule of measurement were made by the Y.R.A. because they were clearly shown to be absolutely necessary, and it is not a little astonishing that the Committee should feebly gibe at them; but, as they seem to have forgotten their own undertaking, they may not now remember the facts which led to the adoption of these alterations.

When the memory of these facts returns to the Committee, we trust they will see that their circular has been a great mistake, and that the best thing they can do is to follow the example of the best and most able commanders, and promptly to abandon an utterly untenable position. The Y.R.A. is not an inflexible body, and its rules are, no doubt, open to criticism, but hardly to such criticism as that of the Committee, which appears to us to be frivolous, not to say childish. In the letter from which we have quoted the Committee promised to do what was desired unless there were "cogent reasons" against doing so. They must have known that the yacht-owners wished for the Y.R.A. rules, and it can hardly be maintained that any "cogent reasons" against accepting those rules now exist which did not exist at the time when that letter was penned. It will hardly be said that the Committee, while allowing the letter to be written, were convinced that there were conclusive reasons against accepting the code of the Association. This would have been a mental reservation of a very peculiar kind; but, if there was not some such reservation—and it is quite impossible to suppose that there was—the Committee ought now to redeem their word; and they can hardly be said to do so by a conditional promise to submit the code for acceptance after showing as clearly as they can that, in their opinion, it ought not to be accepted by the Club. It can hardly be doubted that, on consideration, the impropriety of such a course will be obvious, and that the body which is presided over by the Prince of Wales—who, be it observed, is also the President of the Y.R.A.—will consign the unfortunate circular to that waste paper basket which is so useful a receptacle in the rooms of Club Committees, Government officials, and even of statesmen of high degree. It would be lamentable indeed, if there were a lasting schism between the executive of this great yacht Club and the whole body of racing yacht-owners; but a permanent schism there must be if the circular is held to, for it is alleged, seemingly on good authority, that almost all the owners of racing yachts have agreed not to enter or sail their vessels except under Y.R.A. rules. Last spring the Committee showed much good sense in

tact in dealing with a difficult question. Now they seem to have made a step backward, and hardly to be keeping the promise they gave; but, happily, the proceeding is not irrevocable, and there will not be much difficulty in obliterating a mistake which every one will wish to forget. If, however, the Committee disregards its own undertaking, and adheres to the course indicated by the circular, the dispute will of necessity continue, the prestige of the famous Club will suffer, and its matches will present about as much interest as would be afforded by a flat-race of cab-horses.

#### TRADE PROSPECTS.

**T**HERE is a general expectation that the coming year will witness a great outburst of trade activity. A similar expectation was entertained at the end of each of the two past years and was disappointed. Is the present hope also to prove vain? The American purchases of iron, which in the autumn of 1879 dispelled the depression that had weighed so heavily on British industry, after a few months came to an end, and the check thus given to the revival of trade was intensified by the dissolution of Parliament and the general election which followed. In the summer of 1880, however, there came a fresh improvement, which continued to gain strength to the end of December; but the extremely bad weather of the first quarter of the current year—bad weather not confined to this country but extending to the Continent and even to America—gave a new check, and it was not until the summer that a recovery once more set in. During the past six months, however, that recovery has gone on at a rapid rate, and, as we have said, it is now expected that the improvement will become much more marked in the coming year. Yet it is to be borne in mind that the cause which has made the revival in trade so slow is still in operation. We refer, of course, to the agricultural distress. Agriculture is still the greatest single British industry, and distress prevailing in such an industry naturally prevents any improvement in trade from gaining the momentum that it otherwise would. The farmers are unable to spend in the towns at the rate which they formerly did. They are unable even to employ labour to the same extent; and they are unable also to pay their rents in full. The country towns thus suffer both from the poverty of the agricultural labourers and from the poverty of the farmers. All the great trades which are ancillary to agriculture, such as implement-making and the import of artificial manures and the like, suffer in the same manner. And trades which are dependent upon the landlords moreover suffer, because the latter are obliged to make large abatements in their rents. As long as this depression of the landed interest continues it is not probable that we shall witness a great outburst of trade activity. The distress, it is true, has not prevented a steady though slow improvement since the autumn of 1879; but it has slackened the rate of improvement, and has hindered it up to the present time from becoming marked prosperity. At the same time it is certain that improvement setting in in any great industry tends to transmit itself from industry to industry, and finally to pervade all departments of business. The present revival, as we have already said, began with the iron trade, to which activity was given by the large American purchases. It is now extended pretty generally throughout the trading classes, and if it continues, there will be an increased demand for agricultural produce of every kind which will tend to compensate the farmers for some of their losses in the past. If at the same time the harvest of the coming year should prove to be a good one, we may hope that at last the agricultural classes also will share in the revival. But until there is a really good harvest we can hardly expect to see any great outburst of prosperity such as is talked of.

The main ground on which the expectation of an outburst of trade activity is based is that the revival which set in in the autumn of 1879, though checked, as we have said, by various accidents, has overcome these opposing influences, and has gone on gaining strength steadily, though slowly, up to the present time. In the foreign trade, for example, the exports of British and Irish produce and manufacture for the first eleven months of the year exceeded in value the exports of the corresponding period of last year by 4½ per cent., just as the exports of 1880 themselves exceeded those of 1879. And the improvement has been much greater in the second half of the current year than in the first half. For, as we have already observed, the trade of the first half of the year was checked by the extremely bad weather of January, February, and March. The railway traffic returns, again—which are perhaps the best index to the condition of the country—have shown steady improvement throughout the past six months. Thus on seventeen selected railways of the United Kingdom the receipts from July 1 to December 17 exceeded those for the corresponding period of last year by 934,000*l.*, of which as much as 640,000*l.* was from goods, showing that the movement of goods about the country—in other words, the trade of the country—was considerably larger in the current half-year than in the second half of last year, although that again showed a large increase over the second half of 1879. The Revenue Returns also give proof of an improved condition of the people, showing that at last the activity of trade is beginning to tell upon the masses of the population. And all the market reports and trade circulars speak of increased activity, of sanguine expectations, and of good profits. As we have observed above, all experience teaches that improvement in any great department of trade transmits itself to

other departments, and finally pervades the whole country. It has now, as we have just seen, embraced almost every branch of trade and manufactures; and the opinion seems to be justified that it will continue to gain momentum for some time to come. It will be aided, too, by the fact that both prices and wages remain very low. Notwithstanding the continuance of the revival for nearly two and a half years, wages have risen but little in some trades, and have not risen at all in the greater number of trades, while prices are actually lower in some cases than they were two years ago. This cheapness of commodities and lowness of wages encourage consumption, and also enable producers to work at a very cheap rate. One of the peculiarities of the present time, to which we have called attention more than once in these columns, is that, owing to the extraordinary lowness of prices and wages, manufacturers are able to work with their own capital to a much greater extent than they formerly did; and trade, therefore, is sounder than it used to be, and also is more independent of bankers. As long as this peculiarity is maintained, it is greatly in favour of continued improvement in trade.

Another favourable condition is the goodness of credit. The great depression which reached its lowest point in the summer of 1879 was, to a large extent, the result of discredit. Now that credit is good, manufacturers find no difficulty in obtaining any accommodation they require, and they are thus able to lay in stock, and to increase their business in all directions. The most striking proof of the goodness of credit is afforded by the speculation that has prevailed for the past two years upon the Stock Exchange. But that speculation has now almost reached its climax. Prices are so high, and the charges made by bankers for enabling speculators to continue their operations are so onerous, that a further rise is not probable, at least to any considerable extent. Traders, therefore, who had put their surplus capital into Stock Exchange securities in the hope of increasing their principal have now no longer an inducement to do so. Their inducement rather is to sell out and to employ their capital in their own business and in extending their operations. Moreover, the very fact that speculation upon the Stock Exchange has nearly reached its limit is favourable to speculation in commodities. Since the American purchases of iron ceased, speculation has avoided commodities and thrown itself almost exclusively into Stock Exchange securities. The probability is that it will now turn from the Stock Exchange to commodities, and that we may witness a considerable rise of prices in these. That this will be so is certainly the opinion of the promoters of Companies, as is evident from the large number of new Companies and of loans that have been brought out during the current year. It is the business of these gentlemen to feel the pulse of the public and to provide it with new investments for its money as rapidly as the public is prepared to take them, and in the current year the number of new Companies issued is larger than it ever was before. In the first half of the year the issues of all kinds, including foreign and colonial loans, loans to corporations at home, to railway Companies and the like, as well as new Companies proper, exceeded three hundred, and in the second half they were about half as much again. It is impossible to say, of course, how many of these were fully subscribed. It is certain, indeed, that many of them were failures; but a considerable number were launched. It is impossible also to give the amount subscribed for the reason stated, and also because several of them—such as the French and Italian loans—were brought out abroad as well as in this country; but the amount, no doubt, was very large. There has been a considerable falling-off in the issues since the summer holidays began; but it is understood that the promoters are only waiting a little while to allow the public to digest what it has already taken, and that in the coming year even a greater number will be presented than in the year that is just ending. The fact is evidence of the extraordinary speculative spirit that is abroad. It also testifies that Stock Exchange securities have reached nearly the highest point to which they are likely to go. But it is, above all, evidence that the public are inclined to go into industrial enterprises of every kind, for mining ventures and railways constitute a very large proportion of the issues already made, while amongst those that are expected railway enterprises are exceptionally numerous.

A peculiarity in the present trade revival is the small amount of American purchases of British goods. Except in the last few months of 1879 and the first two or three months of 1880, when the American purchases of iron were very large, the imports of British and Irish produce and manufactures into the United States have been exceedingly small considering the unprecedented prosperity of that country. It would seem, however, that a change is now taking place. During the past three or four months the exports from the United States have considerably fallen off, owing partly to the badness of the harvest in America and partly to the great speculation in grain and pork in Chicago and Cincinnati. At the same time the imports from Europe have increased. With money as dear as it is in the United States, and with the great prosperity that prevails, it is natural to expect that both prices and wages will rise, and as wages and prices are low here at home it would seem probable that the exports from this country to the United States must continue increasing. If this should happen it will give a powerful impetus to the trade improvement. It would seem probable also that the purchases of iron by the Americans must increase, for the mileage of railways now under construction is unprecedentedly large, and although the American iron-

masters have hitherto been able to supply all that was needed by the Companies, it will be surprising if they can continue the supply all through the year. The extension of railways also in Mexico, in South America, in India and elsewhere, is likely to give an impetus to the iron trade which will be felt by all the allied industries, and ultimately throughout the whole business community. As yet the consumption of pig iron has not overtaken the supply. Even the restriction of the output which was recently agreed to, though it has raised prices, has not yet reduced the supply to the level of the demand; but the opinion prevails that the consumption is steadily increasing, and that a very little additional foreign demand would overtake the whole supply.

## REVIEWS.

### THE ENCYCLOPÆDIC DICTIONARY.\*

THE idea of a Dictionary combining with the etymology and explanation of words somewhat of the ampler treatment of subjects which is usually held proper to an encyclopedia is a good one; and the spirit in which it has been undertaken entitles the publication to general support. The first volume of *The Encyclopædic Dictionary*, lately issued, gives a very fair notion of the scope and execution of the work; and, from the sample now before us, we are led to think highly of what the whole, when completed, will be as a compilation of varied knowledge, fairly accurate in substance, ample in detail, and handy for reference. It aims at giving all English and Scottish words now in use, with their several significations, reinvestigated, reclassified, arranged afresh, illustrated by examples of their use, and fortified by quotations, the derivations and definitions being in a large measure the result of original research and independent study. In addition to these, the Dictionary is made to include a large number of obsolete words, likely to afford much assistance in the perusal of old English authors. Obsolete spellings and earlier uses of existing words have also been given, the latter chronologically arranged, on the plan adopted in Littré's incomparable work, so as to show, where possible, the process by which the present meaning has come about. Words which have altogether dropped out of use are marked by an asterisk (\*); those which, though not wholly dead, are rarely used, with an obelus (†). Besides archaic and provincial words, special attention has been promised to scientific and technical terms, many of which, we are told, are included in no other English dictionary. The etymology of each word, the pronunciation being made clear to the eye by diacritical marks, is the first point brought under notice, the derivation being carried back from its immediate source, direct affinity, or analogous usage in modern speech to the furthest traceable root in bygone or primary forms. The two main springs are of course the Old English, Early German, or occasionally Gothic for words of a native stem, and Latin for those from a Romance original. In the adoption of pictorial illustrations the work before us has the precedent of Webster's admirable Dictionary, which it also closely resembles in the mode of exhibiting the etymology of words, whilst greatly exceeding it in bulk by virtue of the encyclopædic treatment which it superadds to the character of a dictionary. Under this aspect it follows more closely the type of the German *Realwörterbuch*. It finds also, to some extent, a parallel in the greatly expanded edition of Ogilvie's *Imperial Dictionary*, now being issued by Messrs. Blackie of Edinburgh. We shall feel an interest in seeing these two deserving publications run side by side in honourable rivalry for the palm of literary excellence and public favour. The woodcuts in both are clearly and artistically executed. Those in the English dictionary, by no means so numerous in proportion as those of its Scottish rival, or those given by Webster, seem well selected for the elucidation of the text. This may especially be said of the flowers, birds, fishes, and other natural objects. What verbal definition or description, for instance, could convey to the unlearned reader anything like the idea of a *Sen-anemone* which is given by a glance at the delicately-drawn group of three or four typical specimens? The *Adonis*, or pheasant's eye, might be looked for in vain through many a meadow or cornfield with no further clue to its identity than that of its coming under the order of Crowfoots, or Ranunculaceæ, "with five sepals and five to ten petals, without a nectary, stamens and styles many, fruit consisting of numerous awnless achenes grouped in a short spike or head." The sketch of the graceful plant, with its flower and fruit showing a head of achenes, with a single achene magnified, scarcely needs the bright scarlet glow of the original to stamp upon the mind of the novice in field botany the image of this ornament of nature. The picture of the Argonaut makes clear the natural attitude as well as the structure of this elegant cephalopod, correcting the poetic fable, to which Aristotle first gave sanction, that the animal floats with the concave side up, holding out its arms after the manner of sails to catch the breeze. Naturalists teach that when the Argonaut floats the sail-shaped arms are drawn closely to the sides of the shell, and when the animal crawls, as here depicted,

at the bottom of the sea, the so-called boat is reversed like the shell of a snail. Another curiosity of natural history, the *Argyroneta*, or silvery spider (from *ἀργυρος*, silver, and *νῆρος*, spun, from *νέω*, to spin, or, less probably, heaped up, from *νέω*, to heap), is well illustrated by the *A. aquatica*, or diving species, which weaves for itself a singular bell-shaped dwelling at the bottom of the water, to which it carries down its prey to devour it, holding entangled in its hairy covering air enough, which it sets free in bubble after bubble, to support respiration, as it is provided with lungs, not, like fishes, with gills. The general aspect of *Algacem*, or flowerless seaweeds, is clearly to be made out from the group which brings before the eye some half-dozen varieties of these graceful feathery forms; and the structure which gives its name to the class of Acotyledonous plants, so difficult for the ordinary reader to grasp from the lengthy and complex Greek designation, is to be made out beyond the utmost power of verbal definition from the sketch which shows together *Agaricus campestris*, *Tuber melanosporum*, and *Polytrichum commune*.

In the course of recent ritualistic controversy and litigation, how often must readers have been puzzled to realize what was meant by a baldachin. It is something to have the meaning and history of the word briefly yet amply set out:—

**bāl' dā-chin, bāl dā-chī' nō, bāl' dō-kyn, s.** [In Dan. *baldakin*; Ger. *baldachin*; Fr. *baldapain*; Sp. *baldagui*; Ital. *baldachino*=canopy; Low. Lat. *baldachinus, baldachinus*=(1) rich silk, (2) baldachin; from Ital. *Baldacca, Baldach*=Bagdad, the well-known city near the eastern limit of Turkey in Asia, whence the rich silk used for covering baldachins came.]

1. *Properly*: A rich silk cloth erected as a canopy over a king, a saint, or other person of distinction, to increase his dignity.

2. *Eccles. Arch*: A canopy, generally supported by pillars, but sometimes suspended from above, placed over an altar in a Roman Catholic Church, not so much to protect it as to impart to it additional grace and dignity.

But no amount of description could give an idea of the thing itself at all comparable to a glance at the woodcut of the great baldachino of St. Peter's at Rome. A similar model in miniature, we may add, is to be seen—the gift of the late Pope Pius IX.—in the Italian Church, Hatton Wall. It may be thought strange that the derivation of "bread" should exercise and divide the minds of our linguists and etymologists; but there seems to be no help for it. No one, at least, ventures to dogmatize upon the origin of the familiar word. Many have rested content with tracing it, after Horne Tooke, to the verb "to bray"—i.e. to break small, pound, or grind; in German *brechen*, cognate with our "break"; A.S. *brecan*; in French *broyer*; Old French, *briser, brechier*. This root, with its manifold forms, may doubtless be set down as onomatopæic in origin, imitating the sound of breaking. Mr. Bosworth's authority has of late turned the favour of etymologists towards A.S. *breowan*, to brew or ferment, it being the impression that fermentation, not grinding, was the distinctive idea under which the word got established. In the ample treatment of the word, with its collateral forms, in *The Encyclopædic Dictionary*, whilst both lines of derivation are indicated, we are glad to see the preference given to the older of the two:—

**brād** (1), \***breed**, \***bred**, \***brede** (*Eng.*), **broad**, **broid**, **brede**, **brede** (*Scotch*), s. & a. [A.S. *brād, breud*=a bit, a fragment, bread; O.S. *brād*; Icel. *brauð*; Sw. & Dan. *brød*; Dut. *brood*; Ger. *brød, brot*. From A.S. *breowan*=to brew (*Bosworth*). From that verb or better from A.S. *breutan*; nmp. *breat* (*Mahn*).]

*The Imperial Dictionary* has no more to say of its origin than "root doubtful," nor has Latham's last edition of Johnson. We may hope ere long to hear the latest word of our most advanced and approved experts, now that the great Dictionary of the Philological Society is said to be within a measurable distance of coming to the light. Besides the origin of the word, much information touching the history and making of bread is compressed into the three columns given to the article in the Dictionary before us, with a good deal of practical advice as to the processes of mixing, kneading, and fermenting bread. The methods of adulteration largely employed in the trade are exposed, and the test of genuine, well-made, and wholesome bread pointed out. Whole-meal bread, made from unsifted ground wheat, is properly described as the only true brown bread, being richer in nutrients than white bread—the amount of nitrogenous matter in white bread varying from five to eight per cent., whilst in whole-meal bread it rises to fourteen per cent. Not less important is the retention in unbolted wheat flour of the phosphates and silex, so essential to the formation and nutrition of the bones and teeth. There is here simply a reversion to the good old bread of our forefathers—the modern taste for soft, spongy white bread seeking rather to please the eye than to nourish the body, the fashion being specially fostered by the bakers of Paris and Vienna. Finding leaven, to our surprise, defined as "a mixture of flour and potatoes and water, kept in a warm place till it begins to ferment," we can but ask what and where was leaven through the long ages from the dawn of history till the discovery of Virginia? If it was not to be made without potatoes Moses might have spared himself many a restriction upon the indulgence in leavened bread.

It may be thought safe to derive "breeze" from the French *brise*, although some doubt may be suggested by *brisa* Sp. and *brisa* Port.=the north-east wind, and *brezza* Ital.=a cold wind. *Brise* may well express the gentle air that ruffles or breaks the water. At the same time it is to be observed that the word is not of old usage in French. It was not introduced, says Littré, into the Academy's Dictionary till the year 1762. He describes

\* *The Encyclopædic Dictionary: a New and Original Work of Reference to all the Words in the English Language, with a Full Account of their Origin, Meaning, Pronunciation, and Use.* By Robert Hunter, M.A., F.G.S., Mem. Bibl. Archæol. Soc., &c., assisted in special departments by various Eminent Authorities. With numerous Illustrations. Vol. I. A to CA. London, Paris, and New York: Cassell, Petter, Galpin, & Co.

the word as *d'origine inconnu*, and suggests for it a connexion with the Gaelic *bris*, allied to "bruise," which in turn opens up not a few suggestive connexions. There is, in truth, no limiting the lines of relationship which are to be drawn out when words are traced back to their earliest assignable source. Nearly allied to the family just noticed we have yet another group, of which the simple sound expressed by the word "break" is the common parent:—

*bréach*, \* *bréache*, \* *breche* (Eng.), \* *brache* (Scotch), & c. a. [A.S. *brice*, *bryce*, *brece*, *gabrice* = a breaking; Sw. *bräck* = a breach; Dan. *bræk*; Dut. *breuk*; Ger. *bruch* = a breaking, a rupture; Fr. *bris* = a breaking; *brèche* (see A., I., 3 d); Sp. & Port. *brecha*; Ital. *breccia*. BREAK.]

Another variant from the same root is "brake," German, *brache*; L. German, *brake*; Dutch, *brank*, an instrument in the first place for making flax or hemp, afterwards for training horses, for torturing—as in Beaumont and Fletcher—for harrowing the ground, and later on for chocking the "reed of machinery. Of archaic words, which form a conspicuous feature of the work, we may note a quaint example in *Bread-lin-gis*, an adverb for which *Bannatyne's Journal* is quoted—"and straik one of them *breadlingis* with his sword"—where the word, we need scarcely say, has no connexion with the staff of life, but comes from the old Scotch "bread" = broad, with suffix *-lingis* = ling, like. Hardly anybody, it may be, needs to be told what a belfry is. But many a one will be surprised to be told that in point of etymology it has nothing to do with bells, the word coming to us from the French *beffroi*, O.F. *belefroi*, *belfroi*, *beffroit*, &c., Low Latin *belfredus*, *verfredus*, a watch-tower, from the German *bercurit*, *berwrit*, and this from *bergan*, to protect, and *fridu* = a tower, connected with *fride* (peace). It is only by samples, and those limited in number, that we can pretend to give any notion of the scope and value of such a work as a dictionary. But neither is it needful to get through a whole cheese in order to give a report of its flavour.

#### THE VISIONS OF ENGLAND.\*

MR. PALGRAVE is so admirable and practised a judge of poetry that a critic cannot approach his poetic works without diffidence. If any one knows what is right, it is Mr. Palgrave, and if his verses do not always seem to us to present the qualities which he would commend in those of another, we cannot but be conscious that our own judgment may be in fault. The task Mr. Palgrave has set himself is one in which it is no discredit not always to have been successful, for it almost exceeds the scope of human powers. He has attempted to write an epic of England, if we can call that an epic which is judiciously cast in the form of a series of lyrics. His endeavour, as he says, has been

to revert to the earlier and more natural conditions of poetry, and to offer—not a continuous narrative, not poems on every critical moment or conspicuous name in our long annals—but single lyrical pictures of such leading or typical characters and scenes in English history, and only such, as have seemed to me amenable to a strictly poetical treatment. Poetry, not history, has hence been my first and last aim, or, perhaps, I might define it, history for poetry's sake. At the same time, I have striven to keep throughout as closely to absolute historical truth in the design and colouring of the pieces as the exigencies of poetry permit.

To Mr. Palgrave's conscientious and careful endeavour to say nothing that is not true, or, at least, that is not founded on the best possible evidence, too much praise cannot be given. Yet we cannot but hold that, if he had been more of a partisan, he would have been more successful as a poet. What moves us in poetry is a certain energy of passion, and even a certain blindness to modifying conditions; both of them qualities which Mr. Palgrave has occasionally found it necessary to discard. The poetic loss, not compensated for by historic gain, is particularly manifest in his poems on various events and characters in that debatable land—the seventeenth century. Looking back at other poems which deal with the Rebellion, with Charles and Cromwell, and Strafford and Pym, which do we find to be those that move us as poetry ought to move us? Surely the partisan poems—verses in which the writer sees nothing but good on his own side, nothing but evil on the other—are the successful lays. Our own political opinions are set aside when we read Marvell's Ode on Cromwell, which, with all its comparative justice and balance, finds in its hero a hero indeed. Without change of political mood, we are thoroughly fired by Mr. Browning's Kentish Sir Byng, who "stood for his king" like a gallant gentleman; or by Macaulay's description of the Roundhead charge on "the ranks of the accurat." Mr. Palgrave looks at things much more closely, with, we fear, the inevitable result that his verse loses as poetry what it gains as criticism. "After Chalgrove Fight," or "In an Oxford Churchyard," we do not want to hear that Cromwell was "Philistia's child and chief." This historical judgment, expressed in the slang of the day, may or may not be true; but it is certainly out of place beside the grave of Falkland. Again, the poem on Cromwell ("The Return of Law") is most subtly designed, and the hostile judgment tempered, for "mortal failure has tears." Yet we can scarcely endure to have it said in poetry of Cromwell,

Catlike he bristles, and purrs about God; but within are the claws;

and more in this satirical strain, which matches ill with such fine lines as:—

For he leant o'er his own deep soul, oracular; over the pit  
As the Pythia thronged her of old, where the rock in Delphi was split;  
And the vapour and echo within he mis-held for divine; and the land  
Heard and obey'd, unwillingly willing, the voice of command.

It is a curious thing that while genuine ringing partisan poems on either side do affect a reader, of whatever party he may be, merely as poetry should do, Mr. Palgrave's balanced and measured praise and dispraise somehow stir our partisan feelings, and we feel inclined to argue rather than to appreciate. Perhaps we may infer that the poetry of history should be treated in a spirit less carefully historical. It is not that the "Return of Law," "After Chalgrove Fight," and "In an Oxfordshire Churchyard" are not interesting, and well worthy to be read and pondered over. But in song we prefer, we admit, the frank partisanship of Homer, always determined, as Johnson would have said, that "the dogs of Trojans shall never have the best of it." From lays thus critical, and opinions thus balanced, one turns with pleasure to the perfect simplicity and spontaneity of another "vision" of the seventeenth century, "The Captive Child," Elizabeth, second child of Charles I. and Henrietta-Maria. Mr. Millais's picture of the Princess in her captivity will probably be remembered by many of Mr. Palgrave's readers:—

As in her infant hour she took  
In her hand the pictured book  
Where Christ beneath the scourger bow'd,  
Crying "O poor man!" aloud,  
And in baby tender pain  
Kiss'd the page, and kiss'd again,  
While the happy father smiled  
On his sweet warm-hearted child;  
—So now to him, in Carnbrook lone,  
All her tenderness has flown.

—Statue-still and statue-fair  
Now the low wind may lift her hair,  
Motionless in lip and limb;  
E'en the fearful moon may skim  
O'er the window-sill, nor stir  
From the crumb at sight of her;  
Through the lattice unheard float  
Sadder blackbird's evening note;—  
E'en the sullen foe would bless  
That pale utter gentleness.

—Eyes of heaven, that pass and peep,  
Do not question if she sleep!  
She has no abiding here,  
She is past the starry sphere;  
Kneeling with the children sweet  
At the palm-wreathed altar's feet;  
—Innocents who died like thee,  
Heaven-ward through man's cruelty,  
To the love-smiles of their Lord  
Borne through pain and fire and sword.

We have said that, in our opinion, Mr. Palgrave's historical conscientiousness has not always befriended his poetical success. But he has had to contend with another difficulty, too strong, we fear, for any poet. Many of his pieces are necessarily concerned with the most stirring events, especially with great battles. They are, in fact, war-poems. Now we almost doubt whether, with exceptions easily numbered, poems of this kind can be written well, except in the very glow of victory, or in the very bitterness of defeat. And even then, perfect examples of such poetry are excessively rare. A collection of successful English poems of battle would make but a slim volume. How few they are a glance at the *Golden Treasury* will reveal. Several of them, perhaps the majority, like "The Burial of Sir John Moore," "The Battle of the Baltic," "Hohenlinden," "The Charge of the Light Brigade," were written when the events were yet hot in the hearts of men. We all know in what mood Rouget de Lisle composed "The Marseillaise," and Alfred de Musset wrote his lyric on the Rhine. Good and stirring poems of this class have also, no doubt, been written long after the event, like Mr. Tennyson's ballad of "The Revenge," Mr. Browning's "Hervé Riel," and Drayton's "Agincourt," or, from the defeated side, the song of "The Flowers of the Forest." But, on the whole, the heat of actual excitement seems almost necessary, if a poet who sings of Inker-mann, or Senlac, or Zutphen, is really to be inspired. Mr. Palgrave has necessarily had but little to inspire him in the recent history of England. Hamilton's charge on the Afghan guns, when he alone attacked the murderers of Cavagnari, might have given Mr. Palgrave a subject; or Forbes's rush against three thousand Ghazis, when the Etonian and one sergeant ran fifty yards ahead of their regiment into a dense mass of swordsmen, might have suggested a theme. But Mr. Palgrave touches on no battles later than Inker-mann, and therefore necessarily lacks what we venture to consider an almost indispensable source of vivid poetry, the inspiration of the excitement of the moment. Among a number of battle-pieces, we think "Sidney at Zutphen" decidedly the most successful, and that, no doubt, because the memory of the charge of the Light Brigade at Balaklava is still sufficiently near us to inspire the poet of a similar feat of war:—

Red walls of Zutphen behind; before them, Spain in her might:—  
O! 'tis not war, but a game of heroic boyish delight!  
For on, like a bolt-head of steel, go the fifty, dividing their way,  
Through the brown mail-shirts, and over,—Farnese's choicest array;  
Over and through, and the curtel-axe flashes, the plumes in their pride  
Sink like the larch to the hewer, a death-mown avenue wide:  
While the foe in his stubbornness flanks them and bars them, with  
merciless aim  
Shooting from musket and saker a scornful death-tongue of flame.

\* *The Visions of England*. By Francis T. Palgrave, late Fellow of Exeter College, Oxford. London: Macmillan & Co. 1881.

As in an autumn afar, the Six Hundred in Chersonese hew'd  
Their road through host, for their England and honour's sake wasting  
their blood,  
Foolishness wiser than wisdom!—So these, since Azincourt morn,  
First showing the world the calm open-eyed rashness of Englishmen  
born!

Mr. Palgrave's poems touch on such an immense variety of topics—giving the most careless reader a novel and powerful impression of the richness of the story of England—that we cannot attempt to criticize them all in detail. He is most successful, we think, when his scenes are peaceful and his measures simple and not unfamiliar. The number and variety of his measures are, indeed, more than almost any poet could hope to manage with unvarying success, for every writer—except such masters of language as Victor Hugo and Mr. Swinburne—has but a few rhythms and metres of which he is perfectly master. Among Mr. Palgrave's successes we reckon "A Danish Barrow," of which we can only afford space for two detached stanzas:—

Lie still, old Dane, below thy heap!  
—A sturdy-back and sturdy-limb,  
Whoe'er he was, I warrant him  
Upon whose mound the single sheep  
Browsers and tinkles in the sun,  
Within the narrow vale alone.  
And thou,—thy very name is lost!  
The peasant only knows that here  
Bold Alfred scoop'd thy flinty Bier,  
And pray'd a foeman's prayer, and lost  
His auburn head, and said "One more  
Of England's foes guards England's shore."

Another piece, full of quiet charm, is "At Bemerton," a monody on the memory of Herbert, "His memory is Peace, and peace is here." It is hardly possible but that "Simplicity" (Reynolds to his little model Theophila) should be a general favourite; and many people will learn for the first time from "The Childless Mother" the pathos hidden by the commonplace figure of Queen Anne:—

O the little footsteps  
On the nursery floor!  
Lispings light and laughter  
I shall hear no more!  
Eyes that gleam'd at waking  
Through their silken bars;  
Starlike eyes of children,  
Now beyond the stars!  
Where the murder'd Mary  
Waits the rising sign,  
They are laid in darkness,  
Little lambs of mine.  
Only this can comfort:  
Safe from earthly harms  
Christ the Saviour holds them  
In his loving arms.

The *Visions of England* is, or ought to be, a book for the large public, for all Englishmen who love poetry and their country. This being so, we must express our regret that Mr. Palgrave has too frequently introduced allusions scarcely intelligible except to scholars. It is easy, and perhaps not unnatural, to object to such expressions as "Mund's Eru-elloquent eyes," and the address to Mary Stuart as

O too-too woman, untimely born."

"Too-too woman" are indeed the children of our own age, and would have been sadly out of place in the days of Mary and Elizabeth. But we prefer to turn from verbal fault-finding to such passages as that which describes how Richard of the Lion-Heart, for all his conquests,

Yet never saw the vast Imperial dome,  
Nor the thrice Holy Tomb:—  
—As that great vision of the hidden Grail  
By bravest knights of old  
Unseen:—save only of pure Parcivale.

Patriotism is not now so common or popular a virtue as to make Mr. Palgrave's book a needless reminder of all that England has been and is, and of all that her children owe to such a mother.

#### YOUNG JAPAN.\*

IT will not be the fault of book-makers if the present generation of Englishmen does not know as much about the revolution in Japan as about the Reform Bill of 1832. First of all, we had Mr. Adams's bulky volume on the subject; then followed, among others, Sir R. Alcock's *Capital of the Tycoon*, Griffiths's *Empire of the Mikado*, Mouncey's *Satsuma Rebellion*, Sir E. Reed's *Japan*, Miss Bird's *Unbeaten Tracks in Japan*, and now we are called upon to face Mr. Black's imposing-looking work. No doubt the subject is a tempting one. There is so much that is new, strange, and attractive about the people and country, with just enough spice of danger to add a piquancy to life in their midst, that the desire of those who may have made Japan their home to pour the tales of their novel experiences into our ears should not be a matter for surprise. Unfortunately for Mr. Black, and for any who may be tempted to follow him, the subject has been so thoroughly threshed

out that there is now not a grain of anything new left in it. Like everything else in Japan, the whole course of recent events has been performed in public. There was never any attempt made to conceal who were the real wire-pullers or what were the objects they desired to bring about. The *cacoethes scribendi*, common to all Japanese, which induced the Mikado and Shogun, with their official supporters, to put on record every move in the game effectually dissipated any approach to mystery. Later historians have therefore little or nothing to add to the accounts of their predecessors; and, in fact, in Mr. Adams's and Mr. Mouncey's works will be found all the main points which have been amplified and re-told so often since.

Mr. Black takes pains to assure us that his book makes no pretension to the dignity of history, to which he seems to have an aversion. He evidently considers it necessary that history should be written in an unreadable style; and he claims for his volumes the advantage that the introduction of personal reminiscences has given them "a sweetness and light" which otherwise they would have been without. This is a question of taste, and possibly "some old resident of Yokohama of the early days" may consider the introduction of the following passage a subject for congratulation; but we do not. After dwelling at very full length on the deplorable murder of Mr. Richardson, a "personal reminiscence" suddenly occurs to the author; and, without any kind of explanation, he takes us into his confidence in these words:—

The autumn race meeting took place on the 1st and 2nd August. Mr. Morrison had but one pony entered, and he was unsuccessful. It was now that the game little pony *Botanna*, that held its own against all comers for so many meetings, first showed the mettle that was in him. He won easily everything he went for.

Such interpolations may possibly be of interest to the few frequenters of the Yokohama Honges in bygone days; but to most of those who take up Mr. Black's volumes they are utterly meaningless, and considerably reduce the interest which may reasonably be taken in a record of the history of Japan during the last twenty years. For, though the story has been repeatedly told, there are always some people to whom it is a revelation; and these would undoubtedly prefer to have it undiluted by Mr. Black's personal reminiscences.

To the student of history the wondrous change which has come over the political and social system of Japan during the last two decades must always be a hard nut to crack. Great constitutional changes in a country are generally, and, if it were not for the case of Japan, we should have said invariably, brought about by slow processes, and in obedience to the tacit or declared will of the majority of the population. But in Japan the dicta of a handful of officials were sufficient, within the space of a few months, to convert a semi-deified sovereign, who was too sacred to be gazed upon and too god-like to take a personally active part in the affairs of this world, into a dapper, inquisitive monarch, equally ready to review fleets, marshal armies, or receive foreign diplomatists; to sweep away his *Maire du Palais* and the whole array of feudal princes who divided the empire between them; and to disestablish the only form of religion which had any hold whatever on the mind of the people. When it is added that all this was effected in direct opposition to the private interests of the feudatories and people concerned, and avowedly in imitation of European institutions, which the entire population, from the Mikado downwards, had always affected to despise, we have a picture before us which finds no parallel in the history of the world. It may be perfectly true, as Mr. Adams, in his *History of Japan*, says, that, "when the foreigner appeared on the scene, everything was already ripe for a revolution"; but no one outside Jupiter and Saturn world, in their wildest dreams, have imagined the extent of the changes that were about to be effected, or the direction which they were destined to take. The feudal system, with all its accompaniments of privileged classes and large and independent local forces, was as deeply rooted in the national mind as anything could be in that shallow soil. And when we remember that the people, be their faults what they may, are brave, impetuous, and warlike, and that the country was overrun by the armed retainers of the various daimios, whose interests as individuals and as a class were all on the side of the old order of things, we can only be surprised that the resistance to the new constitution was so feeble, and that the assaults on foreigners, the political assassinations, and the local outbreaks were not a hundredfold more numerous than they were.

In everyday life we meet people who have a profound distrust of themselves—their tastes, their opinions, and their knowledge—and who desire always to take others stronger than themselves as models for imitation. This appears to be the case with the Japanese as a nation. The constitution which they threw over with so light a heart had served them for many centuries, the people were contented under its sway, and the country was fairly prosperous; but the instant it was brought into contrast with foreign institutions, its supporters and those whom it had benefited and protected became heartily ashamed of it. Without waiting to see whether it might be modified or reformed, they jumped to the conclusion that it must be thrown overboard, and a false shame even prompted the desire to exclude foreigners from the country until all traces of the old order of things should be swept away. A despatch addressed to the Tycoon by the Mikado, dated 1863, in which an order is given for the expulsion of foreigners, ends with these words:—"You may let them (*i.e.* the foreigners) entertain a slight hope that Kanagawa will be re-

\* *Young Japan, Yokohama, and Yedo: a Narrative of the Settlement and the City from the Signing of the Treaties in 1858 to the Close of the Year 1879. With a Glance at the Progress of Japan during a period of Twenty-one Years.* By John R. Black. 2 vols. London: Trübner & Co. 1880.

opened at some future period; for the Daimios say that Japan will be able to receive foreigners without blushing in six or seven years."

The same false shame may very probably be the cause of the restrictions which even now hamper the right of foreigners to travel into the interior of the country. Miss Bird has shown us that there are still parts of Japan where the presence of the new civilization is made known only by the increased financial burdens entailed by its adoption; where the people are poor, degraded, and untought; and where the conditions of existence are as unlike those prevailing in Yedo as life in an obscure Turkish village is unlike that to be enjoyed in Paris or London. The same lady tells us that, on one occasion, when she was an unwilling spectator of a scene of wretched degradation, her Japanese servant hid his face in his hands and burst into tears at the idea of a foreigner witnessing his countryman's disgrace. This feeling would be highly commendable were the sense of shame aroused by the misconduct of his countrymen, and not by the fear of being laughed at by the foreigner. But the conduct of this man is typical of that of the officials throughout the late reforms. Old manners and customs, dress and habits, which, judged by the native standards, were perfectly unobjectionable, became in their eyes ridiculous and indecent directly they proved to be so considered by the foreigner. The natives of India do not deem it necessary to wear pantaloons and frock-coats because it is the custom of Englishmen to do so, neither do Chinamen cast aside their baggy trousers or cut off their queues at the sight of the closer fitting clothes and short-cut hair of the "outer barbarian." Nor was there any reason why the Japanese should be ashamed of their political and social institutions. But there is a spirit of unrest among the people, with a want of discrimination in their zeal for reform, which is rapidly robbing the country of many of its attractions and artistic delights. We would rather that the Jimrikucha men had continued to work in the undress of Indian coolies than that the artists should have exchanged their magnificent colours for indifferent European paints; and we could almost have borne with other questionable customs of the country rather than that the workers in ivory and enamel should have exchanged their old exquisite style of work for the manufacture of cheap gewgaws for the European market. But the tendency of the Japanese mind is to imitate a chosen model in everything, whether it be good, bad, or indifferent. For the time being all that is European is right, and therefore all that is Japanese is wrong. At the present moment the position of the country presents strange contradictions. While every young man of the smallest pretensions to education has at his fingers' ends Whenton's *International Law* and the works of Mill and Mr. Herbert Spencer, foreigners are not allowed to travel beyond certain prescribed limits, many of the commonest laws of political economy are systematically violated, and except in the "show" parts of the Empire the people are left in their former ignorance and in more than their former poverty. If it were not that experience has taught us that any move on the political chessboard is possible, the Imperial edict which has within the last few weeks been issued, commanding that the introduction of representative institutions should be postponed until the year 1890 would be a matter of surprise. There is about the mandate a flavour of the old régime, and a dragging of public opinion, which is out of harmony with the very advanced professions of the Government.

These are probably some of the considerations which will occur to the minds of the readers of Mr. Black's volumes. Another will possibly be, that the matter contained in them might with advantage have been reduced by one-half. The author has allowed his taste for newspaper cuttings to run riot, with the result that he has introduced much that is utterly uninteresting, and has given a disjointed and jerky tone to his pages.

#### THE DUTCH COUSIN.\*

A *DUTCH COUSIN* resembles a Dutch picture inasmuch as great care and thought have evidently been bestowed on it. In fact the plot is only too intricate; and though the author has grasped the threads and succeeds ultimately in disentangling them, the various incidents are so involved as to task, and almost overtask, the reader's attention. Three kinsmen of nearly the same age, and all bearing the distinguished patronymic of Gordon, exercise a baleful influence on the fortunes of the heroine. Two of them die or disappear; there is a mystery hanging over her birth and parentage; and when she is claimed for a time by the third as his child, it turns out, after all, that she has been the victim of a deception. We know, of course, that all will come right in the end, but for long the beautiful Mara Gordon seems destined to be the sport of capricious fate. She is an heiress and no heiress. She inherits a couple of handsome fortunes which a sensitive conscience prevents her spending. She doubts—and doubts rightly, as it appears—whether the properties bequeathed really belong to her; and so she has to support the odious imputation of being miserly and selfish, although she is naturally generous and the soul of disinterestedness. She would have felt the misconception more, had she not been worried by her love-troubles, for the secrets that are the key to her apparently eccentric behaviour

separate her from the man who is the master of her heart. The novel is a story of character as well as of incident, and Mara's character, as it comes out in her trials, has been worked out with considerable skill. She has courage as well as tenderness, and has ample opportunities of showing both. Yet the author, although she delineates a bewitching heroine, does not fall into the fault of making her perfection. Mara makes friends wherever she goes, so that she has no want of sympathy or help in her sorrows; and there are a couple of highly eligible lovers who would gladly lend their shoulders to bear her burdens. But although the girl is all that is good and sweet, she shows the natural shortcomings of her years and temperament. She is selfish, not from calculation or instinct, as her maligners supposed, but from heedlessness. She wins a nobly disinterested love and rejects it, partly because she does not care for the gentleman, but chiefly on the ground of disparity of age. That inequality of age was in itself an excellent reason, as no one is more ready to recognize than the modest suitor whose hopes are disappointed. But while he appears, by a sustained effort of self-control, to forget what passed between them, she forgets in reality, or scarcely feels; and the unfortunate Rolf Graham is set to fetch and carry, without having the reward of his generous abnegation in the shape even of due appreciation. That girlish thoughtlessness of Mara's is a clever touch of art, for it makes the engaging heroine all the more lifelike, while it brings into bolder and brighter relief the masculine beauties of Mr. Graham's character. And the novel is full of movement. We may say, indeed, that the scenes are panoramic, so quickly do they succeed each other, and so often are they shifted. They are chiefly distributed between Scotland and Holland; but in the rapid and sensational course of the story we pay visits to many other parts of the Continent, and are transported to South Africa and the Australian colonies as well. For Mara's many friends belong mainly to the wealthy and travelling classes, and they hire villas on the Swiss lakes and palaces in Rome, while necessarily sojourning between times at innumerable fashionable hotels. Not that we complain of this, for the author is evidently familiar with the Continent, and she can dash in from memory an effective background to the groups of figures she is setting in motion. And, what is more seldom the case with English novelists, we presume she knows something of Continental life as well; for we remember reviewing favourably on a former occasion the lively volume she wrote on *Life in a German Village*.

The story opens in the old Dutch mansion near Utrecht, from which Mara has drawn her parentage on the mother's side. The old Red House, with its massive brick architecture, its tiled courts surrounded by spacious outbuildings, and its trim gardens blazing with colour, might have seemed to associate itself rather with prosaic respectability than romance. But one of the heads of the wealthy mercantile firm of the Von Meynhorsts had shown himself eccentric in more ways than one. Having devoted himself to abstract learning in place of money-getting, and having left science for the counting-house under a sense of duty, he landed in a melancholy love-match under singular circumstances. Mastered by an overpowering passion, he married a beautiful Spanish girl, in spite of a discouraging consultation with her family physician. Amara was doomed to an early grave by an incurable malady, and he knew that their wedded happiness must be measured by years at the utmost. The inevitable shock he expected killed his bride rather sooner than later, and she bequeathed her disease to their only daughter. That child, when grown to womanhood, eloped, under rather discreditable and suspicious circumstances, to become the mother of Mrs. Chetwynd's heroine, who was christened Mara, after her mother and grandmother, by a sentimental but suitable abbreviation. The mystery attaching to Mara's parentage is the influence that rules her emotional girlhood, impelling her on a settled line of conduct that is often foolish and sometimes seems unfeeling. She knows that her unhappy mother has long been dead, but her desire is to be reunited to her surviving parent. She feels it incumbent upon her to carry out this fixed determination when her old maternal grandfather dies suddenly at Utrecht. Had she known when she was well off, or been more careful of her comforts, she would have stayed quietly where she was. The old gentleman has left her ample means, while attaching conditions to the disposition of his property. Although his partner, who is left her guardian, had spoken to her as a lover, she knows nevertheless that Rolf Graham is the most delicate-minded of men; and there is the housekeeper Gretchen—a charming old Dutch lady, by the way—who might have continued to tend her in a mother-like capacity. But Mara has a communication from the gentleman who calls himself her father, and is only eager to be gone. She takes leave of her Dutch friends with scant ceremony, to rue her disregard of their feelings in sad disappointment. To be sure, the change from the Dutch flats to the Highland hills is refreshing; she is exhilarated by the air, and she revels in the scenery. She makes fast friends among the humbler specimens of the old-fashioned Highland women, and she finds a lover who subsequently deserts her. But it turns out that the gentleman who received her as a daughter was in reality not her father at all; and though he leaves her a second fortune in his extensive Highland property, she has the gravest doubts whether she has a moral right to it. For, having sought like Saul after familiar spirits, or at least solemnly consulted a notorious witch, she is brought to entertain a hope almost amounting to conviction that her veritable father is living still; and she devotes herself to the task of tracing him out as a doubly sacred duty when she hears of the stains that rest on his reputation.

\* *The Dutch Cousin*. By the Hon. Mrs. H. W. Chetwynd. Author of "Life in a German Village," &c. London: Chapman & Hall. 1881.

The stains are indeed ugly enough, for he is charged with wholesale forgery and a murder to boot. So that, always assuming him to be still unchanged, he has obvious motives for close concealment. The heiress sets about her pious work with the shrewdness and energy of the most indefatigable of detectives. She is assisted by devoted friends, and luck serves her besides, so we are saved from any very agitating suspense by the assurance that her efforts will be crowned by success. To start her fairly on the quest the author has recourse to the novelist's time-honoured machinery, which, being kept in constant use, works as satisfactorily as ever. A chest of family papers is brought to light in a secret room of the old Highland mansion, with an ancient will regularly executed. Besides this, a journal of the missing man falls into the hands of his daughter, which proves the advantage of keeping an exhaustive diary when conscience has nothing to conceal. That silent but eloquent witness clears his character morally, while legal proof of his innocence is subsequently supplied by the evidence of foreigners who had been personally acquainted with him. Finally the missing gentleman is run to earth in a remote corner of South Africa, where he had become the beneficent Providence of the neighbouring natives; and Mara's temporarily faithless lover has the merit of the discovery. Considering that he must be supposed to have had some regard for his own good name, and that he must be credited with some amount of paternal affection, old Mr. Gordon has to explain how it came about that he never attempted either to vindicate his character or to reclaim his child. On the first count he can answer plausibly enough that he cared little for the good opinion of a world that had treated him with cruel injustice; while as to the second, the explanation is still more plausible. It was all the fault of those lying newspapers; and if they will print false intelligence, no one is bound to verify it. And when Mr. Gordon does reappear in his native land, he is a father any girl may well be proud of; nor do his manners appear to have deteriorated from long association with the Kafirs. It is true that mere roughness of manner need not stand in the way of a man with a highly sensational story becoming a lion in the best society in London. But Mr. Gordon vindicates the nobility of his nature by the extreme generosity of his financial arrangements for the benefit of those who had befriended Mara.

Mrs. Chetwynd differs from most lady novelists in treating her love-making suggestively rather than in elaborate detail. There are few tender scenes, although, in the case of Mara, there is a great deal of impassioned feeling; while sundry marriages which we hardly had reason to expect are hurriedly made up towards the close of the story. The episode which explains Mr. Herbert Pierrepont's temporary aberration from his beloved Mara is original, if somewhat fantastical. But the author succeeds in acquitting him of anything more serious than chivalrously yielding to his amiable impulses; so that, when he has redeemed his fault by good works as well as penitence, he is not unworthy of being restored to Mara's favour. It is true that he has engaged himself in the interim to a great heiress; but he has not been tempted by the heiress's money. Olive Hume, having fallen in love with him, has subsided into his arms in a fainting fit; and, when his aunt surprises them in that compromising attitude, he thinks to spare the girl's feelings by proposing on the spot. As it happens, Olive is "queer" beyond the verge of insanity, and in a mystical and very mysterious frame of mind has mistaken Pierrepont for another gentleman who had captivated her fancy before. When the sitting cloud lifts from her entangled brain, she is only too glad to restore to him his freedom. They separate, much to their mutual relief, and Olive finds a more suitable husband in a clever young mad-doctor, who charges himself with the responsibility of her happiness and cure. It was merely by a very remarkable coincidence that he and Mr. Pierrepont must have resembled each other as closely as the famous Corsican brothers. But although not a few of the incidents, as we have demonstrated, are either commonplace or far-fetched, we can conscientiously praise Mrs. Chetwynd's story as abounding in interest and in ingenious character-sketches.

#### HOUSES AND HAUNTS OF THE ITALIAN POETS.\*

THIS collection of sketches does not pretend to give any complete account of the works and literary lives of the poets whose names are included in it, neither does it profess to be a selection of names taken entirely according to their claims to rank as poets of Italy. It must be accepted rather as a series of pleasant and readable essays, which do not assume to have much critical importance, and which to a considerable extent take the form of tracing the life of the particular poet to whom each article is dedicated, under the conditions of the whereabouts of his birth, death, usual residence, and peregrinations. A distinguished and witty peer, who has served his country in divers high posts, and is now representing Great Britain at the Sublime Porte, once cut short a discussion on the accuracy of the positions of places as described in the *Iliad* and *Odyssey*, by an amusing assertion. He said:—"Surely a poet who was himself born in so many different places as Homer was, ought to know a good deal about geography." Nevertheless, the geographical method of treating a poet's life does not seem to be the most appropriate one, considering that no other poet is known to have possessed such claims to be remarkable in

this way as Homer enjoyed; but it affords as good a thread, perhaps, as another upon which to string together loose beads of biographical fact and anecdote, and the result in the present case is an agreeable one. The title, too, is avowedly borrowed from the well-known work of William and Mary Howitt, to the survivor of whom due acknowledgment for the loan is made by the authors of the present volumes.

In the case of Dante, the question most interesting to Englishmen about his wanderings must always be, whether he was ever in England or not, and especially whether he was ever "up" at Oxford. There is no antecedent improbability that he should have fulfilled the natural wish of a scholar of the period to see and share the studies of a famous University; there is a time of his life more or less unaccounted for, during which the visit might have taken place; and Dante is known to have been at least as near to England as Paris. To this discussion a most valuable contribution has recently been made by Dr. Plumptre, the newly appointed Dean of Wells (*Contemporary Review* for December). The supposed proofs are indeed slight enough; but at any rate there is no positive proof that Dante never was in England. Except a vague allusion, metaphorical probably, made in a letter in Latin verse from Boccaccio, the evidence collected by the Dean in support of the English visit is nearly all to be found in passages from the *Divina Commedia*. And it is true that the references in the *Commedia* to places where Dante is known to have been are as faint as those relied upon as evidence of his having been in England and at Oxford. The probability of a residence at Oxford is made chiefly to depend upon Dante's intimate acquaintance with the physical works of Roger Bacon, who was teaching at Oxford at the time when Dante's visit was most likely to have taken place, if it ever occurred at all. The comparison of several passages in the *Commedia* with extracts from Roger Bacon's *Opus Tertium* goes some way to show that Dante must at least have been well acquainted with that work; but it hardly seems to follow that, because the poet was well read in the writings of the great physical philosopher of the middle ages, he must have been his pupil at Oxford. Roger Bacon was well known in Paris, in which place it is certain that Dante spent some time. One result of this was that he gave an immortality to Sigier, his teacher there—by the mention made of him in the *Paradiso*—a personage who would have been otherwise unknown to fame. The Dean's reasons given to account for a similar honour not being conferred upon Roger Bacon, if Dante had also ever sat at his feet at Oxford, are not satisfactory. But the whole argument is one to which every Englishman must wish success; and it is gratifying to learn from the article referred to that the Dean is himself engaged upon a translation of the *Commedia*.

The notice of Petrarch, as well as that of Vittoria Colonna of Tasso, Alfieri, and Giuseppe Belli, are due to the pen of Mr. Trollope. Many of them contain very beautiful descriptions of towns and natural scenery, among which those of Orvieto in autumn and Sorrento may be especially noted; and all are written in a spirit of devotion to her subject which sometimes, perhaps, leads to a rather excessively florid and fervent style. It is scarcely allowable in English prose to write "what time" instead of "when," even in writing about a poet. Nor is it quite right to speak of "corrupt mediæval Latin," considering that the language which was the usual vehicle of intercourse among the educated classes, if not absolutely Ciceronian, was by no means devoid of merit, even in literary style. The name of Fracastoro, too, is mis-spelled the famous physician and poet, who wrote a certain Latin poem upon a subject only suited to a medical nurse.

The notice of Petrarch, together with those of Michael Angelo and Vittoria Colonna, ought to have some effect in reviving in England the taste for the good and pure examples of Italian poetry. The cultivation of Dante in England, Germany, and America wants no stimulation at the present moment. Editions and translations of the *Commedia* are almost perpetually appearing. In England the late Lord Vernon expended large sums upon printing the text, as well as upon publishing illustrations and commentaries; and quite recently there has been a generous rivalry between England and a Dante Society in one of the most famous Universities in the United States for the honour of printing in its integrity and in the Latin original the important commentary of Benvenuto da Imola. But the rest of Italian poetry is now sadly neglected—for sufficient reasons, unfortunately, as to much of it. Yet, in addition to the older poets already mentioned, there are many more recent ones, whose names need not be mentioned, and whose works are altogether fit for the drawing-room and the boudoir. Metastasio, once a favourite, is now unduly despised; and it is to be regretted that a place was not found for Leopardi in the present collection.

To Berni scanty justice is done. There is too much said upon the faults of his private life, and upon the undesirable character of many or most of his lesser performances. But the fame of Berni rests upon the *Orlando Innamorato*, as reconstructed from the previous poem by Boiardo of the same name; and the place always awarded to this poem in Italian literature by the most competent judges, as well as by general favour, can leave no doubt of Berni's right to take a high rank among the poets of his country. Nor does Mr. Trollope sufficiently describe the extraordinary and perhaps unique phenomenon of such a reproduction of the poem of another writer. Indeed he almost seems to doubt the propriety of including Berni in his collection, and even ventures to say that the sole value of his writings now consists in the contribution they

\* *Houses and Haunts of the Italian Poets.* By Frances Eleanor Trollope and T. Adolphus Trollope. London: Chapman & Hall. 1881.

afford to a picture of the manners and morals of the time and country in which he lived. He quotes, however, as a specimen of his fine humour the well-known lines on the government of Clement VII. :—

Un papato composto di rispetti,  
Di considerazioni e di discorsi,  
Di più, di poi, di ma, di sì, di forsi,  
Di pur, di assai parole senza effetti.

The subject of Parini's chief poem, "Il Giorno," which is a satire upon the various occupations and supposed duties of a fashionable day of the period, gives a fair occasion for enlarging upon the follies and frivolities of the latter end of the eighteenth century. The *Cicisbeo* then flourished in the plenitude of his foolish, tedious, and objectionable existence. The absurdities of dress were at their height; massive brocades were sustained upon expanded hoops, the use of powder for the hair was universal, and the patch was still worn. The materials were ample for an attack upon the ways of society in Milan, and Parini made such good use of them as to secure for his poem a considerable amount of popularity, and to entitle him to take his post on the lower slopes, at least, of the Italian Parnæus; but the place is a mediocre one, and such fame as Parini enjoys can only be explained by the local and temporary circumstances which gave a transient vogue to the "Giorno." It is now very tiresome and uninteresting reading.

It was Giusti who brought back to Florence the honour of holding the greatest living poet of the age. He was a poet of politics, and he was no unworthy successor to the great Florentine who centuries before had also struggled for a revision of the political conditions of Italy. He had the same earnestness and the same deep convictions, although in a different sense, as had belonged to Dante; but he lived to witness at least the partial triumph of the principles for which he contended; and he died and was buried with honour in the church of San Miniato, in the city from which his great master in poetry had been expelled. The writings of Giusti deserve greater attention than they have yet received; although his name is known and held in high esteem by all who have taken any pains to become acquainted with recent Italian literature.

The essay devoted to Boccaccio is by Mr. Trollope, as also are those on Danto, Ariosto, Michael Angelo, Berni, Guarini, and Parini; and this is on the whole the best and perhaps most needed of all those in the volumes before us. It will be of use in correcting the erroneous popular impression, founded upon insufficient knowledge, of the character of Boccaccio's writings—and especially of that of his principal and best-known work. Mr. Trollope remarks that an English reader may be well struck by the exaggeration both of praise and blame awarded to the *Decameron* in Italy. Its stories are deficient in many of the points which would now be necessary to give interest to fiction—a want which they share in common with other similar productions, until the modern novel came to assert itself in all its present importance some centuries later. The tales in the *Decameron*, however, are too short to run the risk of being tedious, and are nearly all founded upon existing materials. The love of scenery did not exist in Boccaccio's first readers, and could not be appended to even by a writer who possessed it himself; and the prevailing want of human sympathies, common to the age, is seen in the hard and cruel tone of so many of the stories. Mr. Trollope refutes the vulgar notion that the *Decameron* is a mere mass of licentiousness, and points the difference between indelicacy and viciousness, from the latter of which the writings of Boccaccio are far more free than many modern productions of the French press which are duly entered in the catalogues of our circulating libraries, and may be seen lying upon many a drawing-room table.

The "Vittoria Colonna," too, of Mrs. Trollope furnishes much interesting matter about a lady of whom it is well that ordinary readers should have the opportunity of knowing more than is generally the case; and altogether these volumes, as jointly produced by two persons who know Italy, its literature, its scenery, and its cities thoroughly well, and who are familiar with Italian life and manners, deserve to be generally read.

#### RECORDS OF THE PAST.\*

THE close of the first series of the English translations from Egyptian monuments, published under the sanction of the Society of Biblical Archaeology, affords an opportunity of noticing the result. Whether the members of the Society will see their way to the publication of a fresh series, or content themselves with the transactions at their meetings, will naturally depend on the support the first series has received. On this head we have no precise information, but we may assume it as more than likely that the undertaking so far carried out will not readily be allowed to drop. We are, therefore, perhaps the more inclined to criticism. A new series should be an improvement on the old one; and that the old one has faults—some of them by no means of a venial character—it will be our duty to point out. In the first place, however, it may be well to give some account of the contents of the six volumes which contain the Egyptian records, passing over, at least for the present, those which relate to Assyria. In the preface "it is hoped that sufficient interest will be aroused to the value of this work to cause the whole, or at all

events all the most important texts of this ancient literature to appear in their translated form." In this somewhat oddly worded and punctuated sentence we have a summary of the objects of the series. The first Egyptian volume, then, contains one translation from the period of Pyramid Builders, or, to use the French name, the Ancient Empire; one of the middle period, or Twelfth Dynasty, and some dozen or more of later origin. The second Egyptian volume (vol. iv.), contains no early records, but is taken up for the most part with the history of Thothmes III., of the Eighteenth Dynasty, and some other pieces of later date. The third volume (vol. vi.) contains, besides the translation of one of the Beni Hassan grotto texts, fifty pages devoted to the great Harris papyrus relating to the annals of Ramesses III. The fourth volume completes the Harris manuscript. The fifth has a very varied table of contents, ranging from a stale of the Eleventh Dynasty to a Ptolemaic marriage contract. The last volume, concluding the series, has nothing earlier than some translations from Beni Hassan, and is not arranged chronologically. This chronological arrangement is evidently a difficulty all through the six volumes, and little or no assistance is afforded to the student who would try to distinguish between various periods and styles, while the early inscriptions are wholly omitted in spite of their transcendent interest. There is one inscription of the very end of the pyramid-building period, and no more. In fact, an unprejudiced reader, especially one unacquainted with the earliest Egyptian literature, would suppose that instead of being very abundant it was very rare—the more so because, on turning to Dr. Birch's volume of texts as exercises, he will only find this period represented by a passage from the celebrated Sphinx tablet, certainly a forgery or imitation of a comparatively later time.

If we examine the several pieces we find the same fault very apparent. There is a total failure to distinguish the periods. The Ptolemaic marriage contract referred to above has, except for its being written in the half-hieroglyphic style known as Demotic, a Greek rather than an Egyptian interest, and throws no light whatever on the usages of the "Ancient Egyptians," of any period, in respect of the celebration of nuptials. It is preceded in the volume by a translation from a tablet of the time of Alexander Ægus, and succeeded by a passage from the sarcophagus of Seti I. in the Sæne Museum. A mixture like this is very difficult of digestion, and the difficulty is greatly enhanced by the different and even contradictory systems of transliteration employed. The principal duty of an editor, it might have been thought, would be to obtain and preserve some kind of uniformity in this respect; yet we find in some of his own translations the same name spelled in various ways. The very curious system of French transliteration invented, and for some time used, by M. Chabas, if we are not mistaken, and not yet unfortunately quite abandoned, appears in volume ii., where M. Pierret translates a passage from the tablet of Nefertotep, whose name, consistently with the old system we have mentioned, he gives as Nefert-hotep. This change of *f* into *x* is the more gratuitous as the Egyptian *f* is one of the few invariable letters, there being but one form of it, and that identical with our modern letter, and probably the Greek *φ*. M. Pierret is the remarkable Egyptologist who calls Shoshoon *Khouwon*. The want of critical notes by a competent editor is very apparent all through the series. Thus, in the sixth volume we have Mr. Goodwin's translations of four hymns, and the notes are of the most meagre kind. Three of them are addressed, it is asserted, to Amen. This fact alone, if it is a fact, should have been mentioned or confirmed in a note. A tolerably extensive acquaintance with Egyptian religious inscriptions will probably fail to find another example. In the second of these hymns, moreover, there is evidence that Amen-Ra is addressed, and in the third Amen-Toom or Amen-Hor. If we assume, therefore, that the first of the three is also addressed to Amen-Ra, or possibly to Amen-Noom, we shall be almost certainly right. There is a futile sort of note at the end about "Amen, Horus, and Tum," and their identity with the sun, which betrays a strange state of mind on Egyptian mythology; not that there is anything actually wrong in it, but a naïveté which may be that of ignorance. The result of this kind of editing on the value of the whole series is most disastrous. We are everywhere in doubt. It would be impossible to assert anything as a fact on the authority of *Records of the Past* alone. This is a great pity; so much time and trouble have been spent on the work that one is tempted to think the little more required to make it valuable should not have been wanting. It is much to be hoped, therefore, that if a second series is started it will contain the original text of each piece in hieroglyphs, a proper apparatus of critical notes, a complete index to each volume, and something in the way of chronological approximation for each article a little more precise than in any of the prefaces before us. There is plenty of work still to be done, though competent translators are few. The first series should not have been brought to a close without an example of the sepulchral inscriptions of the early Pyramid period. The book of the maxims of Ptah-hotep, "the most ancient book in the world," as M. Chabas calls it, has not been adequately translated into English. The new discoveries of inscribed pyramid chambers at Sakkarah offer an almost inexhaustible store of the early texts, while Herr Brugsch's now famous find at Thebes might provide material for a number of series like this.

We have perhaps been inclined to judge *Records of the Past* a little more harshly because it is so near being a considerable success. If it had turned out altogether worthless we should not have needed to bestow so much time on it. A certain amount of

\* *Records of the Past*. Vols. II., IV., VI., VIII., X., XII. First Series. London: Bagster.

interest evidently exists in Egyptian literature. Some day even the English Universities may think it worth while to study the most ancient classics. These *Records* will not mislead any one, but they will lead him only a short way. A much more solid publication is required for the instruction of the public. We cannot expect books like this to be popular. They are not, in fact, intended for general, or, so to speak, family, reading. The ordinary reader wants less than is here given, the student wants more. If Dr. Birch and his coadjutors merely aimed at amusing, a much less pretentious book would have sufficed. Paraphrases rather than translations, and a careful avoidance of critical notes, would have been needful. But if the work is to be useful to people who are not content with mere amusement, it will be necessary very considerably to increase its scientific character, and to give the reader some means of judging for himself, in disputed passages at least, if not in all.

We have, so far, said little as to the contents of these volumes. Yet they are, for the most part, of the highest interest. The first volume opens with the account of a voyage made by one Una, who was sent by King Pepy, of the Sixth Dynasty, to fetch him a granite coffin from Assoonn. The coffin was found a few months ago in the pyramid named Men-Nefer, or "the fair abiding place." Una's monument is in the Boolak Museum. The second paper is even more curious. It is a translation by M. Maspero of the instructions left by King Amenemhat I., of the Twelfth Dynasty, for the use of his son and successor, King Usertesen. Out of six copies of the document on papyrus in different collections only one is complete, and that is most incorrectly written. At the most moderate computation, the early kings of this dynasty must have flourished 2,000 B.C. Amenemhat's teaching would do honour to any monarch. "Let concord," he says, "be between thy subjects and thyself"; let not the landed lords and noblemen be thy brothers to the neglect of people whose friendship has not been long tried; no one was hungry owing to any deed of mine, no one was thirsty; the orders I gave increased the love of my people. Such are his maxims, interspersed with anecdotes of his personal adventures and conquests, and of the magnificence of his palace, or possibly of his tomb. Among the romances we find a version of the celebrated "Tale of Two Brothers," which in many particulars resembles the history of Joseph. It is taken from a roll which once belonged to Seti II., the supposed Pharaoh of the Exodus, and may therefore really embody some legend of the patriarch, with additions of native growth. The story of the prince doomed to die by a crocodile, a serpent, or a dog, is more purely fictional in character, but the manuscript, which is inscribed on the reverse of a papyrus in the British Museum, is unfortunately imperfect. The most interesting paper in the next volume is an account of an embassy from the King of "Bakhten," perhaps Assyria, to Ramesses XII., one of the last kings of the Twentieth Dynasty—here called, by the way, the Twenty-first. The Asiatic king had a daughter subject to some illness ascribed to demoniacal possession, and the object of the embassy was to borrow an image of Shonsou, or Khons, the god to whom the kings of that time were particularly devoted. The princess was younger sister to the Queen of Ramesses. It seems to us improbable that even at that late period the Egyptians worshipped an image, and it is more likely, even from the English version, that not an image but the sacred animal—a hawk, perhaps, which was at the time regarded as the incarnation of Shonsou—was sent. Here a few lines of the original text would obviously be invaluable to the student. The princess was cured; and after three years, four months, and five days, the god, "like a golden hawk," went back to Egypt, the Asiatic king having dreamed that he came out of his shrine and flew away. In the next volume is a translation of the history of Aahmes, the son of Abana, from his tomb at El Kab. Aahmes lived under the last kings of the obscure dynasty which preceded the Eighteenth, and is variously reckoned as the Thirteenth and Seventeenth. Another interesting document of this time is unfortunately imperfect. It appears to describe the commencement of the struggle for independence between King Apophis or Apapi, a Hyksos of Lower Egypt, and a representative of the old royal race, a prince of Thebes, whose name very well illustrates the difference between the English and French systems of transliteration, for Dr. Lushington, the translator of the fragment in *Records of the Past*, calls him Sekenen Ra, and M. Maspero Soknounri. His body is among those recently discovered at Thebes. We may add, in conclusion, that a so-called index, appended to the last volume, is utterly useless.

#### BETWEEN THE AMAZON AND THE ANDES.\*

A MAN who, of the ten years that he had lived in another continent, had spent no small part in wandering through it; who in one tour alone had travelled nearly six thousand miles; who had seen strange lands and strange rivers; had run great risks of many kinds; and who, on his return home, had taken only 238 pages of large type to tell his story, would deserve the thanks of all readers. A woman of whom the same can be said is almost worthy of being held up as a model to her sex for all time. Mrs. Mulhall modestly says in her preface that her sketches

of travels and adventures possess no literary merit. They have, at all events, one merit—and that a literary one, too—of which few books of modern travel can boast. They contain very little that ought to have been left out. They are singularly free from impertinences of all kinds. We do not deny that there are here and there passages which are over-minute, and which are therefore somewhat dull. These are chiefly to be found in the latter part of the book, where she is describing her voyage up the Parana. She was on a steamer, and so could keep a diary. Hence her descriptions are sometimes a little too long. Nevertheless, her book, as a whole, is very readable and very instructive. The title certainly is most misleading. At no point in any one of her journeys could she fairly be described as being between the Amazon and the Andes. She once reached the watershed of a stream that flowed southwards into the Paraguay, and of another stream that flowed northwards into an affluent of the lower Amazon. That this affluent, by the way, could have been, as she maintains, the river Arinos we greatly doubt. She reached, she says, the dividing ridge after a one day's excursion on the back of a cow from the town of Cuyabá, and she returned the same evening. According to Keith Johnston's map (of the year 1877) she must have travelled not much less than four hundred miles thus mounted in less than twenty-four hours. She saw, we imagine, a feeder of the Xingu, which flows into the Amazon not far from its mouth. Be that as it may, with the Amazon her book has really nothing to do, and not much indeed with the Andes. As a more accurate title, we would suggest "Between the South and the North Pole," or—to be a little more confined in our range—"Between Cape Horn and the Isthmus of Darien." While we are noticing inaccuracies we must point out a strange exaggeration into which the author falls when she says that the Nile is only a stream compared with the Parana. Not many lines lower down we learn that, though this river was about a mile wide, nevertheless it was very shallow. When she has ascended it to the tropical regions, she mentions that there was no cold drink to be had. "Everything was lukewarm. The river water was almost hot enough to boil an egg." From lukewarm to a point not much short of egg-boiling is indeed a great stride. She quotes a story about a talking parrot that had belonged to Prince Maurice of Nassau, and gives Sir William Temple as her authority. Had she turned to the Memoirs of that acute and somewhat sceptical writer, she would have seen that he placed no trust in the tale. He does not doubt Maurice's wish to be truthful. "I dare say," he writes, "this prince at least believed himself all he told me, for he ever passed for a very honest and pious man." But then, as he found out by questioning him, the parrot had only been able to speak Brazilian, while the Prince only spoke Dutch. The conversation, therefore, had been carried on through an interpreter. "I leave it," adds Temple, "to naturalists to reason, and to other men to believe, as they please upon it." Our author falls into another strange blunder when she says that an old colonel whom she met in Paraguay had made his first campaign in 1826, and then "had fought for Poland until the death of Kosciuszko." Has she forgotten how Campbell, in his *Pleasures of Hope*, before the close of last century, celebrated the fall, though not the death, of the great Polish patriot? Kosciuszko had been dead thirteen or fourteen years before the war broke out in which Mrs. Mulhall's colonel took part.

The book opens with a very striking sketch of Buenos Ayres, not as it is now, but as it used to be. "It has lost its charm of originality," she writes, "since the inroads of commerce and civilization have assimilated it to the commercial cities of Europe and the United States." Some of these charms were of a very doubtful kind, while even now the inroad of civilization has not been so overwhelming as to leave no remains of ancient savagery. "There are seasons," we read, "when crime assumes an epidemic form, just like an inroad of fever. Every morning you will hear of two or three horrible affairs. . . . The period before an election for Governor or President is always one of trouble and bloodshed." It is but ten years since the plague swept over Buenos Ayres, and carried off twenty-six thousand persons. This was caused, no doubt, altogether by the shocking neglect of the commonest decencies of life. A committee was appointed to inquire into its origin, but nine years have passed and it has not yet published its report. Mrs. Mulhall's history of this plague is as interesting as it is painful. She and her husband were living in the town when it broke out, and were some of the last to flee. The Municipal Council at first tried to hush up the rapid rise in the death-rate. The Carnival was kept up with great pomp:—

Sunday was the first day of Carnival, and the crowds of masqueraders went about throwing sweets, flowers, and costly presents at the ladies in the balconies. The Corso, comprising three of the principal streets, was four miles in length, hung with banners, and having a triumphal arch at each point where streets crossed. Between the hour of noon and that of the Ave Maria (half-an-hour after sunset) more than 1,000 carriages and 10,000 horsemen dressed in splendid costumes passed along. There were crusaders, warriors of the epoch of Cortes and Pizarro, Indian caciques, and every fantastic style of mounted cavaliers. The same pageant took place on the second and third days, and when Carnival concluded, everybody was pleased that it had passed off so well, especially the fireworks of the Municipality.

During these days of rioting the newspapers had not appeared. But on Ash Wednesday they were published once more, and then it was learnt that the deaths from the plague had risen to forty daily. A panic seized the city; people flocked out of town; all the members of the Municipal Council fled, and the price of a wagon and team of horses was paid for a single day's hire of them.

\* *Between the Amazon and the Andes; or, Ten Years of a Lady's Travels in the Pampas, Gran Chaco, Paraguay, and Matto Grosso.* By Mrs. M. G. Mulhall. With Maps and Illustrations. London: E. Stanford. 1881.

Along the great highways gipsy encampments were formed wherever a clump of trees or a ruined house gave any shelter. Even the waiters in the coffee-houses turned carpenters and made coffins, while some of the lawyers bought up every cargo of timber. The rudest coffin before long cost ten pounds, and a terror which seized on the people at the thought of being buried without one increased the danger of the disorder. On Easter Monday the number of those buried was one thousand and eighty. The dead were day after day carried off in the dust-carts. On some of the railways the trains no longer ran, as the engine-drivers had been all swept away by the plague. The market people were afraid to enter the town, and a scarcity of food set in. In the street in which Mrs. Mulhall lived there was no sickness till the beginning of March. "One morning," she writes, "about sunrise I heard the toll of the acolyte accompanying the priest to visit the dying. That evening three coffins were taken from a house in front of ours, and an hour afterwards the police proceeded to burn the furniture. . . . Every morning the disinfectors came round to sprinkle the house with a mixture of coal-tar, saying at the same time 'May God keep you from the plague.'" Some cold days in March checked it a little. "I never saw more lovely autumn weather; such a contrast to the awful tragedy that was being enacted on all sides." But the hot days returned, and the death-rate rapidly rose. The banks were all closed, and the Mulhalls could get no money. An English grocer who had not fled trusted them, and sent them a supply of tinned food. Matters grew still worse. "The town clock in the Plaza had stopped. Grass grew in the streets. Dogs roamed without owners. A dead silence reigned, unless when the rumble of the dust-cart was heard, with the cry of the half-drunk cartmen, 'Bring out the corpses!'" Most of the physicians had died, while many of the apothecaries had fled, for a rumour had spread that they were selling poison, and some of them had been shot at. "In Holy Week a Government decree was issued, closing the post-office, telegraph offices, and other public departments, and ordering all shops to be shut for thirty days in order to compel the remaining inhabitants to leave the city." In the middle of April the Mulhalls themselves took flight, but they soon doubted whether they should not have done better to stay. The best shelter they could find was in a mud-hut, where the frogs and toads were hopping over the floor, and where the rain came in so fast that they had to keep their umbrellas open over their beds. To make the matter worse, they were told that the husband of the woman whom they had hired as a servant was "indebted for six deaths," which meant in English that he had murdered six persons. He was, however, "always most respectful" to his wife's new master and mistress. By the middle of May they could endure their misery no longer; the death-rate, they heard, had fallen to below one hundred, and they returned to Buenos Ayres. On entering the town they saw some fifty men cutting open mattresses which had been sent to be burnt as being infected. Often, it was said, large sums of money were found concealed in them. In one street they saw a man selling coffins, "the best omen that the plague was abating, as the supply was equal to the demand." Mr. Mulhall was stopped by the police as he was carrying a bundle of cloaks and rugs. They were on the look-out for robbers, they said, who were plundering the empty houses. Our author thus concludes this chapter of her work. "Before many weeks the plague was as utterly forgotten as if it had occurred in the previous century; and the foundations for a new opera-house were laid on the site of a sawmill used for making coffins during the epidemic."

Mr. and Mrs. Mulhall made Buenos Ayres their headquarters, whence from time to time they started on their tours, first in one direction, then in another. Few parts of the narrative are more interesting than the account the author gives of the German settlements in the south-eastern districts of Brazil. In one province there are 60,000 Germans, who "preserve the warmest recollections of the Fatherland; and, in language, sentiment, and traditions, are as true to their native country as if only travellers in a strange land." She heard the "Wacht am Rhein" sung as her steamboat drew near the shore. She thus describes one of these colonies, which are, she writes, forty-four in number:—

Imagine a country nearly as large as Belgium or Holland, cut out of these Brazilian forests, where the inhabitants are exclusively German, and speak no other language; where chapels and schools meet you at every opening in the wood; where the mountain-sides have been in many cases cleared to make room for cornfields; where women travel alone through the forest in perfect security; where agricultural and manufacturing industry flourish undisturbed; where crime is unknown, and public instruction almost on a level with that of Germany; in a word, where individual happiness and the welfare of the commonwealth go hand in hand, surrounded by the rich tropical vegetation of Brazil, and favoured by the great advantages of a healthy climate, and the blessings of peace, order, and good government. The main street of some of these villages is lined with orange-trees. The houses are models of neatness. The better kind are of bricks, with a wooden half-story under the sloping roof. Many, however, are of mud and cane, or made in a species of framework, with the large cross beams conspicuous, as in most of the hamlets of Germany. Beneath the cottage, however humble, is a basement, used for implements, which keeps the houses very dry. No bars or bolts are visible, and the windows are often without glass.

She met in her wanderings settlers from many countries. She dined with a Welshman—Mr. Jones by name—who could speak Welsh, but had never learnt English, and with whom she had to talk in Portuguese, to the great amusement of a Brazilian gentleman. In a Don Tomas Fernandez, who gave her a welcome to his comfortable home, she discovered a Mr. Flanagan from Mallow. He could still speak English, though only imperfectly. In this he

was better than a Scotch Governor, who had utterly forgotten his native tongue. "The number of Scotchmen, or men of Scotch descent, holding high places in these countries, is surprising to a stranger." A Swiss colony, though on a much smaller scale than the German settlements, was no less thriving. Prosperous though some districts were, yet in most of the vast countries through which our author travelled the insecurity of life is still so great that for years to come the settlers will have a hard time of it. She was invited to be present at the opening of a new line of railway. There was, indeed, a venerable bishop to bless the engine—which, by the way, some wild Indians had once tried to lasso—but some miscreants the night before had sawn the beams that supported a bridge, and so the train could not run. In another district a Frenchman laid out the money which he had made in the country in building a fine stone bridge of three arches where no bridge had ever been before. He was murdered by a "gaucho" who refused to pay the toll. Murders, in fact, seem to have been almost looked upon as one of the everyday incidents of life. A murderer's punishment was commonly temporary confinement in a prison, where he spent his time in playing cards with his fellows. One wretch whom our author saw thus engaged had, she was told, killed fifteen people, some of them merely for the sake of the silver buttons on their belt.

Had we more space at our command we should invite our readers to accompany us as we followed Mrs. Mulhall in her wanderings to the Andes and to the upper waters of the Paraguay. They must read her book for themselves. They must not be deterred by a certain baldness of style; for they will find by way of compensation that, if it has no literary charm to give it a grace, it has that great merit which belongs to a narrative that is plain and straightforward, and free from all affectation of fine writing and of word-painting.

#### LOIS LEGGATT.\*

IT is a pious opinion among writers of the school to which Mr. Francis Carr belongs that wills are written and executed on parchment. With Mr. Carr himself this belief has passed beyond the region of opinion, and is to be received as *de fide*, the central truth on which the story of *Lois Leggatt* depends. For the logical working out of its catastrophe or conclusion another proposition is evidently required, and the syllogism—in *Celestine*, if we remember our Aldrich—is complete. This proposition has been formally stated in poetry to which some seventy years of time have now given classical authority; and in view of the warning to "critics" contained in the author's introductory chapter, we will venture to supply the omission of the customary poetical motto on the title-page by the quotation:—

Al! bootless aim! the critic fiend  
Is judged in his turn;  
Parchment won't burn!

Sentence of judgment upon "the critic fiend" who shall presume to review *Lois Leggatt* is passed by the author through the means of an ordinary literary artifice. Miss "Elizabeth Kentfield," in her double capacity of autobiographer and editor of her sister's papers, knows exactly what "the pens of critics" will write concerning the work, "I shall not hear comments on it—but I shall see the reviews." She penetrates beneath the "scornful analysis" of their written words, and exposes in all its naked hideousness what "the critics may even feel." For ourselves, we honestly declare that we neither "say," "know," "profess," nor "feel" any single thing or thought which the author attributes to us; and in respect of the major premises of her or his argument—that is to say, that "parchment will not burn"—we are in entire agreement with Miss Elizabeth Kentfield and Mr. Francis Carr, or with either of them severally. The bearing of this physical law upon the fortunes of the characters and the succession to landed property is not quite so clear.

Through three-fourths of the volume the author's purpose appears to be merely one of instruction in the form of dialogue or soliloquy, preserved by means of journals or personal recollections. At last, about one hundred pages from the end, indications are discoverable of something in the nature of a plot, which may be briefly stated in outline. Some six years before the time at which the story opens, old Mr. Charlecote of Crawford lived in possession of a landed estate, a son, a nephew, an armchair with a drawer under its seat, a family nurse, a family lawyer who was also a family friend, and two wills, which he kept in the drawer under the seat of the armchair. "The very night he died" he called to the nurse and told her to bring him both wills; which she did. Then he told her to put the later will on the fire, which she did not. She put the earlier will on the fire; but "the flame was low," and the "master was taken with fainting fits," "and the parchment was hard to burn," so she "took it off the fire and hid it." It is said that a burnt feather is a sovereign specific for "fainting fits," and the odour of "blackened and scorched" parchment, certainly more objectionable, might reasonably have been expected to prove quite as efficacious; but the old man died, and Mr. Charlecote Charlecote, the nephew, succeeded under the later will, his cousin, the disinherited son, disappearing in a cloud of bad language, and transferring his disreputable person and life to an

\* *Lois Leggatt: a Memoir.* By Francis Carr, Author of "Tried by Fire," &c. London: Griffith & Farran.

Australian colony. The family nurse, as it happened, had been at odd times in her life engaged in the same capacity in all the families to which Mr. Carr introduces his readers; and in the earliest of these situations, when she was a "giddy girl of sixteen," had fallen down with the baby in her arms. Whether or not for the misdeed of her later life regarding the will "she ought to have been hung," as some one suggests, we could have wished that any penalty short of the extreme sentence of the law might have been assigned to her earlier carelessness, which resulted in inflicting upon the readers of "Lois's Story" an endless recurrence of disagreeable meditations on some undefined deformity concerning which the writer was perpetually tormenting herself and as perpetually talking to every one who was so unfortunate as to give her a chance of pouring the weary repetition into their ears. The author seems to entertain singular ideas of the habits in thought and speech of a refined and cultivated woman; for as such, even including the episode of a temporary lift, to say the least of it eccentric, in "the slums," he has certainly intended to represent his heroine. But then his hero is not of the ordinary masculine type. Mr. Charlecote Charlecote, during the six years of his enjoyment of the Crawford estate, and as he appears in the story, is the idol of London, whom all the women worship, and with whom half the girls are in love. He never does anything, it is true. He never visits his estate, and we learn incidentally that he eschews and despises all things athletic, since, when we first make his acquaintance, he is evidently and hopelessly out of condition. He is "both flushed and exhausted" by the labour of drawing a Bath chair with a lady in it up a hill, though another lady was helping him by pushing behind. "Heat beads stood on his brow" after the unwonted effort; "the muscles of his arms were not under steady control." His whole life and energies were, in fact, as we go on to learn, devoted to making love to a married woman. This passion was absorbing, vehement, irresistible, and perfectly pure, although this last characteristic was commonly overlooked by social observers, who "talked," as was not unlikely. The object of this consuming adoration was one of the "queens of society," with an elderly husband who was something in the City—"in the silk line"—extremely well dressed, and, as far as the reader can discover, without an idea in her head. In some interval of reason it occurs to Mr. Charlecote that he might as well spend his time in another way, and he flies from London to an out-of-the-way place on the south coast, where the only lodgings to be had were in a pair of semi-detached houses, one of which was at the time tenanted by Miss Lois Leggatt, in charge of her half-sister, Miss Elizabeth Kentfield, the former lady being the writer of the "journal," the latter of the "story," which together make up this volume. Here Mr. Charlecote is discovered and joined by his friend Bob Anson, an artist, who is in search of, and who finds in Elizabeth, a sitter for a companion picture to one which he has already in preparation for the Royal Academy. A year later this work in its double embodiment of feminine loveliness attracts all eyes in the Exhibition, under the appropriate titles of "L'Allegro" and "Il Penseroso." "Il Penseroso" is Elizabeth, at the time in a sort of widow's mourning, with sentiments to correspond, for one lover, but perfectly ready to supply his place with another, whether declared or hypothetical. The hero of the Bath chair has opportunely appeared, and the discovery that he is the new lodger next door is made "soon after eight o'clock" on an evening which is described by Lois as follows:—

The night was fair and divinely still; the star-studded sky looked cloudless, a crescent moon had just risen over the hills of Barrowtown, and hung trembling, as it seemed, between earth and heaven. Lights were twinkling in the distance, but where I walked the only illumination was that of the soft April night, of young moon, and of stars.

It is useless to expect a novelist to let the moon alone, though if by the help of his own eyes and the light of nature he cannot keep clear of such nonsense as this, he might at least take the trouble to consult an almanack. But a restless demon of blundering hovers round the path of Mr. Francis Carr, and at times even attracts admiration for ingenuity in leading him astray, as when he introduces a Bishop with a title taken from a county—"the Bishop of Eastshire"—a dignitary of a class hitherto unknown, we think, even to fiction.

It may be convenient to anticipate events in order to get the love business of the story at once out of the way. Mr. Charlecote does not offer his hand and heart to "Il Penseroso," as what he supposes to be the latter is already devoted to "L'Allegro," her first cousin. Elizabeth becomes tired of waiting at last, and writes a letter offering hers to him. This is nearly at the end of the volume, when he happens to be engaged to marry Lois; but he throws her over, and she vanishes first and then dies. Elizabeth carries off "her hero" in triumph, and passes from sight as she is on the point of "sailing away to a new life on a foreign shore" where "I shall see the reviews," and where also she intends to indulge in the pleasures of hope, because "Harold Charlecote's intemperate habits are rapidly undermining his health, and Charlie is his heir-at-law." As the bride expectant's "fancy lightly turns to thoughts of" law from those of love, we may try to follow her as best we can.

Old Mr. Charlecote had died as already related, and his nephew had inherited under his latest will. According to the usual course in the case of wills not executed on parchment, the instrument must have been proved, probate issued, and succession duty paid at the rate of three per cent. by Mr. Charlecote Charlecote, two

thirds of which we may safely assume that the Exchequer did not see its way afterwards to refund. The probate so issued, to which some innocent sheep had now really contributed its skin, was "the hero's" evidence of title to the possession of the Crawford estate. Six years later, Mrs. Hammond the nurse, having first relieved her conscience by the confession to Lois that she had dropped her as a baby, goes on to make an entirely clean breast of it by the revelation as to the earlier will in favour of the son, and by the production of its "scorched and blackened" form. This confession she repeats to Mr. Charlecote, who at once, after a stormy interview with Mrs. Lushington (L'Allegro), "disappears, leaving no trace behind him," having "given up everything he possessed unconditionally, and placed the whole affair without reservation in the hands of the family lawyer." His subsequent fortunes may be followed by any one who cares to know them; we are concerned only with his "disappearance" and its attendant circumstances, the whole of which were compressed into a space of about nine hours. "He paid Mrs. Hammond what he owed her"—she was his house-keeper—"in gold and silver, saying that it was no longer in his power to draw a cheque." As it is possible to extract some sense out of this statement by assuming Mr. Charlecote's banking account to have been already overdrawn, we will make the author a present of the hypothesis, which, we are satisfied, never occurred to him. "He"—Mr. Charlecote, not the author—"said that he was dead to all the world now," and "vanished into the night." Not very long afterwards Mrs. Hammond died; but in the meantime Harold Charlecote had entered into possession of the estate.

By what process known to the law this transfer had been effected the author does not think it necessary to explain. That the Probate Court would without any evidence—for not even Mrs. Hammond had given any—revoke the original grant upon the unquestionably last will of the testator in favour of the earlier will, is confessedly out of the question, and the rapidity and details of the hero's "disappearance" equally exclude the hypothesis of a deed of gift or voluntary surrender. If the author does not really suppose that a valid title to English landed property can be given by the production of an old will, which is known to be only so much waste paper—or parchment—"placed in the hands of the family lawyer," he has been at considerable pains to persuade his readers that he does so. One feeble ray of light may certainly strike across the general obscurity. The destitute hero, during the period of his engagement to Lois, proposed to emigrate to Australia, and "had no fear as to receiving the funds he required from the family lawyer, who had also been the family friend of the Charlecotes for so long." Family lawyers, as a rule, are not given to advance "funds" except on sufficient security; but if Mr. Hudson was all the while merely humouring the fancy of a client whom he knew to be a fool, and administering the estate on his behalf, with Harold as sham owner, the money "required" might have been forthcoming. On this supposition some rational termination might have been made to the story, if it had ever presented itself to the author. As it is, Mr. Charlecote is made by Mr. Carr to "restitute" all that he can from the income of his six years' "unlawful possession." We do not say that "restitute" is a bad word. On the contrary, it would by analogy be a very tolerable word, as words go, if only it happened to exist. But before Mr. Francis Carr takes upon himself the responsibility of adding new words to the English language, we should recommend him to learn to make a better use than he has done in *Lois Leggatt* of the words which its vocabulary already contains.

#### RECOLLECTIONS OF CURIOUS CHARACTERS AND PLEASANT PLACES.\*

IT is not unpleasant to be sometimes reminded by the appearance of a book of travel written with greater fidelity and wider knowledge than is usually found, how little we know of the world, and how large it really is. This is especially the case with the great continent of North America. It is a country which, from the enormous number of books written about it, from our own personal experience, and from hearsay, we seem to know so thoroughly, but in reality know so superficially. When we cross the Atlantic it is to hurry from one great city to another, from New York to Chicago, from Chicago to St. Louis; to stand agape before big hotels; to wonder at the growth of big cities. When we sit down to write our travels we hurl these cities with their thousands and millions of facts, bricks, and people at the heads of our readers. American cities do not, however, make up the whole, nor even a large part, of American life. Life in America is, as everywhere else, many-sided. There is one side of it—the country life—where the fatal dollar has little authority, and the people remain as quiet and as contented as the men of Laish. It is a side which travellers seldom see, and which the world never associates with the American character. We know something of it from the pages of Hawthorne, Holmes, and Longfellow; we may guess at something of it from American novels. Among these people, dwellers in the older States, quiet farmers, residents in the little towns, the descendants of the first settlers, there lingers yet the Puritanic spirit; they are, we gather from the best authorities, inordinately proud of their independence; they are also, we

\* *Recollections of Curious Characters and Pleasant Places.* By Charles Lannan, Author of "A Summer in the Wilderness," &c. &c. Edinburgh: David Douglas. 1881.

suspect, firmly persuaded that all things noble, all things great, all things splendid grow naturally and produce their finest flowers on American soil. The book before us is chiefly interesting from the glimpses it affords of these quiet places. For instance, who among us knows anything about Block Island? It lies at the junction of Long Island Sound and Naragansett Bay, among a whole group of islands and peninsulas, and opposite to a picturesquely broken coast which no English travellers have visited; it was here that Dana laid the scene of his story, "The Buccaneer."

The island lies nine leagues away,  
Along the solitary shore  
Of raggy rock and sandy bay,  
No sound but ocean's roar,  
Save where the bold wild sea-bird makes her home,  
Her shrill cry coming through the sparkling foam.

It is nine leagues from Newport, and is nine miles long; it is inhabited by a thousand people who farm and fish and are "wreckers"; that is, they do not encourage and stimulate the wrecking of ships, like former professors of wrecking, but they assist ships that are wrecked; they are a clannish race, they are fond of religious exercises, and entertain a healthy contempt for politics. They are excellent boatmen, and build their own boats, which are said to be the safest in the world for rough weather. They are described as being "sharp at both ends, deep, from fifteen to thirty feet long, and carry much ballast, have one or two sails, but never a jib, and always open, very stout, range from two to ten tons burden, run nearer the wind than any other, and seldom or never cast an anchor." The island has quite a long and picturesque history of its own connected with Indians, French wars, and the War of Independence, and it boasts a veritable ghost, perfectly unique of its kind. Some of us may have read the ghastly story of the ill-fated *Palatine*. It has been narrated, with variations, in verse by Whittier as well as Dana; but, as the works of these poets are not in every English library, it will be new to many to learn that regularly every year, on the day of the *Palatine's* destruction, a spectral ship in flames appears off the shore. The ghost of a burning vessel is a form of apparition the like of which we never remember to have seen. Vanderdecken is no longer the sole possessor of a spectre in timber. Every one, again, who has steamed up or down the St. Lawrence must remember the low-lying shores of that great unknown land, Anticosti, where, once in a way, an Englishman or American spends a summer in fishing and shooting, but which otherwise is left altogether alone and neglected. It is a hundred and twenty miles long and thirty wide; its soil is fertile; it has great rivers swarming with salmon and trout; it has wide forests; there is bear-hunting and there are foxes and martens; its climate is severe, but not apparently worse than that of the province of Quebec, where a good many *habitués* manage to get along. The whole population of this great island is stated by Mr. Lanman to be a hundred; another authority makes it forty; and its resources are entirely undeveloped. The island has, however, a hero, about whose name stories are gathering, quite according to the scientific development of legend; they would already, says Mr. Lanman, fill a volume. The name of this demigod was Louis Gamache; he was born in 1790, and spent twenty years of his life as a sailor; then he tried business of some kind at the little Canadian watering-place of Rimouski on the Gaspé shore. Failing in this pursuit, he became misanthropic, and went across the water to Anticosti, where he lived for the rest of his life. He married there; his first wife was quickly killed by the cold and solitude; his second was frozen to death with his two children. Then he cared not for any further intercourse with men, but lived alone with a half-bred Frenchman for his only companion. It is difficult from the selection of the stories made by Mr. Lanman to understand how he achieved his reputation of ogre, pirate, hermit, and wizard. But then Mr. Lanman is better when he talks about places than when he tells stories. The interesting fact remains that Anticosti is provided for all time with its hero of legend.

There is also a chapter in the book on "Forest Recollections," which makes one realize in some measure how North America is still, after all these years of clearings and settlements, covered from North to South by thick forests, which vary in character with every State and every degree of latitude. Thus there are the live-oak forests of Florida:—

The trees grow to a great size, are peculiar for the number of their limbs and for being free from astringent acids; and having congregated into a colony, other trees of various kinds seem to have gathered around them for protection; and as they all stand with branches interlocked, the oaks wave their magnificent grey mosses against the sky, while jessamines and other vines in wonderful profusion spread themselves into fantastic festoons and fill the surrounding air with a grateful fragrance. The birds are also very numerous, and, vying with each other in their sweet singing, inspire the heart of the listener with delight; and as he passes out into the barren woods, now more barren than before, he feels that he has had a glimpse, at least, of a scene allied to Paradise.

Again, there are the cypress forests of the Southern States:—

The American cypress is a different species from that which has acquired a mournful celebrity in Europe. It is more stupendous in size, growing out of a submerged soil, rearing its cone-shaped form to the height of two hundred feet, at the top of which it spreads great masses of horizontal branches, dense and fragrant. It delights to wrap itself in the heavy and hoary robes of flowing moss, which seems to vie with the cypress in growth, the one stretching aspiringly up, and the other mournfully down, as if finding solace in the companionship of the giant trees.

Then there are the "pine barrens" of North Carolina; there are the maple woods which grow all over America, colouring all its hill-sides in autumn with crimson and golden hues; there are the countless oaks covered with pines in the North; there are the cotton-wood

forests of the Lower Mississippi; there are the "oak openings" of Michigan; the red-wood forests of California; and, to mention no more, that remarkable district of Ohio called the Black Swamp, where the trees grow to a height of one hundred and seventy feet, all close together, so as to exclude the light, with their roots in a thick black soil partly submerged in water; this is, alone of all the forests mentioned by our author, not attractive. One feels as if even the Great Dismal Swamp itself, where there is at least light and air, with the pleasant smell of the pines, would be preferable.

Mr. Lanman takes us to other strange places; to the port where ships monopolize the trade in sea-elephant oil; they go for their cargoes to "Desolation," a name which applies to the islands south of Kerguelen, and which appear to be about as cheerless a spot to winter in as even Mark Tapley would desire. We are also taken to the salmon fishing on the Jacques Cartier River, near Quebec, which ought to be better known to English sportsmen; to the Potomac; to Montauk Point, which certainly seems to be what the author describes it—"the pleasantest place in the world"; to Gardiner's Island, near Block Island; to the quiet old town of Stratford-on-Housatonic, with its little literary history; and a dozen other places of which none of us know anything. Again, there are, even in the States, men who have failed. America is not for every one a country paved with gold. Probably success is as difficult, and requires as much ability, courage, and quick sight, in the States as at home. Naturally, we hear little of the men who have not succeeded. Like the bent pins and the broken needles, they vanish and are no more seen. But we learn from Mr. Lanman what becomes of some of them. They enter the Civil Service at Washington, where the clerks form the largest part of the population. The service is regarded as a refuge for the destitute; among those employed in the various departments are men who have lost their fortunes, and men who have made their one bid for success and failed; men who would have been great scholars, poets, painters, novelists, and what not, but have not succeeded in impressing their greatness on the world; women who have "come down"; women who are widowed and orphaned; young men who use the service as a stepping-stone to a more ambitious pursuit. They are hard-worked, and have long hours; they enjoy no social position; their pay is small; their stay in the service is no longer than they find unavoidable. Certainly, had one the choice, Somerset House is better than Washington. Some of the bitterness in Mr. Lanman's sketch looks like the result of personal experience.

The book is written in a quiet, faithful style. Mr. Lanman never tries to be funny, or brilliant, or epigrammatic, or fine; but he conscientiously notes down all that he has seen and what he knows. We were not, we confess, previously acquainted with his name; but an anonymous writer in a preface tells us all about him. He has been, it appears, successively journalist, editor, librarian, and "Examiner of Depositories"; he has always been an angler, an artist, and an enthusiastic tramp; he is now American Secretary of the Japanese Legation at Washington. He has written a quantity of books, some of them reminiscences of journeys, some of the biographical, official, directory kind; and is evidently a man of great industry, patience, and activity, with an eye for scenery, colour, sunshine, and form. If he had been born in England, he would have become a leading member of a local Archaeological Society, and would have been great on county history. We are much obliged to him for a pleasant and instructive volume.

#### CHRISTMAS BOOKS.

VI.

*ROUND the Yule Log* is a collection of Norwegian folk and fairy tales, collected by Asbjørnsen and translated by Mr. H. L. Brækstad (Sampson Low and Co.). Mr. E. W. Gosse contributes a brief preface, with an interesting biographical account of Peter Christen Asbjørnsen. He was born in 1812, and before he was twenty years old he and his friend Moe, now Bishop of Christianssand, began to collect and write down the tales which Norwegian peasants tell round the fire in the winter evenings. In 1838 Asbjørnsen published a few of his gleanings. *Norwegian Folk and Fairy Tales* saw the light in 1842; a new selection, written by Asbjørnsen, appeared in 1871; and there have been two other volumes about the "nymphs or sirens which haunt the high sparse woods and mountain dairies." A siren seems rather out of her element so far from the sea, but the Norse *Huldre* probably answer better to our fairies and the *Nereids* of modern Greece. The stories in *Round the Yule Log* are translated by Mr. Brækstad from four of these Norwegian collections. Sir G. W. Dasent has already made English nurseries and English students of the comparative mythology of European peasants familiar with many Scandinavian fairy tales. Sir George Dasent's first volume, *Tales from the Norse*, translated or paraphrased from Asbjørnsen and Moe, was almost the best fairy-tale book extant in English; and the preface is not even now superannuated, after all the collections that have since been made in Russia, Italy, Greece, Zululand, Spain, and all the theories of *märchen* that have been published. The *Tales from the Norse* are now, we believe, and have for some time been, out of print. Meanwhile the tales rendered into English by Mr. Brækstad may be most heartily recommended both to children and to amateurs of story-comparing. The devil among the Norwegian peasants has fallen heir to many of the qualities of trolls and of the lesser imps

in German tales. Thus he is induced by a boy to get into a hollow nut, and, like the spirit beguiled by Virgilus the enchanter, he cannot get out again. "The Man who was Going to Mind the House" is one of the comic, not a sample of the supernatural tales, common to all the peasants of Europe, perhaps of Asia. "The Giant who had no Heart" is a fine variant of a fairy-tale so old that it was traditional in the Egypt of Ramses II. In this tale comes Askeladen, "the youngest son, a sort of male Cinderella." The conjecture may be hazarded that Askeladen represented the youngest child to whom, by the custom of "Junior-right," the family hearth comes as heritage on the death of the father. The youngest son is the successful son in a Scythian *märchen* preserved by Herodotus. In this same story comes an incident familiar in the lore of the African Namaquas, where an elephant plays the part of the Giant; and here, too, is an expression which *Æschylus* puts into the mouth of his Eumenides. The same story has its Scotch parallel in *Nicht, Nought, Nothing*, in the Celtic *Battle of the Birds*, and in the Russian *Tear Morskoï*. So story-comparers ought to be happy enough in the company of "The Giant who had no Heart," or, at least, no heart in his body. Children will find his legend most exciting, and this is only an example, chosen at random, of what Mr. Brækstad has to offer them. In short, this book, with its very varied contents, may be recommended as likely to prove an acceptable present in most houses.

*The Great Historic Galleries of England* (edited by Lord Ronald Gower. Sampson Low and Co.) is a splendid and desirable gift-book. Photography has reproduced an exquisite group of miniatures for the frontispiece with surprising success. Here is the famous Georgiana, Duchess of Devonshire, thrice repeated; and there are some beautiful ladies of the house of Howard in her company. There are not less interesting, but far older, miniatures of Elizabeth's time, by Isaac Oliver; and many others of the age of Louis XIV., remarkable for breadth combined with extraordinary minuteness. Miniatures by Holbein too, portraits of Henry VIII., Catherine Howard, and others, have great historical as well as artistic interest. We also admire a beautiful reproduction of Reynolds's "George Howard, Lord Morpeth," in spite of the surface cracks and blisters. Grouse, Mantegna, Romney, and Gainsborough are all represented by well-chosen examples; but the Stuart, Tudor, and other miniatures make the chief value and distinction of the book.

Messrs. Paul, Trench, and Co. publish an illustrated edition of Lord Lytton's *Lucie*, a poem dear to Miss Braddon's heroines. The drawings are designed and engraved by American artists. The designer of the woodcut on p. 179 has clearly never seen a roulette-table, nor has he succeeded in reproducing one from his inner consciousness. He has drawn a very narrow table, unmarked, and covered with a table-cloth. The company are behaving as they never do in real life. Some of the landscapes are graceful, and all are quite worthy of the art of the poem.

*The Etcher* (Sampson Low and Co.) contains thirty-six examples of the original etched work of modern artists. M. Lhermitte's "La Boucherie" is a vigorous and legitimate success. Mr. Slcombe's haymaking girl is what the poet calls a "too-too woman," rather too prettily drooping. Mr. Ball's "Benfleet Marsh" is a beautiful pensive English scene, and Mr. Watson has an agreeable reminiscence of Meryon. Mr. Strang is clearly a pupil of M. Le Gros's, and a very clever pupil, too. In short, this is a pleasant collection of clever works in black and white.

*Men of Mark* (same publishers) contains many lifelike effigies of distinguished people, priests, politicians, judges, soldiers, artists, but no authors, except Mr. Gladstone and the Dean of St. Paul's, who are authors in their hours of leisure, and Serjeant Ballantine, who is about to sacrifice to the literary Muse of memoirs.

*In Times of Peril: a Tale of India* (G. A. Henty. Griffith and Farran).—The "times of peril" referred to were those of the Mutiny. Mr. Henty has described the horrors with spirit, and can interest us anew even in the details of Lucknow and Cawnpore, which we all know so well. Warfare is, it would seem however, no barrier to love-making. The two young ladies of the party become engaged just at the outbreak of the Mutiny; their two brothers fall in love with two sisters during the siege of Lucknow; and on the return of the two families to England the heads of both become united in matrimony. The story would have been quite as good had some of these rather promiscuous weddings been left out. The characters get sunk in the adventures, and who can be interested in persons who are invariably bracketed as "Captains Dunlop and Manners"?

*How Willy became a Hero* (Author of "Clarey's Confirmation," &c. S.P.O.K.).—This small book has a good deal of merit in many ways, but it is spoilt by the preternatural virtue of its hero. Not only does he behave like an angel, after a very short struggle, to a boy who has been extremely disagreeable to him, but a few years later he gives up a chance of getting a scholarship at a public school for the sake of giving his little sister the air and exercise necessary to her health. Nor is this all; for when he is grown up and has absolutely gained a scholarship at Cambridge, he is a second time forced to put his desires aside and accept a clerkship, as his father has most inopportunistically injured his hand and cannot work himself. Surely no boy was ever so unfortun-

ate. Smith).—The story at the beginning of this book is evidently intended for very small children, for whom it is very suitable; but the two other tales are more complicated and theological, and do not harmonize well with "Cheap Jack." This is the greater pity, as simple stories which little children can read to themselves are much needed.

*Young Marmaduke: a Story of the Reign of Terror* (W. H. Davenport Adams. Marcus Ward).—It is hardly possible that any incidents of the French Revolution should be dull, and they have certainly not become so in the hands of Mr. Davenport Adams. He has drawn a vivid picture of the perils of a young Englishman in Paris in '94, and of the scenes he saw and took part in. Of course, in the end his hero escapes and returns to England.

*Notsam and Jetsam* (H. Wothem. Griffith and Farran).—It seems hardly worth while to bring a little boy all the way from India merely to lose him at Paddington Station for about twenty years. This, however, was the fate of Jack Armstrong, who, aided by his virtues, fell upon his feet, and made as good a thing of his life as if he had been delivered straight into the hands of his uncle at Berwick. Better, indeed; for his younger brother, who arrived safely at his destination, took to bad ways and was looked coldly upon by his family.

*Dorothy: or, Getting One's Own Way* (Ger. Mowbray and Co.).—Dorothy was a young person who, after conducting herself properly and pleasantly for many years, suddenly took a naughty fit, refused to learn her lessons, told fibs, and was cross to her nurse and governess. It needed many months of lying down to restore her to her original pinnacle of virtue.

*Holiday-Time at Forest-House* (Illustrated by T. Pym. Marcus Ward).—The illustrations to this small book are superior to the ordinary run, and perhaps the same may be said of the letter-press. The excitement of the holiday-time was made up of the small trifles that seem so important to children, and in which their grown-up belongings are forced to take an interest. The language is simple and natural.

*Aunt Kexia's Will* (S. M. Sitwell. S.P.O.K.).—The "will" was not, as might be supposed, Aunt Kexia's testamentary disposition of her property, but her resolute frame of mind, only softened by the charms of her little blind niece. The story is prettily told and well adapted for reading to the poor.

We have to acknowledge *Old Nursery Songs* (Warne and Co.), and the *Children's Kettle Drum* (Dean and Son), both copiously, rather than cleverly, illustrated.

#### AMERICAN LITERATURE.

THE centenary celebration of American independence has produced a multitude of publications more or less valuable in their way, and the harvest, it seems, is not yet completely gleaned. We have received this month two books dealing at no little length with separate portions of the War of Independence. It is curious and somewhat characteristic that by very far the smaller and less pretentious of these is that which relates the critical events of the final campaign, the struggle which, terminating in the surrender of Lord Cornwallis at Yorktown, practically compelled Great Britain forthwith to abandon her endeavour to reclaim her American possessions. The story is not ill told, and possesses a permanent historical interest. No historian, certainly no school of historians, not even the whitewashers of our own day, has falsified facts and misrepresented the course of events so systematically as have the annalists of the United States. In truth, till the Civil War, they had so little in the way of military glory to boast of, that not only did they make the very most of every trifling success obtained, and minimize the assistance received from allies or from fortune, but they naturally saw all American wars through such spectacles as those of the Spanish *hidalgo* who desired to magnify cherries to the size of plums. Even in dealing with the Civil War Northern writers, almost without exception, studiously keep out of view the great fact which renders the Northern victory somewhat inglorious in European eyes. Except where vast distances prevent its bringing its force really to bear, no European nation would dream of boasting very loudly of a conquest, no matter how complete, effected by a Power outnumbering its opponents by three or four to one, and possessing resources even more disproportionate than its numbers. But in the War of Independence the colonists were engaged with one of the first Powers of the world, and were long prone to boast that "The British can whip all the world, and we can whip the British." That they were no more opposed in 1780 than in 1812 to the whole force of Great Britain few American schoolboys know, and only the best-educated of American citizens remember. That it was not by her colonies, but by France and Spain united with them, that Great Britain was at last overcome, is a fact which no historian of the Yorktown campaign can well ignore, and which in one of the volumes before us (1) is so clearly brought out that even American readers can hardly fail to recognize it. Washington's previous successes were, no doubt, highly valuable to him; though those who have studied the original documents of the time are often inclined to think that one-half the

For particulars apply to the Lady Principal, Miss DANIELS, Fulham Road, W. 11, or to Messrs. Harper & Brothers, 176 around New

glory of the Commander-in-chief is derived from the disgrace or discredit of his countrymen, and much of the rest from the imbecility of too many of the British commanders. Wellington's despatches are full of complaints of his Spanish allies and of the deficient support received from the Government at home. Washington bears testimony, equally emphatic, to the wavering loyalty of his troops, to the frequent meanness of the States, and to the incapacity of Congress. His chief ally, no doubt, was the three thousand miles of sea that intervened between the British forces and their real base. Only while that vast ocean, then practically six times as wide as now, was commanded by British fleets was the maintenance of war at such a distance really practicable. From the moment when Great Britain was opposed at sea to the combined fleets of France and Spain, greatly outnumbering her own, as well as to the combined forces of France and America on land, did the struggle visibly become hopeless. It was rather by Rochambeau than by Washington that Cornwallis was forced to surrender. And there is one other impression which a careful perusal of the story told from an American standpoint in the volume before us must leave, we think, upon every impartial mind. Had Lord Cornwallis commanded from the first the British armies beyond the Atlantic, it is not improbable that the fortune of the struggle might have been very different and its event reversed. The other volume before us (2) records with extreme and almost absurd minuteness a single third-rate engagement between local forces on the borders of the Carolinas. It throws incidentally a striking light upon a fact too generally minimized, if not forgotten, by American historians, and thoroughly overlooked by those Englishmen who take sometimes a chivalrous, sometimes a simply unpatriotic, pleasure in exalting the victories gained by the Americans in the cause of freedom and nationality. That fact is that the term we have employed was at the time wholly inapplicable to our antagonist. We had to deal, not with the American people, but with rebels. Our Transatlantic enemies were rebels, not merely because they bore arms against their legitimate sovereign, but because they were a faction, though a majority, and not a people. There were in the colonies, and especially in the South, Loyalists by the thousand, whom England never knew how to utilize and whom she requited with signal ingratitude. Their story is the story of the Transvaal loyalists written in yet more striking characters and on a far larger scale. The true heroes of King's Mountain were not the superior force of rebels who assailed the gallant little band of loyalists, but those who stood up against overwhelming numbers for the King and for the law, and whom the present historian of the conflict overwhelms with abuse. Even his bitter prejudice cannot conceal the truth that, whereas any decent soldiers or militia would have done all that was done by the conquerors, the party at last overwhelmed by numbers displayed signal courage and conduct. That the so-called Tories were guilty of many cruel and lawless acts, no rational man will deny. But it is equally undeniable that for one crime committed by them fifty were perpetrated upon them, and that the treatment of the loyalists leaves a stain upon the character of the American nation, upon more than one of its favourite generals, and upon its Congress. It must be remembered that those who fight for the law, for their Sovereign, and for the flag under which they were born, are always individually in the right. It is always a question whether rebellion be or be not justifiable, but it can never be a question whether men have a right to do their utmost to hold by the sword the privileges and the nationality to which they are entitled by law and by birth; and in treating loyal subjects of King George as traitors to Congress, the American revolutionists violated every principle of civilized war. It is only for the light it throws upon this aspect of the struggle that the volume upon the combat of King's Mountain deserves the slightest attention. The incident in itself was trivial, little more than a local skirmish, having no bearing whatever upon the general fortunes of the war; and the expansion of its story into a heavy octavo volume is one of the most monstrous of those exaggerations which characterize American history.

We have to notice two small volumes evidently intended as parts of a somewhat lengthy series of Campaigns of the Civil War. Mr. Nicolay deals with *The Outbreak of the Rebellion* (3) in the language of a man who has learnt nothing and forgotten nothing, repeating all the nonsense about treason and conspiracy which at the outset of the conflict was in vogue among fanatic Federalists, but which certainly neither Mr. Seward nor Mr. Lincoln—hardly any man of intelligence in the party—freely as they used it, believed for a moment. All the discussions that preceded secession were carried on with as much publicity as if there had been no more doubt of the practical power than of the technical right of Sovereign States to dissolve the Union. Mr. Nicolay has not the excuse of those who first gave currency to these expressions of sectional and party animosity. The unanimous adhesion of the Southern people to the vote of the majority in each State not merely refuted such charges, but rendered them ridiculous. Never was a nation more unanimous; and a conspiracy of six millions of people, of four hundred thousand

volunteer soldiers, is something more than a contradiction in terms. What may be expected from a writer capable of repeating such petulant absurdities after twenty years of reflection no one can well doubt. But Mr. Nicolay's language is not his worst offence. His misrepresentations of fact are as monstrous as his misuse of words. Throughout he strives to represent a great national movement as the fruit of the selfish intrigues of a few exasperated politicians; and the result is that those who have read nothing whatever about the matter will know more than those who take their views on trust from a work like this. It is a public misfortune that from such party pamphlets the rising generation of Americans should derive their conception of the greatest event in their history, and their estimate of a section of their countrymen of whom any country might well be proud. General Force's story of the Western Campaign, from the capture of Fort Henry to the battle of Corinth (4), has at least the merit of brevity, and gives perhaps as good an idea of the general outlines of that most important portion of the conflict as could be afforded in so small a space. No part of the Civil War was, from a military point of view, more interesting or more momentous. The campaigns in Virginia were not only dishonourable, but disastrous to the North. Not a single victory, save that of Gettysburg, was won by the Army of the Potomac from Manassas to Five Forks; and the capture of Richmond would, save on political grounds, have been at an earlier period, before the army of Northern Virginia was shut up within the lines and cut off from retreat to the southward, a matter of secondary moment. The fate of the war really turned on the power of the Confederates to hold the line of the Mississippi. That they could not do this, that the cutting of the Confederacy in twain was a mere matter of time, was demonstrated when the Southern army was driven back step by step from Southern Kentucky to Northern Alabama.

The charge of undue brevity cannot be made against the enormous volume of eleven hundred pages in which Dr. Brackett has described in minute detail the glories of *Our Western Empire* (5). The subject is as big as the volume, and the treatment almost as heavy. In truth, the gigantic size of their domain presses strangely on the American imagination. Scarcely any Transatlantic philosopher's mind is strong enough, scarcely any poet's spirit is sufficiently original and independent, to clear itself of this oppressive sense of mere size. From Mr. Lowell down to the dullest stump orator of his native State, every American seems to have prairie on the brain. After all, no small part of this gigantic area is almost as worthless as the Sahara. American pride in the Alkali Desert is scarcely less ridiculous than would be a negro's vaunting of that vast African sea of sand. But on every side of that salt waste lie great regions in whose praise a poet may well be eloquent. The varied beauty and grandeur of the scenery, the wide range of climate, the multifarious character and inexhaustible mass of resources of every kind, the natural wealth of the Pacific coast, cannot be fully set forth even in so monstrous a volume as the one before us; and the western half of the valley of the Mississippi, though far tamer and more monotonous in character, is in its way a scarcely less magnificent subject of contemplation. But the author has done his best to dwarf his subject and weary his readers. He has gone into every petty detail at tedious length, and the accumulation of facts which in themselves are useful and even interesting becomes insufferably wearisome before the reader has got through half a dozen of the fifty chapters. All that can be said of every form of agriculture actually practised or capable of being introduced, of every form of mine, of ranches with their thousands of cattle, of prairies wholly occupied by the vast wheat-fields of a single owner, of mountain, lake, and river, rock and desert, giant falls and boiling sulphur-springs, giant trees, and precipices two thousand feet in sheer descent, the author is careful to say, and leave nothing unsaid. The result is that the book reads like a catalogue or inventory, magnified on a truly American scale, and becomes too ponderous for perusal and too clumsy for reference.

It was certainly right and useful to print a journal of the debates which passed in the first Senate of the United States (6). The existence of such a document sufficiently justifies its preservation, and renders its publication a service to posterity. But with the work itself we are, we confess, somewhat disappointed. It is at best merely a fragment of those materials for history in which the last two centuries so abound that the historian's difficulty can never be to find, but rather to sift, from among the enormous mass what he has leisure to peruse and cannot afford to omit. Nine-tenths of the matter which Senator Maclay so carefully preserved has already lost all interest or value even for the historian. Here and there, perhaps, a dozen consecutive pages are worth reading, though even these are wearisome. But, despite the entertaining scenes it records, and the view it gives us of the first development of constitutional politics in the States, it is a book that in these days no man has time to read or would care to remember. The subjects of discussion were for the

(4) *From Fort Henry to Corinth*. By M. F. Force, late Brigadier-General U.S.V. New York: S. Scribner's Sons. London: Trübner & Co. 1882.

(5) *Our Western Empire; or, the New West beyond the Mississippi*. By L. P. Smalley, A.M., M.D. Illustrated. Philadelphia: Bradley, Gardner, & Co. 1882.

(1) *King's Mountain and its Heroes: History of the Battle of King's Mountain, October 7, 1780, and the events which led to it*. By L. C. Draper, LL.D. New York: Scribner's Sons. 1881.

(3) *The Outbreak of the Rebellion*. By Mr. Nicolay. New York: Trübner & Co. 1881.

most part trivial; and the debates to which they gave rise are recorded at excessive and disproportionate length. One of the most exciting and readable of these arose on the question whether the President should be called "His Highness" or "His Excellency," or should bear no distinctive title whatever; and the Republican Benthamist nonsense talked on the one side is hardly more contemptible than the arguments employed to vindicate the maintenance of official rank and dignity on the other.

*From Canal Boy to President* (7) is the kind of sensational title that appeals to the popular taste of American readers, and fairly indicates the author's treatment of General Garfield's career. There can be little doubt that, whatever the disadvantages against which a poor and ambitious man has to struggle in the United States, as elsewhere, during the earlier stages of his upward progress, an ex-rail-splitter or ex-ploughboy has in the latter portion of his life great and almost countervailing advantages. It was no trivial weight in the Republican scale that General Hancock was by birth and education a gentleman, and that his opponent was a self-educated man. Nevertheless, the career of General Garfield reflected no little honour on one who, like so many of the leading spirits of America in every department of life, rose literally from the ranks, and, unlike too many of his contemporaries, rose by means as creditable as the end. The book will be doubtless interesting to ambitious and clever English youths; and, if not politically instructive nor biographically valuable, it is readable, and likely to leave an impression on the memory of readers young enough to be impressed by works of such a character.

Of those Shakespearian commentaries wherein American literature is as prolific as that of England or Germany we have two—a *Shakespeare Phrase-Book* (8), and a treatise on that interminable question *The Mystery of Hamlet* (9).

Of scientific and educational works, perhaps the most interesting on our list this month is that of Mr. McCurdy on the relations of the Aryan and Semitic languages (10); an elaborate endeavour to prove a common origin for the two great families of speech that took their origin in that *Officina Gentium*—the lands west of the Euphrates. Unfortunately all the words of Arabic, Hebrew, and other less familiar languages are printed only in their native character, and are unreadable therefore to all but professed students of Oriental tongues. This is likely, we fear, to hinder very much the circulation of a work that would otherwise have had interest for many who have studied but at second-hand the topic of the origin of human speech.

Dr. Hardy's *Elements of Quaternions* (11) and Dr. Byerly's *Integral Calculus* (12) are works of high mathematical pretension. *The Dictionary of Education* (13) is something between a handbook and an encyclopædia for the use of teachers.

Mr. Monteith's *Popular Science Reader* (14) touches hastily on all sorts of subjects interesting to schoolboys, from the habits of the salmon to the construction of the *Merrimac* and *Monitor*.

*The Brief History of Ancient Peoples* (15), published by Messrs. Barnes and Co., and Mr. Bigelow's *Handbook of Punctuation* (16) hardly belong to literature. The same may perhaps be said, from another point of view, of *Mr. Macdonald's* amazingly elaborate description of *Florida* (17), certified by official authority and evidently intended to attract settlers or visitors to one of the least developed and least known of the Southern States, one whose climate, soil, and productions bear a very exceptional character and have attractions which, whether equal or not to those of her rivals, are altogether peculiar to herself.

Mr. Glass's *World* (18) is something between a handbook and a book of travel. Mrs. Dahlgren's *South Sea Sketches* (19) are singularly miscalled, dealing almost exclusively with Chili and Peru.

(7) *From Canal Boy to President; or, the Boyhood and Manhood of James A. Garfield*. By H. Alger, jun., Author of "Ragged Dick," &c. Illustrated. New York: Anderson & Co. London: Trübner & Co. 1881.

(8) *The Shakespeare Phrase-Book*. By John Bartlett. London: Macmillan & Co. 1881.

(9) *The Mystery of Hamlet: an Attempt to Solve an Old Problem*. By Edward P. Vining. Philadelphia: Lippincott & Co. London: B. Quaritch. 1881.

(10) *Aryo-Semite Speech: a Study in Linguistic Archaeology*. By J. F. McCurdy. Andover: W. F. Draper. London: Trübner & Co. 1881.

(11) *Elements of Quaternions*. By A. S. Hardy, Ph.D. Boston: Ginn, Heath, & Co. 1881.

(12) *Elements of the Integral Calculus; with a Key to the Solution of Differential Equations*. By W. E. Byerly, Ph.D. Boston: Ginn, Heath, & Co. 1881.

(13) *The Dictionary of Education and Instruction*. By H. Kiddle and A. J. Schenck. New York: Stricker & Co. London: Sampson Low & Co. 1881.

(14) *Popular Science Reader*. By J. Monteith. New York: Barnes & Co. London: Trübner & Co. 1881.

(15) *A Brief History of Ancient Peoples; with an Account of their Monuments, Literature, and Manners*. New York: Barnes & Co. London: Trübner & Co. 1881.

(16) *Punctuation, and other Typographical Matters, for the Use of Printers, Authors, Teachers, and Scholars*. By M. T. Bigelow. Boston: Leo & Shepard. London: Trübner & Co. 1881.

(17) *Florida: for Tourists, Invalids, and Settlers*. By G. M. Barbour. Illustrated. New York: Appleton & Co. London: Trübner & Co. 1881.

(18) *The World: Round it and Over it*. By Chester Glass. Illustrated. Toronto: Rose Belford Publishing Co. 1881.

(19) *South Sea Sketches: a Narrative*. By Mrs. M. V. Dahlgren. Boston: Osgood & Co. London: Trübner & Co. 1881.

Two volumes are devoted to Spain. The first is a history by Professor Harrison (20), apparently intended for the elder classes of schools and the students of American colleges, and perhaps as full as is desirable in such a work, considering the variety and number of subjects that form the curriculum of Transatlantic education. *Spain and the Spaniards* (21) is a lively but somewhat too lengthy description of the actual present attractions, amusements, and life of the Peninsula.

Of American novels *Homoselle* (22), *My First Holiday* (23), and *The Land of Gold* (24), a tale of the earliest Californian settlers, are, on the whole, favourable examples.

(20) *Spain*. By J. A. Harrison. Illustrated. Boston: Lothrop & Co. London: Trübner & Co.

(21) *Spain and the Spaniards*. By W. W. Cade. From the Italian of E. de Amici. Illustrated. New York: G. P. Putnam's Sons. 1881.

(22) *Round Robin Series:—Homoselle*. Boston: Osgood & Co. London: Trübner & Co. 1881.

(23) *My First Holiday; or, Letters Home from Colorado, Utah, and California*. By Caroline H. Dall. Boston: Roberts Brothers. 1881.

(24) *The Land of Gold: a Tale of 49*. By G. G. Spurr. Illustrated. Boston: Wiliams & Co. London: Trübner & Co. 1881.

#### NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

## THE SATURDAY REVIEW

OF  
POLITICS, LITERATURE, SCIENCE, AND ART.

Price 6d.

#### CONTENTS OF No. 1,366, DECEMBER 31, 1881:

Politics in 1881.  
Lord Salisbury's Speech. — M. Paul Boyer and the Lib-erals.  
The Bribery Sentence. — The Pope and Italy. — Mr. Shaw and Home Rule.  
American Meat. — The Authority of Disfranchisement.  
Industrial Schools and the London School Board.

The Year.  
The Concordat of 1861 and the Occasional Articles. — Fires in Theatres.  
The Anarchy in Ireland. — Dancamp Men. — The State of the Army.  
Strange Marriage Customs. — Yachting and Yachting Rules.  
Trade Prospects.

The Encyclopædic Dictionary.  
The Visions of England. — Young Japan.  
The Dutch Consul. — Home and Hamlets of the Italian Poets.  
Records of the Past. — Between the Amazon and the Andes. — Lolo Leggath.  
Recollections of Curious Characters and Pleasant Places.  
Christmas Books.—VI. — American Literature.

#### CONTENTS OF No. 1,365, DECEMBER 24, 1881:

Egypt.—The Lodger's Complaint.—Lord Hartington in Lancashire.—The Turkish Debt.—  
The State of Ireland.—Mr. Harcourt's Speech.—M. Gambetta and the Country.—  
The London Water Company.—Railway Companies and Railway Accidents.  
Mr. Street.—Christmas Articles.—The *Jennett*.—Indian Finance.—A Romanisation of  
Complete Letter Writing.—Attendance at the Theatre.—Dangers of Electric Lighting.—  
The Westminster Play.—Limitation of Banking Liability.—Theatrical Matters.  
Deane's Book of Wisdom.—Evans's Late-ter-are Words.—Life of Sir William Gomm.  
The English Citizen.—The Rivers and Rivers of India.—Her Majesty's Pro-  
cesses.—By the Tower.—Christmas Books. V. — French Christmas Books.

London: Published at 38 SOUTHAMPTON STREET, STRAND, W.C.

## ADVERTISEMENTS.

**DORÉ'S GREAT WORKS.** "CHRIST LEAVING the PRIESTHOOD," "CHRIST ENTERING JERUSALEM," and "MOSES BEFORE PHARAOH," each 37 by 22 1/2 in. with "Decorative Plates" and "Illustrations." See at the DORÉ GALLERY, 15 New Bond Street. Daily, Ten to Six.

**THE EUROPEAN** (late New) GALLERIES, 103 New Bond Street, Sixteen doors from Oxford Street. Exhibition of FINE ART and DECORATIVE ART. Admission free this week.

T. J. GULLICK, Director.

**NEWTON HALL, Fleur-de-lis Court, FETTER LANE, E.C.**  
POSTLUVE SOCIETY. The ANNUAL ADDRESS will be given on Sunday, January 1st, at Four P.M. (or 5 P.M. if the weather is fine) by Mr. J. REBECK HARRISON, Secretary of the Society. The ADDRESS will be continued until further notice. On Sunday, January 8, 15, 22, 29, Professor BURNES, at Eight P.M. A CLASS is being formed in the Elements and History of GEOMETRY, on Wednesdays, at Eight P.M. Apply to the SECRETARY.

**THE LADIES' COLLEGE, Polygon House, SOUTHAMPTON.**  
Established by the Hampshire Association for Promoting Female Education, Limited.

*Patrons.*  
The Right Rev. the Lord Bishop of WINCHESTER.  
The Right Hon. Lord NORTHBROOK.  
The Right Hon. Viscount EVERSELEY.

*President.*—The Right Hon. Lord MOUNT-TEMPLE.

*Chairman to the Council.*  
Surgeon-General MACLEAY, M.D., C.B.

The object of the College is to provide for the Daughters of Gentlemen a sound Education at a moderate cost. A comfortable home, with good moral training, is provided for resident students. Instruction is given by Professors in Mathematics, Languages, Literature, Science, and Art. English and Foreign Governments reside at the College.  
The SPRING TERM will commence January 23 for Boarders, and January 31 for Day Students.  
For particulars apply to the Lady Principal, Miss DAVIES, Polygon House, Southampton.

SERIES OF

ANNUAL WINTER EXHIBITIONS ILLUSTRATING

THE WORKS OF THE MOST

EMINENT LIVING PAINTERS.

### HYDE PARK COLLEGE for LADIES, 116 Gloucester

*Terence, Hyde Park.*  
The JUNIOR TERM begins January 12.  
The SENIOR TERM, January 20.  
Prospectuses, containing Terms, Names of Professors, &c., may be had on application to the LADY RESIDENT.

**LANDSCAPE GARDENING.**—Planning and Improvement of Estates, Gardens, &c. Treatment of land to enhance its value by adornment, drainage, &c. STUDENTS for the profession can now be received in the CRYSTAL PALACE COMPANY'S SCHOOL OF GARDENING. Principal, Mr. EDWARD MILLNER, Crystal Palace, Sydenham. Prospectus on application in the Library.  
F. K. J. SHENTON, Superintendent Literary Department.

### ROYAL AGRICULTURAL COLLEGE, OIRENOESTER.

Established by Royal Charter, 1845.  
FOR THE SCIENCE AND PRACTICE OF AGRICULTURE.  
For intending Land Owners and Occupiers, Land Agents, Surveyors, Colonists, &c.  
The COLLEGE FARM, for the practical instruction of the Students, surrounds the College, and is a mixed Farm of about 200 Acres.  
Resident—His Grace the Duke of MARLBOROUGH, K.G.

*Committee of Management.*  
The Right Hon. the Earl of DUCIE, Chairman.  
The Right Hon. the Earl BATHURST.  
The Right Hon. Sir MICHAEL E. HICKS-BEACH, Bart., M.P.  
Lieut.-Col. H. NIGEL F. KINGSCOTE, C.B., M.P.  
GEORGE T. J. SOTHERON-ESTCOURT, Esq., M.P.  
AMBROSE L. GODDARD, Esq.  
EDWARD BOWLY, Esq.  
WILLIAM JOHN EDMONDS, Esq.  
Major T. W. CHESTER MANTER, M.P.  
For Prospectus of COLLEGE and FARM, List of Scholarships, Prizes, Diplomas, &c. apply to the PRINCIPAL.  
NEXT SESSION begins January 31.

### BRIGHTON COLLEGE.

Principal—Rev. T. HAYES BELOHER, M.A., Queen's College, Oxford.  
Vice-Principal—Rev. J. NEWTON, M.A., St. John's College, Cambridge.  
A special Army Class, in which preparation is made for Sandhurst, Woolwich, Cooper's Hill, and Indian Civil Service, has been in active work for some time. The course of instruction The NEXT TERM will commence on Friday, January 27.

F. W. MADDEN, M.R.A.S., Secretary.

### DOVER COLLEGE.

President—Earl GRANVILLE, K.G.  
Next Term will commence on January 18. Board, £400. Tuition from 12 to 18 Guineas.  
For particulars apply to the Rev. W. BELL, M.A., the Head Master, or W. KROCKEN, Esq., the Honorary Secretary.

**SOMERSETSHIRE COLLEGE, BATH.**—The College is divided into Classical and Modern sides. BOARDERS are taken in the Senior Department by the Head-Master in the Junior Department by the Rev. PHILIP CURRY, M.A. Special attention is given to Delicate or Backward Boys.—For Prospectus, List of Honours, &c., apply to the Head-Master, T. M. BROMLEY, M.A.

### KELLY COLLEGE, TAVISTOCK, South Devon.

Chairman of Trustees: The Right Hon. the Earl of DEVON.  
Head-Master: ROBERT W. TAYLOR, M.A. (Formerly Fellow of St. John's College, Cambridge, 17th Wrangler and 5th Classic 1860).  
BOYS prepared for the Universities, the Army, Navy, and Civil Service Examinations, and the Professions. Large airy buildings, healthy and bracing position, facing Dartmoor, spacious playground, home comforts. Inclusive Fees for Boarders, £24 per Term. NEXT TERM commences January 20, 1882. For Prospectus, &c., apply to the HEAD-MASTER.

### ISLE OF WIGHT COLLEGE, RYDE.

THREE ENTRANCE SCHOLARSHIPS.  
The NEXT TERM begins January 20th.  
For particulars apply to the HEAD-MASTER.

### TRINITY COLLEGE SCHOOL, STRATFORD-ON-AVON.

Founded by the Rev. J. D. COLLIS, D.D. The Warden, RICHARD F. CURRY, M.A., is assisted by Seven Resident Masters. Classical and Modern Sides. Preparation for the Universities and all competitive Examinations. Special Classes for the Army Examinations. Great attention paid to Modern Languages. Junior Department for Young Boys. Large Playing Fields, Gymnasium, Five Courts, &c. &c. Terms 20 and 20 Guineas per annum.—Apply to the WARDEN.

### ST. ANDREW'S COLLEGE, CHARISTONCK, Dorset.

Terms moderate and inclusive. NEXT TERM begins January 27, 1882.—Apply to School SECRETARY.

### MALVERN COLLEGE.

The NEXT TERM commences on Friday, January 27. Entrance Examinations on January 26.—For particulars apply to HENRY ALDRICH, Esq., Secretary.

### VICTORIA COLLEGE, JERSEY.

—A Public School, with special advantages of climate and unusual opportunities of acquiring modern Languages. Board and tuition in no case exceed £70 a year.—Principal, R. HALLIDAY CHAMBERS, M.A., with ten Assistant Masters.

### ST. MARYLEBONE and ALL SOULS' GRAMMAR SCHOOLS.

(in union with King's College). The NEXT TERM commences on January 25.—For Prospectus and all information apply to the SECRETARY, 1 Cornwall Terrace, Regent's Park, N.W.

### AMESBURY HOUSE, PAGE HEATH, BICKLEY, Kent.

Rev. EDMUND FOWLE receives THIRTY-THREE BOYS under the age of Fifteen, to prepare for the Public Schools.

The house, surrounded by six acres of land, is situated in a charming locality, thirteen miles from London.

There is every requirement for a high-class Private School, a cricket and football ground, large iron play-room, forming gymnasium, &c., two Eton five-courts, workshop, dry playground, and a run of a third of a mile on a dry gravel path.

Every Educational advantage given, and many comforts offered, the greatest care being taken of little Boys on their first leaving home.

Great success has been met with, several Open Scholarships gained, and in no single case has a Boy failed to take his proper place at a public school.

Rev. EDMUND FOWLE is the author of a very successful series of Latin and Greek School Books, one of which was written by special request, for use at Eton, and has been adopted also at Harrow, Merchant Taylors, &c.

### WIMBLEDON SCHOOL.

—This School, established principally for the Education of those intended for the Army, affords special means of Preparation for the different Military and Naval Competitive Appointments.

An unusually large staff of Masters enables each Pupil to receive complete individual instruction and attention.

For the last twenty years the yearly average number of Successful Candidates who have passed direct from this School for Woolwich, Sandhurst, and the Line has been 17.

The NEXT TERM commences on Tuesday, January 17.

For further particulars, apply to either of the Head-Masters, the Rev. J. M. DRACKENBURY or the Rev. G. J. WYNN, Wimbledon School, Surrey.

### MORNING PREPARATORY CLASS for the SONS of

the GENTLEMEN (nominally) to Somerset Street, Portman Square, W. The NEXT TERM commences on Tuesday, January 17. New Pupils, 15; Kindergarten and Transition
